At the beginning of every year, the factory's board and managers determine the length of the upcoming crushing season which ranges between 180-220 days. This, together with the crushing capacity (5,000 mt/day) determines the quantity of cane required by the factory (10,00,000 mt). At an average yield of 40 mt/acre, thus the factory needs to bring some 26,250 acres of its members' land under cane. If the cane area of the members falls far short of this requirement, the factory runs the risk of low capacity utilisation, high average crushing costs and low cane prices to members; on the other hand, if, in the absence of effective co-ordination, members plant much larger area with cane, then the factory will have to reject a large output of cane which will have to find less remunerative markets in kolbu wallahs and khandsari units.

The second crucial logistical issue is of ensuring the right scheduling of arrival of cane at the factory gates on a daily basis so as to match the crushing schedule of the factory. Cane is perishable in the sense that once harvested, its sucrose content rapidly declines if not crushed within 24 hours. Without co-ordination, cane arrivals are likely to be higher than peak crushing capacity during the middle of the crushing season and lower during the beginning and the end of the season.

Attwood and Baviskar have shown that neither the cane supply unions of Uttar Pradesh nor private sugar factories have satisfactorily resolved either of these logistical problems. In a study of Bagpat cane supply union in Uttar Pradesh, for example, Batra (1988) has highlighted how inability to match cane supplies with crushing capacity and harvesting schedule with crushing schedule made it impossible for the union to compete with kolbus and khandsari units. Baviskar and Attwood have also shown that sugar co-operatives ensure that members plant the 'right' acreage with cane by linking cane supply rights with share holdings; and they ensure the 'right' harvesting schedule through centralised harvesting and transport operation.

In Chalthan, for instance, each of the total of 19,000 shares held by the members is entitled to 1.38 acres of cane area or 'ropan' in local parlance. Over years of experience, the co-operative managers have realised that only 90 per cent of the ropan allocations actually result in planting. Therefore, the ropan entitlement per share is adjusted upwards to 1.53 acres (1.38/0.9). Further, since one ratoon crop is allowed, the existing fresh plantation area against each share is deducted from this adjusted allocation to compute the new area a member can plant with cane during the season.

The month in which planting is to be done too is a major issue for the farmers and is therefore determined by the co-operative. October plantation is most preferred primarily because it releases land for an additional short-duration crop; December is the least preferred. In Chalthan, about 35 per cent of the total ropan is for plantation in October; another 35 per cent is for November plantation and the remaining 30 per cent is for December. Most of the cases of unused ropans are from December allocations. The co-operative asks members to list their requests for October plantation; a lottery is used to assign the scarce October ropan to members; the losers are automatically shifted to November ropan. For this too, there is often a lottery; and those who lose in this too get pushed to December ropan. That this arrangement is not satisfactory is evident from the high incidence of intentional burning of cane by late planting farmers which obliges the co-operative to harvest the cane before the due date. This interesting problem has been discussed by Manoharan (1989).

Most farmers are members of more than one sugar co-operative. They receive their ropan allocations from different factories by April every year and have to make their final planting commitments by August. Until then, each co-operative permits certain kinds of transactions in these ropan rights, and in shares themselves—to which ropan rights are linked and which derive all their significance and value from this linkage.

The market in these rights serve many needs of the members as well as the factory. Some farmers may have cornered more shares than they have land or plan to plant with cane; some may not want a particular month's ropan; they may not want to cultivate cane that year; many may have no share at all but want to grow cane for the factory. Therefore, farmers enter into all manners of exchange arrangements. Besides members, these exchanges help the factory management ensure that the bulk of the ropan allotted results in plantation.

Why do members subject themselves to such stringent discipline and tight regimen? After all, sugar-cane is very intensive in working capital; it locks up land for at least two years each time it is planted. Like cotton a decade earlier, sugar-cane too has been increasingly prone to pest attacks. The two major diseases that hit sugar-cane are white fly and root wilt. Root wilt has no known treatment and may halve the yield of a plantation crop to 20 mt/acre and that of the first ratoon to 5-10 mt/acre.

In spite of these problems, farmers in south Gujarat continue growing sugar-cane under the strict regimen imposed by their co-operatives because sugar-cane continues to offer to them the best economic deal. Our quick estimates for Chalthan suggested that in 1991, Rs 10,500/acre was approximately the cost of planting a fresh cane crop, and Rs 4,500/acre was the cost of raising a ratoon crop. Against this, the farmer got an output of 80 mt/acre over two crops (45 mt for plantation and 35 mt in ratoon). At a rate Rs 450-500/ mt, thus a Chalthan sugar co-operative member grossed around Rs 36,000-40,000/acre over the two-year period. This compared exceedingly well with Rs 12,000-15,000/year gross per acre from alternative crops.

Additional considerations in favour of sugar-cane were the relatively low family labour requirement. The farmers' primary responsibility is for ensuring timely irrigation. Though canal irrigation is available, several farmers in Chalthan's command had also invested in their own tube-wells and submersible pumps to take advantage of the system of flat rate of electricity charges and because of the rising ground water levels. The tube-wells also offered farmers greater control over the quantum and timing of irrigation. The exact cost of irrigation varied significantly over the command area, depending on source, depth of water-table, source of energy, fragmentation in total holdings, etc.

Harvesting, transport and marketing are critical operations for cane farmers everywhere. For members of co-operative sugar factories in south Gujarat, these are looked after by the factory. On an average, the Chalthan factory spends Rs 35/ ton on harvesting labour and another Rs 35/ton on transport. The co-operative schedules the harvest generally on the basis of plantation date and variety (early, mid-late, late, etc). There are some minor adjustments to ensure better recovery through maturity harvesting. In general, December plantations and ratoon crops are perceived by farmers as unfavourable as far as harvest scheduling is concerned. Hence, the rampant intentional burning of cane by members to jump the queue as we alluded to earlier. The factories have devised increasingly stricter penalties to minimise deliberate burning of sugar-cane.

We sum up this section by pointing out that the tight regimen for acreage allocation linked to shareholding and harvest scheduling which sugar co-operatives of south Gujarat

are able to enforce on their members account for their high processing efficiency and high price paid to members for cane, this, in turn, makes cane cultivation for the sugar co-operative by far the most attractive option for members and encourages them to comply with the regimen with minor deviations (such as intentional burning of cane) which can be contained through penalties and administrative measures The powerful logistical support provided by co-operatives makes them even more attractive to their members The 'upward ratchet' that so results is one important element of their design which accounts for the success of the sugar co-operatives of south Gujarat

III
Board Elections

The second important element in their design is their political structure which gives the sugar co-operatives of south Gujarat and Maharashtra highly patronage cohesive governance Our evidence on this aspect too was a vindication of the point that Attwood and Baviskar (1987) have already made that, compared to dairy co operatives where managers and technocrats have a high profile, sugar co-operatives in Gujarat and Maharashtra have primacy of member control through their elected leaders Direct election of the co operative's board by members is the primary element of their design which ensures this We note that this unitary structure that sugar co-operatives adopted was not common in other co-operatives of the area For example, cotton co-operatives, even at taluka level had a federal structure, for example, the well known Purushottam Farmers' Co-operative had individual farmers, village cotton sale co-operatives as well as PACS as its members, all these constituted the electorate for its board Federal structure was a rule also in co-operative spinning mills, rice and pulse mills and some early vegetable co-operatives although Surat's taluka milk unions such as in Choryasi had a strange admixture of producer as well as consumer representation

The command area of the factory is typically divided into 12-15 zones of roughly equal membership (but in some co-operatives, of equal area under cane) Members from each zone are entitled to nominate candidates for election to the board of which one per zone will be elected In many co-operatives, the bye-laws strongly stress the value of consensus Thus, a candidate who is unanimously elected by his zone straight goes to the board, however, if there is a contest, then all members from all zones will vote for the election from each zone Normally, candidates form competing panels and campaign In dairy co-operatives 'panel contests' have often served to introduce party politics in the co-operative political process since panels are aligned and identified as either 'Janata Panel' or 'Congress Panel' Our assessment was that, much greater stress was laid by members as well as contesting panels on past or promised performance Most panels tended to be elected more for the credibility and promise of their chairmen than on other considerations Finally, in case of dairy co-operatives, who will be the chairman depends largely upon which panel dominates the board and whom does the elected panel trust with leadership In sugar co-operatives, which panel gets elected will depend primarily on who their chairman-designate is, members are seldom in doubt about who the chairman will be from contesting panels It is claimed that this system, even while ensuring representation from each zone, does not promote zonal loyalties

Attwood (1988) has suggested that such political rivalries, both within and across co-operatives in a particular area in Maharashtra, drives such elected leaderships to expand, innovate and diversify We fully concur with this as well as the observation by Attwood and Baviskar (1987) that, unlike in dairy co-operatives of Gujarat, sugar co-operative elections are intensely fought, often generating more interest than even assembly and Lok Sabha elections

We also felt that (a) sugar co-operative elections highlight patronage issues important to members more than in most other co-operatives, (b) the intensity with which they are fought suggests the high level of centrality these co-operatives enjoy in their members' lives and in their respective domains, (c) sugar co-operative governance—in terms of their *realpolitik*—has many more features of the presidential form of national governance, whereas dairy co-operative have many features of the parliamentary form of electoral democracy For one, sugar co-operatives have direct election of board member by primary members, dairy co-operative unions have indirect election by an 'electoral college' consisting of the chairmen/management committee members of village co-operatives; second, if a majority of the primary members prefer leader A over leader B, in sugar co-operatives, chances are very high that he will end up as the chairman along with a board consisting of members he can work with, in dairy co-operatives, this may seldom happen As a consequence, in sugar co operatives, credit for high performance and discredit for non-performance get directly attributed to the chairman whose chances of re-election will rise or decline depending upon how patronage cohesive a governance his board has given to the co-operative, in dairy co-operatives, this linkage between performance and re-election is considerably weaker A chairman and board who maintain the loyalty of a segment of village co-operative chairmen can insulate themselves from the primary membership In any case, pleasing a few hundred village co-operative chairmen is easier than retaining the good will of several thousand members All in all, thus we felt that the political structures and mechanisms that have come to stay in sugar co-operatives in Gujarat and Maharashtra appeared to us capable of more patronage cohesive governance than those we see in federal co-operatives

But we differ with them crucially on interpretation of the operational implication—we consider both these—the structuring of the cane supply relationship as well as of the political mechanisms—to be aspects of the design-concept of sugar co-operatives We believe that members, leaders and managers of new co-operatives intuitively understand the value of these design features and therefore adopt them *in toto* or with minor modifications The fact that all sugar co-operatives in south Gujarat and Maharashtra have found it useful to retain these features in their design suggests their robustness Finally, we believe that if cane supply unions, or sugar co-operatives elsewhere or even private sugar factories adapt some of these design features, they too will be able to improve their performance which will then be limited only by the resource endowments of their domains [2]

TABLE. PRICE FORMATION IN SUGAR CO-OPERATIVE SHARES

Sugar Co-operative	Market Value of Share (Rs)	Ropan Per Share (acres)	Market Value/ Acre of Ropan (Rs)	Cane Price Paid (Net of Harvest and Transfers) (Rs/mt)
1 Bardoli	110 000-125,000	10-12	10,000 11,000	530
2 Chalthan	25,000	1 5	16,666	545
3 Sayan	32,000	2 25	14,200	511
4 Madhi	18,000-20,000	1 25	14,400-16,000	490
5 Maroli	8,000	0 63	12 700	486
6 Gandevi	32,000	4 00	8,000	515
7 Valsad	6,000	1 00	6,000	485
8 Mahua	8,000-10,000	1 00	8 000-10 000	455
9 Vyara	transfer not allowed	0 75	—	495
10 Ganesh	4,000-6,000	1 50	2,650-4,000	390

IV
Markets in Sugar Co-operative Shares

In its actual operation, besides the formal political mechanisms, member control over governance and management of sugar co-operatives is considerably aided by the existence of the interesting and ingenious market for sugar co-operative shares—an institution whose significance has been completely ignored by social researchers so far

Shares with a face value of Rs 500 are initially issued to agriculturalists within the design command of the factory Farmers may apply and get as many shares as they wish, however, a member is entitled to only one vote unless shares are registered in names of various members of a joint family In this latter case a family would control vote blocks as large as 20 30 in the extreme but five six votes per family are not at all uncommon This the official share registers of the co operatives do not reveal The tight linkage between the amount of cane a member can supply and the number of shares he owns or is able to mobilise coupled with the following three conditions has set the stage for the rise of a highly informal but differentiated markets in the shares of these co-operatives

(1) the profitability of cane supplies to the co-operatives (at 1990 prices of Rs 470-480/mt) has, over the past two decades remained consistently, predictably and substantially higher than either growing cane and for private khandsari units (@ Rs 230 250/mt in 1991) or kolhus manufacturing gur (@ Rs 50 150/mt in 1991) or growing other crops such as paddy or cotton With the rise of canal irrigation, sugar co-operatives have become the most powerful economic machines to transform the abundant water resources into wealth and economic prosperity for their members As a consequence there has been rapid and continuing shift in the cropping pattern of the area in favour of cane, and the pace of this change has been checked only by the limited crushing capacities of existing co operatives resulting in excess demand for ropan area

(2) Membership of sugar co-operatives is in letter as well as spirit, 'closed' The Bardoli factory for example has never issued shares to agriculturists other than its original members over the last 35 years Chalthan co operative enrolled some new members a few years ago when it expanded its capacity However, by and large, original members have strongly resisted open membership The only way for late comers to acquire membership is by purchasing shares from an existing member at their prevailing market price The co-operatives register such transfers under certain conditions and only if the buyer is a bona fide agriculturalist within the co operative's command

(3) The government has restricted the total crushing capacity in the state by its licensing policy It is clear that existing co-operatives would support the present policy which reinforces their members' allegiance to them by minimising competition Absence of any of these factors would eliminate or seriously modify these active informal markets There are basically three categories of transactions

(a) outright sale of a share which transfers the permanent right to supply cane every year Chalthan's Board, for example processes 60 70 applications for share transfers in each of their two-monthly meetings

(b) the sale of a particular season's ropan and the allowed ratoon against which the co-operative is obliged to harvest

(c) within a season exchange of ropan of different months

Outright sale is formally recognised by the co operatives and registered in their books but without formally taking cognisance of the premium paid The markets are conditioned by policies each co operative pursues All co operatives permit outright sale only within their areas of operation Many co operatives—such as Bardoli—stipulate that the share can travel only towards the factory so as to reduce the cost of transportation field supervision and extension support, this policy also ensures better control over cane supplies Such outright sales of shares occur at startlingly high prices The Bardoli share, the oldest one, with a face value of Rs 500 commanded in 1991 a market price of Rs 100-1 25 000 the Chalthan share commanded Rs 20-28 000 Sayan share sold at Rs 55-60,000 and that of Maroli Rs 5-8,000 There were considerable variations in the exact terms of transactions Much of this variation was explained by the absence of arbitrage

For example a share transfer accompanied by current ropan commanded a premium of Rs 3 5 000 in Chalthan Similarly if the seller transferred his deposit with the co operative the buyer expected a discount of Rs 1 000 or so The next two types of transactions we came across were even more elusive We could guess the extent of ropan transfers against payment Many farmers suggested a crude exchange system, when a farmer has more ropan than needed he permits friends/relatives to use his ropan free of charge but hoping for reciproca tion in future We heard people quoting Rs 1,000-4,000 per share of ropan of Chalthan October ropan of course commanded the highest price of Rs 3-4,000, followed by November at Rs 2-3,000 and December at around Rs 1,000 Here too, the policies of the co-operative affected the depth of the market as well as terms Bardoli formally prohibits such transfers of ropan, thus a buyer has to supply cane in the seller's name In this case, all compulsory deductions from cane price get credited to the seller's account Chalthan recently permitted formal transfer of ropan giving a fillip to the ropan market Chalthan had fairly large transfers of ropan during the last three years, this has resulted in the rapid increase in the ratio of actual area planted to ropan allotment, from 75 per cent to 90 per cent

Price Formation

These astoundingly high share prices basically reflect the high profitability of cane cultivation for sugar production relative to gur/khandsari production or growing other crops Informal discussions indicated that net income/acre of cane in late 1980s was around Rs 20,000 over a two-year period including the plantation crop and the first ratoon The other major crops in the area—paddy banana vegetables etc—are considerably less profitable In many parts of Sayan and Olpad talukas farmers prefar to grow cane for khandsari' units or even kolhus' rather than grow other crops

Price risks in vegetables and banana have tended to be high, for example, during the first half of 1991, banana prices fluctuated between Rs 0 50 and 1 50/kg In contrast, price risk is negligible for cane supplied to co operatives with consistently good performance Thus as an investment a co operative s share makes good economic sense for a farmer The Chalthan share with a market value of Rs 25,000 and current ropan of 1 5 acres guarantees a net incremental income of Rs 8-10,000/year to the buyer At a discount rate of 22 per cent-25 per cent and despite the uncertainty about the future of cane in the area, the prevailing share price adequately reflects its investment value The market is localised and additional capital is needed given the investment in land

More intriguing are the variations in share prices across co-ops The primary determinant of these is of course the ropan per share Thus most farmers explained that the Bardoli share sells at a much higher price of Rs 1,10,000 than Chalthan's Rs 25,000 because Bardoli s ropan per share is 10-11 acres compared to 1 5 acres (after expansion) in Chalthan But we found it intriguing that Sayan with a ropan of 2 25 acres sold at Rs 55-60,000 in 1991 more than twice the price of the Chalthan, more importantly, by 1992 Sayan's share had tumbled to Rs 32,000 Contrary to the local belief, we thought Bardoli was somewhat underpriced, it offered seven times Chalthan's ropan but commanded only four times the Chalthan price

We formulated a number of simple price-theoretic hypotheses to explain price differentials amongst shares of different sugar

co-operatives in south Gujarat. For example, Bardoli is underpriced (in terms of share price per acre of ropan) because (a) of its insistence that shares can 'travel' only towards the factory which reduces their effective demand, (b) only large farmers with 9-10 acres of ropan requirement can make effective use of the share, especially, in the light of (c) their policy of not allowing ropan transfers We inferred therefore that the Bardoli share would rise if they were to allow (a) transfer of shares anywhere within their command, and (b) formal sale of ropan Chalthan did both these in the last few years, and its share prices rose Finally, we also inferred that if Bardoli were to split its share into say seven or eight shares each with a ropan of around 1 2 acre, its price would not fall to Rs 15,000 but would settle at Rs 20,000-22,000/share This is because many small landholders would then find it easier to make effective use of the share, the total market for the Bardoli share would thus expand

Likewise, until 1991, the Sayan share sold at twice the price of Chalthan share because (a) most of Sayan s command had no overlap with any other factory so that the Sayan farmers were excessively dependent upon Sayan factory unlike Chalthan, (b) landholdings in Sayan are larger than in other talukas The total gross cropped area in its command too is large There is a good deal of unregistered cane grown for kolhus and khandsari units compared to which the Sayan factory offers a much better deal Since the phenomenon of burnt cane is a direct result of the mismatch of the harvesting schedules as desired by the factory *vis a vis* the schedule suiting the cropping patterns of member farmers, the higher the proportion of burnt cane arriving at a factory, the lower will be the market price

Above all, share price per ropan acre strongly depends upon the expectations members and other farmers have about the factors which have a bearing with overall performance of the factory, and its impact on the economics of sugarcane farmers In the Sayan area, for past several years, some disputes with government of Gujarat were holding up the commissioning of a new factory at Kamrej Between July 1991 and July 1992, these disputes were resolved The erection work for the Kamrej factory was begun in right earnest No sooner had this happened, than the Sayan share tumbled from Rs 55,000 to Rs 32,000 Since both the factories have large overlaps in their command, members who had invested in Kamrej shares were willing to divest some of their Sayan shares in the mere expectation of the commissioning of Kamrej

Similarly, member expectations about long-term ability to pay higher or lower cane price than at present affects share price If with capacity expansion from 7,500 to 10,000 mt/day, Bardoli is able to assure early end to crushing season, chances are high that its share will rise We also hypothesise that any concrete plans for expansion of capacity or anticipated potentials will result in expectations of higher ropan per share in future and hence a higher current share price premium per acre of ropan Co-operatives which consistently pay a slightly higher cane price will certainly command a higher premium, however, there are also minor differences in input subsidies, compulsory deposits per mt, interest on deposits, etc, across co-operatives which also may account for some of the share price differentials

In the long run, share prices of sugar co-operatives will get strongly affected by factors which may have little to do with their actual performance Thus if the incidence of wilt and other diseases increases in the Bardoli area, it may hit at the root of its sugar economy, and Bardoli's share may tumble notwithstanding its performance Similarly, if the current wave of delicensing encourages rapid growth of sugar factories in the co operative as well as private sectors it will at once expand the area under sugar-cane and reduce share prices of existing co operatives In the immediate run, however, share prices of co operative factories normalised for their ropan allocations reflect the sum total of following factors (a) the incremental productive value per acre of land created by sugar cultivation for the factory compared to the better of the two alternative uses of land namely, sugar cultivation for kolhus/ khandsari units or cultivation of alternative crops, (b) the extent of overlapping of command areas of different sugar co operatives, (c) policies followed by sugar factories which determine the norms and terms for transactions in share and ropan allocations, and (d) the expectations members and others have about how (a), (b) and (c) are likely to change in future

VI
Impacts of Informal Share Markets

Informal share markets of sugar co operatives produce in them dynamics which are different from other co-operatives In most co-operatives, a share is only a notional endorsement of one's membership and an entitlement to a single vote In a sugar co operative, however, a share signifies, in its true sense, the share in the joint productive capacity of the co-operative factory and the farmlands of its members, and a claim, in perpetuity, to a significant flow of incremental return Thus the price of a sugar co-operative's share has great significance for its owner as

Wealth a conduit of value It is fairly liquid since it can be sold and/or transferred easily, a good hedge against inflation People often sell a share to tide over a contingency and buy it back later

Index of Performance Although actua[l] transactions in the market are not as many as in corporate stocks, there was scarcely a farmer we met who did not mention the share price to highlight how well the co-operatives were doing

Instrument of Control By establishing a functional consensus around share price as a robust and sensitive summary index of management performance, the operation of these informal markets heighten the board's and managers' sense of accountability to members and their patronage interests

The most powerful obstacle to effective member control in co-operative organisations is the absence of a summary index of management performance about which information is available widely More, such information as is formally made available—through, for example, accounting statements—does not facilitate the emergence of functional consensus around an overarching performance index It is, for example, very difficult for the members of a dairy union to tell whether their co-operative is performing better compared to what it did five years ago or compared to the neighbouring co operative or compared to its performance potential Price paid for milk is often a very limited indicator, and if it gets widely used as a summary indicator of overall performance the co-operative's board and managers will easily raise milk price by curtailing technical and logistical support members find useful If a sugar co-operative tried such a strategy we believe the members will see through it and the resultant adjustments in the market price of its share will reflect members' feelings about it. If members in general think it a better arrangement to cut out subsidies on technical and logistical support and pay higher cane price, the price of the co operative's share will rise, but if members place high value on economies from centralised spraying of pesticides centralised harvesting and transport, etc then the new strategy will reduce the price of the co operative's share

An important reason why investor owned businesses strive to perform well is that through the institution of stock market, even lay investors can continuously judge and compare the performance of companies by comparing the market value of the share And the fact that investors do so puts pressure on company management to do things which raise market value of share In case of sugar co-operatives too the share price in t[he] informal market is a useful—if imperfect—index of performance It provides members continuous 'information' about the overall performance of the co-operative under a giv[en] leadership and the fact that leaders an[d] managers know that they are judged on t[he] basis of this price, they are under pres[sure] to ensure that it does not fall except f[...]

reasons they can easily explain and justify

The other major reason why sugar co-operative members expect and secure greater accountability from leaders and managers is members' high economic stake in the co-operative. Sumul dairy co-operative union, which operates in the same region, for example, pumps in roughly Rs 75 crore/year in milk payments, but over a diffused membership of 1.5 lakh families, thus, to an average Sumul member, the dairy co-operative signifies an annual cash flow of Rs 5,000. In contrast, the Chalthan sugar factory pumps Rs 45 crore in its 182 villages, but among less than 10,000 families at an average of Rs 45,000/family. If we go beyond averages and probe further, we would find even greater concentration of surplus from sugar co-operatives in small pockets of their command. In Sayan factory, for example, 30 per cent-40 per cent of shareholding and cane supply are concentrated in five villages around Kudset near Kim. In Bardoli co-operative's compact command in a 10 mile radius, total membership of 5,300 is spread over 144 villages, but five hundred shares are concentrated in a block of 10 villages. This concentration of economic stake contributes to the extraordinarily large profile that the sugar co operatives enjoy in the economies of a segment of their members. These together with the direct election of the factory's board of directors (BOD) by primary members may explain why over 70 per cent of sugar co-operatives' members participate in the BOD elections while elections in dairy co-operatives are relatively tame affairs. It is easy to find faults with such skewed concentration of shares within the membership as well as among villages; however, it is also important to note that this concentration and inequality are at the root of the high performance and drive that sugar co-operatives exhibit.

VII
Market Value of Producers' Co-operative

In many respects, sugar co operatives behave like member owned corporations than as classical co operatives. They exhibit a drive towards efficiency and value addition that we seldom see, for example, in co-operative banks or state marketing federations. The share price as a central performance index is typical of corporations. The one-man one-vote rule, the main feature of co-operative democracy too has been diluted somewhat by families commanding multiple voting rights and groups of families often linked by kinship ties using these vote blocks to exercise decisive influence on the elections of the board.

However, there are two crucial differences: first, the logic of sugar co-operative's

operation ensures the prevention of absentee-control, the hallmark of the modern corporation where the shareholder-owner neither has nor cares to have any linkage with the business other than through the value of the share. This makes investor-owned corporations behave somewhat like absentee landlords. Sugar co-operatives use shares as an instrument to tightly link processing capacity and cane cultivation and supply by members. They can never afford to allow their shares being transferred to non-cultivators. Even while turning a blind eye towards some aspects of share transfers, each co-operative ensures that the transferee is an agriculturist within its command area. Thus although sugar co-operatives violate the one-member-one-vote and open membership norms of co-operatives, they are essentially self-governed organisations of members.

Secondly, and even more crucially, the market value of the sugar co-operative share does not reflect the 'net worth' of the sugar co-operative firm in the corporate sense; it rather reflects the capacity of the co-operative to maximise the return on cane cultivation for members. When a farmer buys a Chalthan share, he is not merely buying a share in the ownership of Chalthan's factory or in the market value of its net assets; he is buying the right to the excess of a stream of income that he can generate in collaboration with the co-operative over what he can without being a member of the sugar co-operative.

While there are some systematic factors internal to each co-operative which explain some of these price differentials, we observed that there are significant external factors, as well as future expectations that affect these differentials. The existence of such premia reinforces the members' stakes in the co-operative; in fact members' deposits, of various kinds, in the co-operative are many times their paid-up share value. In Chalthan, for example, members' deposits amounted to Rs 33 crore compared to the equity capital of only Rs one crore (as of September 1990). Thus the co-operative has virtually become a banking institution also.

What would happen to the market value of the co-operative shares if the government were to delicense sugar industry as seems very likely? Many new co-operatives would come up with possibly large overlapping areas of operation. In the immediate future, prices of existing shares would tumble; however, as long as co-operatives pursue closed membership and tight linkage between shareholding and cane supply, informal markets for shares would continue to exist or even thrive. However monopoly premia present in today's share prices would disappear; and share price differences would reflect more accurately performance variations among co-operatives. Those with superior track record of recovery, more efficient transport and processing, superior marketing and better service to their members will command higher premia; and sugar co-operatives in general would emerge as more powerful vehicles of socio-economic change.

In the long run, delicensing would create in south Gujarat a situation comparable to what we find in south Maharashtra today. With a large number of co-operatives vying for cane, the tables will be turned on the managements of co-operatives which will lose the monopoly power which obliges their members to accept the tight regimen of supply linkage and harvest scheduling. Instead, co-operatives will compete with each other for member as well as non-member cane. Member loyalty will decline. Poaching on others' territories will become rampant; and non-member cane procured at substantially lower price will be the main source of surpluses to placate members. With its larger irrigation potential, south Gujarat co-operatives will for a long time avoid facing an acute problem of capacity underutilisation; however, the present neat command areas will disappear.

What would happen if delicensing pits sugar co-operatives against private sugar mills? Our assessment is that provided private mills are not able to extract undue advantage—for example, by evading the levy or taxes, which is often their main source of competitive advantage in many other sectors such as edible oils—sugar co-operatives designed as they are in Maharashtra and south Gujarat will give them a good run for their money. We conclude thus because the three key design features we discussed in this paper which explain the success of sugar co-operatives in this area are inconsistent with the structure of property rights which investors seek in forming a company. For instance, a private company would try to minimise the cost of cane at factory gates, as a result, it will have no incentive to build long-term relationships with a well-defined group of cane growers who therefore will not agree to subject themselves to the kind of regimen which ensures high processing efficiency of sugar co-operatives. More private mills are unlikely to make or support the kind of investments sugar co-operatives make in irrigation schemes in Maharashtra. In case of co-operatives, assignment of surpluses for such investments are consistent with priorities of owner-members; but in the case of private factories, it is not. This is perhaps why private sugar mills in Maharashtra and Tamil Nadu have not been able to as well as sugar co-operatives. Finally, if the development of sugar sector and of farmers involved in sugar cultivation is an important goal of public policy, then our analysis provides strong basis for reserving sugar sector for co-operatives but for increasing the competition amongst sugar co-operatives.

Notes

1 By 'patronage cohesiveness' we mean the characteristic of governance which encourages a co-operative's board of directors to cohese around patronage issues and to use patronage interests of members as the only and central talisman for deciding on any issue. Policies, practices and decisions which encourage greater member patronage are referred to as 'patronage cohesive'; those which do the opposite, as 'patronage uncohesive' [see, Shah 1992].

2 In a recent work, Baviskar and Attwood (1992) have quite misunderstood this contention (made earlier in Shah 1992) by confusing the term 'design-concept' of a co-operative with the layout and physical design of a co-operative's sugar factory. As would be clear from this discussion, 'design-concept' has nothing to do with the physical layout of a plant or even with the organisation structure. It refers to the pre-formation vision of what will an organisation do, why, how and for whom. The cane supply relationship and design of the political structure we discussed here are, in our view, unique features of the design concept of a sugar co-operative. For a group of farmers contemplating a new sugar co-operative, they offer a set of guiding principles they can use to decide how they will organise, what will be the relationship between members and the co-operative, who will be the members of the co-operative, how will the professionals who run the co-operative be governed by members, and so on.

Analysis of Short-Run Price Instability of Cotton Hank Yarn

Murali Patibandla
H K Amar Nath

This article shows that the lower counts cotton hank yarn, which are used to produce lower quality segment of handloom cloth, are subject to higher short-run price instability than the higher counts hank yarn which are used to produce higher quality handloom cloth. We argue that one of the dominant reasons for the higher price instability of lower counts hank yarn is that the spinning mill sector treats the production of these counts as a residual activity. This, in turn, leads to erratic supply adjustment and high price instability.

THE main victim of the growth of the powerloom sector is the segment of the handloom sector which produces lower quality cotton cloth like the janata cloth, bed sheets and coarse cloth, etc.[1] From the demand side, this part of the handloom sector faces severe price and quality competition from the powerlooms. On the supply side, one of the very severe problems this part of the handloom sector faces are constraints in the availability, upward price rise and very high short-run price instability of lower counts hank yarn, which are used to produce the lower quality handloom cloth. This problem is severe especially in those states where the public distribution system of hank yarn to the handloom sector is weak.[2]

Hank yarn is produced in different counts which range from 10s, 20s, 30s to 80s and above.[3] These different counts of hank yarn are used to produce different types and quality of cotton handloom cloth. The lower counts of yarn, below 40s, are used to produce lower quality handloom cotton cloth while the higher counts are used to produce higher quality segment of the handloom cloth.[4]

It is generally observed that the prices of cotton yarn are subject to very high fluctuations at short-time period intervals. From the supply side, the cotton prices are blamed (by the spinning mills) for the short-run price rise and fluctuations. On the demand side, the seasonality in the demand for cloth is generally observed to be one of the determinants of short-run price instability.

In this article, we show that the lower counts hank yarn, which go into production of the lower quality handloom cloth, are subject to higher price instability than the higher counts yarn. Secondly, we argue that in the very short-run, the cotton prices should not play a dominant role in the price movements of cotton yarn. Furthermore, the seasonality factor in demand for cloth, should not cause short-run price instability of yarn, because the seasonal demand for cloth exhibits a systematic and highly predictable pattern which should facilitate smooth supply adjustment.

One of the major determinants of higher price instability at lower counts of hank yarn could be the production adjustment behaviour of the spinning mills. If the relative profitability of production of lower counts is lower, the spinning mills might treat the production of lower counts as a residual or by-product activity. This, in turn, makes the supply of this yarn to come into the market erratically but not according to the demand conditions which leads to high price instability.[4]

I
Short-Run Price Instability of Cotton Hank Yarn

The cotton yarn prices are generally observed to be subject to steep changes on weekly and also on daily basis.[5] Table 1 shows the maximum and minimum values of hank yarn prices within different months for 1991. These prices are based on the averages of the Coimbatore, Madurai and Vellore markets. Columns 1 and 2 of Table 1 show the maximum and minimum values (of prices within months) and column 3 show the difference between the maximum and minimum values. From column 3, it is obvious that the yarn prices are subject to steep fluctuations on very short-run basis.

The analysis of the price instability on the basis of weekly or fortnightly data is not possible due to the limitations of the available time series data of prices and other relevant variables. Due to this, the analysis is based on monthly data.

Data

The monthly data is collected from various sources: (1) *Monthly Abstract of Statistics*, CSO, (2) *Handbook of Statistics*, Indian Cotton Mills Federation (1991), (3) AFCOSPIN annual, (4) IMF Financial Statistics, and (5) Handloom directorates, etc. The monthly data for cotton yarn production includes both hank and cone cotton yarn for various counts. For stocks of cotton yarn, the data is available only with respect to the stocks of the spinning mills. For demand equation, since the monthly income data is not available, the monthly industrial production indices are used as proxy income variable.

Estimation of Price Instability

The index of price instability is taken to be the extent of the deviations of actual price observations around the estimated time trend. The time trend equation is as follows:

$$\log Py = a + b\,(t) + u \qquad \ldots(1)$$

Py = price of hank yarn.[6]
t = time variable (months)

The estimated residuals of the time trend equation are used in measuring the extent of price instability.
The instability index;

$$IN = \sqrt{\Sigma_i u^2 / N}$$

N = number of observations.

The index is estimated for different counts of yarn for the period of January 1985 to September 1989 (N=57). All the estimated trend equations are statistically significant (see Appendix I). Table 2 shows the estimated price instability indices.

From Table 2 it can be observed that price instability (IN) is falling as we move up on the counts. The instability is the highest at the hank yarn counts of 10s and it is the lowest for the counts of above 80s. In the following, we attempt to trace out the possible dominant factors causing higher price instability at lower counts, with major emphasis on the supply side.

II
Demand Side

Seasonality of Demand

As mentioned earlier, the demand for cotton yarn is derived demand from the cotton textiles consumption. Household demand for cotton textiles can be taken to be a function of household income and the textile prices (or relative prices).[7] In the very

short run the household incomes can be taken to be stable or constant. Although the incomes and the corresponding expenditure levels of the rural poor, like the agriculture labour and small land owners,* exhibit a seasonal trend, one can take even this income levels do not chnge significantly in the very short run.

But the seasonal changes in demand for cotton textiles can be said to be more for the lower quality segment of the cotton textiles, because the low income groups expenditure might exhibit more seasonal pattern than the expenditure of the higher income groups. But one can say that the seasonality in demand shows a systematic and highly predictable pattern. The demand is generally high during the festival (October) and marriage seasons (the summer months in the south and the winter months in the north India, which also generally coincide with the agricultural income). Since the short run seasonal changes in demand exhibit predictable pattern, the spinning mills should be able to plan their production levels correctly in accordance with the expected changes in demand for yarn. If the supply does not adjust smoothly to the short-run changes in demand, it leads to price instability. The supply side factors like the spinning mills production response mechanism and the prices and availability, of different varieties of cotton might be more dominant factor for the price instability, especially at the lower counts, than the demand side factors in the short run.

III

Supply Side

Cotton Factor

In the price formation of cotton yarn, cotton price plays a dominant role because 60 to 80 per cent of total cost of production is accounted by cotton. The importance of cotton prices may vary for different counts of cotton hank yarn due to differences in the cotton intensity and use of different varieties of cotton in the production of different counts. Table 3 shows the cotton component in the total cost of production of different counts. It can be observed from Table 3, the cotton cost component is the highest at the lower counts of hank yarn (20s) and it declines as we move up on the counts which shows that the cotton factor might be more dominant for the price formation of lower counts hank yarn. In the long-run price formation, the importance of cotton cost component is undeniable. But in the short run price formation or fluctuations, the cotton cost component may not be as dominant as in the long run. This could be true especially when the time intervals in the price movements of cotton yarn are very short. This is because cotton price will have an effect on the cotton yarn production costs (prices) with a minimum of one month to four months forward time lag due to time lags between the purchase of cotton and the production time period of cotton yarn by the spinning mills. Furthermore, some of the dominant spinning mills in Coimbatore (which are generally the price leaders in the cotton yarn market) buy the total annual or half yearly requirements of cotton in October (the harvest time) when the cotton prices are the lowest. The cotton cost for these mills will be the price of cotton at the purchase time plus the cost of stock holding (interest plus the storage cost). For these mills, the short-run movement in yarn prices cannot be attributed to the cotton price, as it remains more or less constant from one crop to the next crop of cotton.*

Different varieties of cotton are used to produce different counts of cotton yarn. Higher counts yarn require higher quality

cotton. As a result, the costs of stock holding, the relative prices and the availability of different varieties of cotton influence the relative profitability of different counts of yarn.[10] This determines the production decisions of spinning mills regarding different counts, which, in turn, determines the supply response to the changes in demand. Due to these reasons, if the relative profitability of lower counts hank yarn is lower, the supply response at the lower counts might be weaker. This could lead to higher price instability at lower counts, which will be discussed at a later stage.

Yarn Stocks and Supply Response

The stocks of cotton yarn held by the spinning mills or yarn traders could play a price stabilising role. The price stabilising role of stocks would be very significant when the production adjustment to demand changes is not smooth and if there are significant time lags involved in the production adjustment. If the stocks are released when the prices show a upward trend and are withheld in times of downward price trend, the prices should remain stable.

The stocks would be held if the expected rise in prices is higher than the cost of holding the stocks. The cost of holdi.ıg stocks is determined by the availability of working capital and the interest rate.[11] Secondly, the cost of holding stocks is also determined by the commodity characteristics like the volume (storage space) and the durability of the product.

It is observed that the spinning mills find the gains associated with holding the stocks of lower counts yarn are lower compared to the finer counts yarn.[12] If the stocks do not play significant role in supply response for the lower counts of yarn, it would be the production adjustment (or time lag) which determines the supply response to demand conditions. If the production response does not match the changes in demand conditions, it leads to price instability.

Production Adjustment and Supply Response

If the relative profitability of lower counts hank yarn is lower in comparison to the higher counts, the production of the lower counts could be treated as residual activity by the mills. In such a case the production levels of lower counts of yarn depends on the production levels of higher counts yarn, but not necessarily on the (expected) demand conditions for the lower counts. This aspect is illustrated as follows.

The production technology of any spinning mill could facilitate production of different counts of cotton yarn. If the relative profitability of higher counts is higher, the major part of production activity of the mills would be directed at the higher counts. When the demand for the higher counts of yarn goes down, instead of keeping the capacity idle, the mills would produce the lower counts. As a result, the production levels of lower counts yarn would be determined by the production (or demand) levels of higher counts yarn, but not by its' own demand conditions. Apart from this substitutability in production, there could be complementarity in production of different counts hank yarn. In such a case, some of the lower counts yarn might be treated as by-products of higher counts yarn in production.[14] In both the cases of substitutability and complementarity in production, the production levels of lower counts yarn would be determined mostly by the production levels of the higher counts but not according to their own demand conditions. Consequently, the supply of the lower counts comes into the market erratically but not on the basis of (expected) demand conditions. The erratic supply, in turn, could lead to higher price instability at lower counts hank yarn.

IV
Econometric Results

The econometric exercises are based on monthly data for three years—1987, 1988 and 1989. The supply equation is specified as follows:

$$\log Qi = a + b1\ \log(Py)i + b2\ \log(Pc)i + b3\ \log(S)i + i \qquad \text{... (2)}$$

$b1 > 0,\ b2 < 0,\ b3 < 0.$

The Notations of the Variables

Q = The production (includes Hank and Cone yarn); Pc = Cotton price; PH2 = Hank yarn price count 20s; PH4 = Hank yarn price count 40s; PH6 = Hank yarn price count 60s; PH8 = Hank yarn price count 80s; Pyc2 = Cone yarn price count 20s; Pyc4 = Cone yarn price count 40s; Pyc6 = Cone yarn price count 60s; Pyc8 = Cone yarn price count 80s

Q = quantity of cotton yarn supplied
Py = price of cotton yarn
Pc = price of cotton[15]
S = cotton yarn stocks.

As mentioned earlier the data available for the quantity of cotton yarn is not segregated into hank and cone. Due to this reason, we have used the cotton yarn (which includes both hank and cone yarn) for the quantity supplied and prices are for the hank yarn. Table 4 shows the results obtained for three different counts cotton yarn. The signs of the estimated coefficients conform with the expected signs. The sign of the estimated coefficient of the price variable is positive in all the cases. This suggests the specification of the supply equation is correct. To make sure the specification of the supply equation is reliable, we estimated the corresponding demand equation for the data set. The estimated sign of the coefficient of price variable is negative and significant in the demand equation, estimated. (The results of the demand equation are presented in the Appendix II.) These results obtained for the supply and the demand equations suggest that the above specification of the supply equation is reliable.[16]

The noticeable aspect of these results in Table 4 is that, although the sign of the estimated coefficient is positive in all cases, but it is statistically insignificant for the lower counts. This can be interpreted, in support of the argument presented earlier for supply response and production adjustment, that the supply (or production) of lower counts cotton yarn, may not be responding to its own price signals (or demand conditions), if its production is treated as a residual activity by the spinning mills.

The coefficient estimated for the cotton price variable is statistically significant and, as expected, is of negative sign. This suggests that higher the cotton price lower will be the (profitability and) production level of cotton yarn. But it has to be taken into notice that the value of the estimated coefficient (the elasticity) is far less than 'one' in all the cases.

The following production adjustment equation is derived from the supply equation specified above.

$$\log Q = a + b1 \log(Pc) + b2 \log(P1/P2) + i \quad ...(3)$$

$b1 < 0,\ b2 \neq 0.$

As before 'Q' is the quantity of cotton yarn supplied and 'Pc' is the cotton price variable. The cotton price variable is introduced into the equation to identify the equation to be the supply equation.

In the above production adjustment equation, the cotton yarn price variable is taken to be the relative prices (P1/P2) between the different counts of yarn. This is because, as argued in Section III C, the production levels of lower counts might depend on the demand (or price) and production levels of higher counts of yarn, if the lower counts production is treated as a residual activity. The relative price variable is taken to capture this behaviour.

The results obtained for the production adjustment equation (3) are presented in Table 5. The important aspect of the results is that the estimated coefficients of the relative cotton yarn price variables are statistically significant at the lower counts of cotton yarn, while they are generally insignificant for the higher counts cotton yarn. These results and the results obtained for the supply equation (2) suggest that the supply of lower counts of yarn responds more to the price levels or demand and production levels of higher counts yarn than to its own demand and price signals.

In case of the results obtained for the production equation for the cotton yarn counts of 11-20 (row 1 in Table 5), the sign of the estimated coefficient associated with the relative price of hank yarn counts 20s and 60s is positive and statistically significant. This result suggests that if the relative price of yarn counts 60s goes up the production of yarn counts 11-20 goes down. On the other hand, the negative sign of the coefficient associated with the relative prices of counts 20s and 80s suggest the complementarity (or by-product relation) in the production of these counts. Similar interpretations could be applied to the rest of the results on the basis of the signs of the estimated coefficients.

These results, in general, suggests that the production of lower counts yarn might be treated as a residual activity by the spinning

mills. This, in turn, leads to the supply of lower counts cotton hank yarn to come into the market erratically but not according to their own demand conditions. This could be one of the dominant reasons for higher price instability at lower counts cotton hank yarn.

V
Conclusion

The empirical results of this paper show that the lower counts hank yarn are subject to higher short-run price instability than the higher counts. One of the very dominant reasons for this could be that the spinning mills, generally, treat the production of the lower counts as a residual activity. The major part of the production activity of the spinning mills is generally concentrated at finer and higher counts, given their higher relative profitability. Spinning mills produce the lower counts hank yarn when the demand for the higher counts is low. Consequently, the supply of the lower counts yarn depends more on the demand for higher counts than its own demand conditions. This type of erratic supply response for the lower counts hank yarn could be the major reason for higher price instability at these counts of hank yarn.

Notes

[The authors are grateful to Mihir Rakshit and Pronob Sen for very useful comments.]

1 See Goswami (1990).
2 In the state of Tamil Nadu, where the state public distribution is very strong, the handloom weavers in the state does not face the problem of price rise and non-availability of required counts of hank yarn. In those states, where the weavers depend mostly on the cotton yarn private traders, the price rise and instability is a severe problem faced by the handloom weavers.
3 Hank yarn is used exclusively by the handloom sector. Cotton cone yarn is used mostly by the powerloom and the mill sector. Hank yarn has to be converted into cone form to be used by the powerlooms.
4 The lower counts face the derived demand (from the cloth consumption) from the lower income, mostly the rural segment, of the population. The higher quality segment of the handloom cloth, which uses the higher counts hank yarn, faces derived (income elastic) demand from higher income segment of the population. This sector do not face competition from the powerloom and the mill sector as it has its own market segment or niche.
5 One of the other reasons for the price instability could be the speculative activity by the wholesale yarn traders. But we ignore this aspect in the paper.
6 Some of the dominant spinning mills in Coimbatore publish the list of daily prices of cotton yarn.
7 The price observations are normalised by the
8 See Murthy (1983) and also Goswami (1985).
9 The major part of demand for the lower quality segment of handloom cloth comes from the rural poor.
10 For the small spinning mills which cannot hold cotton stocks, the movements in cotton prices within a harvest year, play an important role in determining the cost of production and the resultant profitable price levels.
11 For example the incidental costs and (cotton) wastage in the production of finer counts is observed to be lower in comparison to the coarse counts.
12 The stock equation can be derived from a two period profit function of a firm (the spinning mills). If the quantity of stocks, 'St', are sold at the base period 't1' at price 'P1' the profits of the amount is:
$K1 = P1St - c(St)$ ... (1)
c(St) is the cost of producing the quantity of stocks.
If we take the firm as a price taker, the profits are maximum when:
$P1 = c$, which implies;
$P1St = c(St)$ ... (2)
If the stocks are sold at the next period 't2' at the next periods (expected) price, 'P2', the profits associated with the stocks are,
$K2 = P2St - [c(St) + r(St)]$ ... (3)
where r(St) is the cost of holding the stocks.
By substituting (2) into (3) we get the net profits of holding stocks;
$(K2 - K1) = St\,(P2 - P1 - r)$ ... (5)
The stocks will be held if and only if
$St\,(P2 - P1 - r) > 0$ or
$(P2 - P1)/r > 1$.
13 The spinning mills are generally reluctant to hold on to the stocks of lower counts yarn. Some of the spinning mills reported that they are reluctant to produce lower counts hank yarn because of high costs of holding the stocks. If the buyers do not lift the output immediately, the mills incur the high costs of holding the stocks. We estimated an equation of stocks; taking stocks of cotton yarn as a function of lagged price variables and bank rate of interest. Interest rate is taken to reflect the costs of stock holding. The estimated parameter associated with interest rate came out to be very significant with (expected) negative sign, mainly in the case of lower counts yarn. This can be interpreted that higher the interest rate less important will be the role of stocks as price stabilisers.
14 The complementarity arises in the utilisation cotton wastage (in the production of higher counts) towards the production of lower counts yarn.
15 The causality between cotton yarn price and cotton price could be other way round because the cotton price is determined by the supply and demand for cotton and demand for cotton comes from the production of cotton yarn. Since cotton is an agricultural output, we assume that the cotton prices are mostly supply determined in the short run in order to justify our specification of the supply equation.
16 Similar equations are estimated for cotton cone yarn also, the results are quite similar.

The Blotted Copybook

S Guhan

My Presidential Years by R Venkataraman; Harper Collins Publishers India, New Delhi, 1994; pp xii + 671, Rs 395.

I

R VENKATARAMAN's 654 page account of his five years (1987-92) as India's eighth president makes heavy demands on the reader's time, patience and stamina. Its length alone is not a major deterrent for the discriminating reader can quickly traverse large parts of the book devoted to the author's numerous foreign and internal tours; his non-substantive discussions with foreign and domestic dignitaries; the grandeur of Rashtrapathi Bhawan's halls, gardens and artefacts; investitures, banquets and functions; and the outpourings of official wisdom on occasions such as the opening of parliament sessions, governors' conferences, R-days and I-days. RV himself has the consideration to say, in the prologue, that excerpts from his speeches on various occasions "may make tiresome reading and may be skipped without much loss". This helpful advice applies to much else in the book.

As far as the substantive parts of the book are concerned, it is the structure not the length that is the real problem. While these occupy no more than about a third of the volume, the treatment is so relentlessly chronological that references to the same or related issues are widely dispersed. It is as if pieces of different jig-saw pictures are buried helter-skelter in a mass of sawdust. Painstaking effort is required to pick out and piece them together to arrive at any kind of a meaningful construct. Nor is this all for many pieces of the jig-saw are also chipped or are missing. All autobiographical accounts of Eminents are self-serving and RV's is no exception. Like all of them, he indulges in *suppressio veri* and *suggestio falsi*. Very often he fails to explain his motivations or decisions; nor does he bother to adequately take note of, or respond to, criticisms to which his actions were exposed from time to time during his tenure. The reader, therefore, has to reconstruct the events described with the use of what is stated, what is circumstantial, and what can be read between and behind the lines eking these out with independent knowledge of events, personalities and issues. Fortunately, the period covered is a recent one and there are enough chinks in the armour of the narrative to make this possible; for a careful reader, the cats keep coming out of the bag.

In approaching the book, it is necessary never to forget that the political filling and the presidential crust of RV are inseparable. Prior to becoming president, RV had had a long and varied political past. Starting life as a trade union leader, he was a member of the very first Lok Sabha (1950), minister for industries for 10 years in the Congress government in Tamil Nadu (1957-67), member of the Planning Commission, a critic of the Emergency who switched over as an Indira loyalist, member of parliament from south Madras elected with the support of the AIADMK in 1977 and that of the DMK in 1980, defence minister, finance minister and vice-president. In this long journey, it is natural that RV, the politician, should have accumulated numerous debts to discharge, loyalties to be proven, and scores to be settled. It is unrealistic, therefore, to expect that he would have been able to change his political stripes and transform himself into a strictly non-partisan, constitutional president on his elevation to that office in 1987 at age 77. As this review will amply show RV, the president himself did not want to be anything other than RV the Congress politician although his assiduous attempt is to project the image of a head of state as close as possible to the British monarch. He does not quite succeed in bringing this off: again and again, the Gandhi cap keeps tumbling out of the Queen's tiara.

RV was very much the right man in the right place at the right time when the Congress Party nominated him for the presidency in mid-1987. While his antecedents went back to the Nehruvian era, he had had time and opportunity to establish loyalty not only to Indira Gandhi but also to Rajiv. In government, his reputation was that of a sound administrator. In parliament, he had ably handled the Rajya Sabha as its vice-chairman cultivating good personal relations with leaders of all political parties in the process. In the Congress, he was an elder and one of the few left with a reputation for sobriety and dignity. His training as a lawyer, command of English and affable manners were other assets. With all this, it was natural for RV to play a number of roles while purporting to be no more than the symbol of the State. He was the Grey Eminence to the Congress Party; a readily available source for administrative advice; a mentor to Rajiv regardless of whether Rajiv was prime minister (1987-89), opposition leader (1990), or proxy prime minister to Chandra Sekhar (1990-91); a port of call and a sounding board to politicians of all hues; a communication link between the government and the opposition at each turn of the screw during 1987-92; and a president who could claim to be the helmsman when the ship of state was tossed in the tempestuous waves of constitutional crises.

There is rich evidence in the book of RV playing all these diverse roles with gusto. His advice extended to all the outstanding domestic and international issues of the period: Punjab, Kashmir, Assam, the Mandal agitation, Sri Lanka and relations with China. On high appointments, he has advised on the selection of governors and judges; he opposed the appointment of Jag Mohan to the Rajya Sabha; it was on his suggestion that Manmohan Singh was chosen as finance minister by Narasimha Rao. He advised the finance secretary and the banking secretary on financial administration, the Reserve Bank governor on managing the balance of payments and sent formal notes on containing inflation and on the reform of direct taxes. Even the speaker of the Lok Sabha and the chief election commissioner were not in immune from his advice. He mediated between prime minister Narasimha Rao and finance minister Manmohan Singh in persuading the latter to withdraw his threatened resignation on the fertiliser subsidy issue. After calling on him with 'glistening eyes' Manmohan went back consoled by RV's advice that 'politics rests on innocuous compromises'. Other pieces of advice have extended to how border disputes should be settled and why Sanskrit should not be deleted as an optional subject in CBSE examinations. The range is very wide indeed attesting to how often RV's advice was sought and/or how freely it was forthcoming.

RV did not, by any means, confine himself to giving advice on the country's political and administrative issues. On these, his experience was an asset and his *locus standi* can be conceded. He also kept open house in Rashtrapati Bhawan for politicians within and outside the Congress. He conveyed Arun Nehru's desire for reconciliation with Rajiv through Fotedar and later listened to Arun Nehru's grumblings against V P Singh. Dinesh Singh was another who sought his help in patching up with Rajiv. He advised Madhava Rao Scindia on how to deal with allegations. He listened to Bhajan Lal's complaints of harassment by Devi Lal when the latter was the Haryana chief minister. Harideo Joshi sought his help for continuing as chief minister of Rajasthan. Even while out of power, Rajiv shared with RV his desire to get rid of Veerendra Patil in Karnataka. The president discussed the state of the Congress Party with fellow veterans like Kamalapati Tripathi, Uma Shankar Dikshit and Sanjeeva Reddy. He endorsed Vazhappadi

Ramamurthi's resignation from the cabinet on the Cauvery issue so that "the reputation of the Congress in Tamil Nadu as the champion of its rights" could be maintained but advised Rangarajan Kumaramangalam — to whom RV admits to being "friend, philosopher and guide" —against following suit since "a token protest by Ramamurthi was enough". Through Karunakaran he advised Rajiv on what the Congress stand should be in staking claim to office in 1989. Later he not only advised Karunakaran on how the Congress should elect the successor president to Rajiv but also conveyed that Narasimha Rao was the most appropriate choice. Later still, his ear was available to disappointed office-seekers in Narasimha Rao's own cabinet.

The most glaring instance of RV's continuous involvement in Congress politics during his presidential tenure is contained in the detailed advice he gave to Rajesh Pilot who sought his counsel on how to strengthen the Congress organisation. "I told him," says RV, "that interaction between the party and the government should be strengthened, that the Working Committee must meet every month and thrash out national issues, that the AICC should meet once every six months and hear non-official views instead of delivering sermons to them, and that the general session of the Congress should be held once a year as was done in pre-Independence days." This is indeed a far cry from the concept of the president as a constitutional monarch. Can you imagine Buckingham Palace advising the Conservative or the Labour Party on how its annual conference in Brighton or Blackpool must be run?

RV's narrative also makes it clear that throughout he believed in furthering Rajiv's best interests. As vice president and chairman of the Rajya Sabha he had saved Rajiv from a major crisis by disallowing the discussion of the president's right to information under Art 78 of the Constitution. During the last few months of Zail Singh's presidency Rajiv was gravely threatened. The Bofors issue had blown up and, as RV himself discloses, there was a real possibility of substantial defection in the Congress Party and talk of Zail Singh planning to dismiss Rajiv. In these circumstances the overriding concern for the Congress was to have as president one who could be depended upon to shield and support Rajiv. RV, in addition to his other credentials, perfectly filled the bill. His terms of reference, as far as the Congress was concerned, was "to preserve, protect and defend Rajiv Gandhi". This was in fact made explicit while offering the post to him. Kamalapati Tripathi said "I hope you will not dismiss the prime minister" and, after RV's election, Narasimha Rao followed up with "we have taken all this trouble to ensure that we are trouble-free for the next five years".

RV thus was, at the same time, Rajiv's client and his patron. It is worth dwelling a little bit on the tensions and contradictions of this complex relationship. As client, in true Tamil Nadu style, RV draped Rajiv "with a traditional silk zari '*ponnadai*' which made him (Rajiv) look rather grand". The president broke protocol, overruling the objections of his staff, to receive Rajiv on his return from Colombo after signing the accord with Sri Lanka in order to express concern about the attack made on him. Rajiv himself was surprised for he had not received any injury having successfully ducked the naval rating's attempt to bludgeon him. However on RV's part it was important to demonstrate fealty as much as concern. As mentor, RV advised Rajiv on many occasions and on many issues not only when Rajiv was prime minister but even after he became the leader of the opposition. He advised him on how to handle parliament on the Bofors issue and in the case of the Thakkar Commission report. Later he advised him about tabling the CAG report on Bofors and when best to go for parliamentary elections in 1989. He refused sanction to Shanti Bhushan to prosecute Rajiv. When Rajiv moved into the opposition RV held his hand with advice on what positions the Congress should take on Jammu and Kashmir, the Punjab elections, the confidence motion on V P Singh and on giving support to the Chandra Shekhar government.

With all this, it is also clear that RV had a poor opinion of Rajiv as a parliamentarian, administrator and politician. He refers to the 20 reshuffles that Rajiv made to his cabinet before the one in February 1988 contrasting it with Kamaraj who enabled RV to continue as industries minister in Tamil Nadu for an entire decade. Having commented on Rajiv's "backstage operators", he is appalled when they moved up front to create unseemly scenes in the Rajya Sabha with Rajiv doing nothing to stop them provoking vice-president S D Sharma to tears. On the handling of the Defamation Bill, RV bemoans "Rajiv Gandhi's experience with parliament was rather limited. His close associates were also novices in parliament." The frustration of the mentor was not only that Rajiv did not consult him on several issues but that he did not seriously follow up advice—sought or unsought—that was given. Clearly there was a technology gap in addition to a generation gap. On one occasion RV complains "Rajiv Gandhi had a habit of taking notes of points made during discussions on small slips which he always carried in his pocket. I was told that he fed them into the computer for reference later. But nothing came out of these discussions." RV's frustrations with Rajiv are most poignantly summed up in the following passage:

"Rajiv used to discuss some issues relating to the states with me but not necessarily all matters relating to all the states. Likewise, he used to discuss some names for inclusion in the cabinet but not each and every name. He was fully conversant with modern techniques of administration buttressed by computers, graphs and charts. His scientific mind would not accept the fact that human behaviour rarely conformed to graphs and charts. He had a fixed view that the older generation had failed the nation after independence. However much I remonstrated to him that it was the older generation which had transformed a benighted backward medieval India into a modern industrial one and also brought the country abreast with the world in science and technology, it made no impression on him. It must be said to his credit though that at all times he received my views with utmost consideration and respect. I often sent notes and memoranda on matters relating to administration but never worried as to whether they were accepted or not. They were like 'fire and forget' missiles."

At a more substantive level RV felt deeply let down by Rajiv reneging within three months on his assurance of "unconditional support" to the Chandra Shekhar government "certainly for one year and perhaps for the duration of the parliament's tenure". When RV first heard from H K L Bhagat in February 1991 that the support was likely to be withdrawn he "was shocked beyond words". "He was desperate to save the [Chandra Shekhar] ministry for at least another six months but his last ditch attempts to do so with Rajiv's emissaries and finally with Rajiv himself proved to be of no avail. With the withdrawal of Rajiv's support, Chandra Shekhar resigned early in March leaving RV to note: "I did not accept the resignation without feeling sorry for Chandra Shekhar. He was under constant strain from the pressures of the Congress Party which I am afraid assumed that it was the real government and Chandra Shekhar only a proxy. The office hungry coterie of the Congress Party used to misguide Rajiv Gandhi that Chandra Shekhar's attempts at building up a good image could prove deleterious to his image. Looking back after two years, I realise my naiveness (*sic*) in accepting the Congress assurance of 'unconditional support' to Chandra Shekhar."

Obviously the emotional bond between RV and Rajiv (whatever that was) had clearly ruptured by this time for when RV receives news of Rajiv's assassination in June 1991 all that he has to say is "I was shocked and did not want to believe it". Contrast this with RV's fulsome reaction to the death of M G Ramachandran: "An indescribable affinity had developed between us. He had the highest regard for me but more than that there was genuine affection between us. At his death I felt overcome by uncontrollable

grief and hastened away from the sorrowful scene" RV's final encomium to Rajiv ('a vibrant youth with a smile adorning his charming face', etc) is in stilted officialese, very much like good certificates recorded in the character rolls of promising young civil servants Furthermore, RV does not show the good grace to stop with pronouncing *bonum* on the *nisi* The very next paragraph refers again to Rajiv's inexperience in parliamentary matters and how because of it his image of 'Mr Clean' suffered an 'eclipse' In sum, in RV's assessment, Rajiv did not prove to be quite the 'Suitable Boy' for India's prime ministership

II

With this background, it is time to turn to RV's conception of the constitutional role of the president and how he applied it in practice to the legal and constitutional issues he had to deal with Given the adventuristic inclinations of Zail Singh his immediate predecessor it was to be expected that RV would take pains to emphasise his resolve to function strictly within the four corners of the Constitution He has variously described himself as 'a copy book president who would act strictly according to the rules', he has pointed out that the president is 'a shorthand' or 'euphemism for the union government only a symbol of the state' and not its executive authority and has claimed that he has consistently resisted all attempts to make the office of the president a second centre of authority for the country' At the same time RV realises that the copy-book president does not have to entirely degenerate into a rubber stamp or an ornamental symbol After reiterating that "the president was not an appellate or supervisory authority over the prime minister and his cabinet", RV goes on to observe that the president could return the cabinet proposals for reconsideration if he noticed any infirmity in them He could also, like the Crown in England advise guide and warn' the cabinet but should abide by the decision of the council of ministers"

This view of the presidency, modelled on the relations in Britain between the crown and the executive, is useful so far it goes There are, however important differences between the two countries First, Britain does not have a written Constitution while ours is a very detailed one limiting the role for conventions *vis a-vis* that entailed by the letter of the Constitution Second, the structures of the polity in the two countries are different the UK, for instance, is unitary while India is a federation This means that British parallels are not available in a number of areas for eliciting the conventions that need to be followed Third, and most important the Queen in England, as Ivor Jennings pointed out, "is not a politician, she is not controlled by politicians, she is just the daughter of her father" In India, in contrast, the president is elected to his office through a political process He too, like the British monarch, is expected to keep himself above partisan politics but to do so he needs to himself believe in being non-partisan and show the will and effort to rise above his political antecedents and affiliations Fourth, and quite apart from the British model, the president will need to be true to both the spirit and the letter of the Constitution He has to reconcile both of his primary responsibilities in situations in which they might come into conflict The first is to act in accordance with the aid and advice of the council of ministers as required by the letter of Art 74(1) The second, and the more comprehensive responsibility, is that which stems from his oath of office 'to preserve, protect and defend the Constitution and the law', in effect to be true to the spirit of the Constitution

It is in this background that we will have to evaluate RV's record in dealing with the constitutional and legal problems that confronted him Was he non-partisan? Were his interpretations of the Constitution substantive or procedural? What were the motivations and reasoning behind the courses of action he took? Did he take all steps available to him to preserve, protect and defend the spirit of the Constitution within its letter utilising the status of his office to 'advise guide and warn' and resorting to the provisions of the Constitution which allowed him scope for intervention? The reader can answer these questions for himself from the discussion that follows

The controversy that RV had to immediately deal with on assuming office related to the postal bill on which Zail Singh had openly expressed his reservations RV could have returned it to parliament for reconsideration but instead he sent it to the attorney-general for opinion This was in October 1987 .He then took no action to follow up the matter for more than two years and comes back to the subject only after Rajiv had quit with the bland statement that Rajiv's government had not communicated to him the attorney general's advice that the bill offended the Constitution Early in January 1990, V P Singh suggests that the bill could be returned to parliament for reconsideration of Clause 16 which conferred the power to intercept postal articles RV "immediately acceded to the avice" bringing "the unpleasant episode to an end Quite patently, RV was much more worried about embarrassing Rajiv than about a serious invasion of privacy

Early in 1988 the 59th Amendment to the Constitution was tabled proposing *inter alia* to introduce 'internal disturbance' as a ground for declaring an Emergency in the Punjab This met with strong opposition from the press, jurists and opposition parties Not being able to persuade Rajiv to settle for an amendment that would extend the permissible period for president's rule from one to three years in Punjab, RV discovered that although the amendment bill had been submitted to him under Act 111 of the Constitution the relevant Article was 368(2) The former would have required him to take a stand on whether to give assent or return the bill for reconsideration while the latter, dealing as it did with a constitutional amendment, made the president's assent obligatory RV's delight at this discovery is hardly disguised Once again he was off the hook

In September 1988, the Defamation Bill was adopted by parliament RV expressed his reservations in informal discussions with a group of ministers but he did not take it up with Rajiv, much less make it clear that his assent would not be forthcoming for this black legislation Faced with very strong opposition from the media and in parliament, Rajiv himself did not proceed with the bill Once again, RV's sigh of relief audibly comes through in the narrative

In October 1988 RV had to deal with the mercy petition of Kehar Singh under Art 72 of the Constitution The sentence of death on Kehar Singh had been confirmed by the Supreme Court but there were considerable well argued grounds to presume his innocence However, as RV himself discloses, pressure was exercised on the president by Rajiv's emissaries on more than one occasion to reject the mercy petition RV's initial move was to find a legal basis which while compelling him to reject the petition would, concurrently, save him from the charge of conniving in a miscarriage of justice This became available in the attorney general's opinion that Art 74 applied to mercy petitions as well At this juncture, Ram Jethmalani requested the president to give him an opportunity to make a final representation on behalf of Kehar Singh RV turned down the request on the procedural ground that precedents did not require him to do so This was challenged before the Supreme Court by Jethmalani In December 1988, the Court while disallowing oral representation as a right, pointed out that the president was free to himself scrutinise the entire record and come to a different conclusion from that arrived at by the Court in regard to the guilt of the accused and the sentence imposed Despite the Supreme Court's open invitation to him to do so, RV chose not to apply his mind to the facts of the case If he had been convinced that Kehar Singh's guilt had not been proved beyond doubt, he could have asked the cabinet to reconsider its advice, or threatened to resign, or even resigned rather than being a party to sending a possibly innocent man to death All that RV did was to take refuge once again under Art 174. Kehar Singh's mercy petition was reject and he was executed in January 1989 RV

was relieved that the execution, which took place after Guru Nanak's birthday in November, did not 'mar' a prayer congregation arranged in Rashtrapati Bhawan to mark that occasion. Such was RV's response to a situation which should have caused an intense moral dilemma to any ordinarily decent person.

Shanti Bhushan's application to the president for permission to prosecute Rajiv on Bofors based on documented material in the press proved particularly troublesome to RV. Here again, his first ploy was the by now familiar move to duck under Art 174. He tried hard to do so but two repeated opinions from the attorney-general confirmed that the president in this case *had to act on his own discretion* and not on the advice of the council of ministers. In fact, this should have been obvious for the cabinet was not likely to accede to the prime minister's prosecution. It was, thereafter, that RV went through Shanti Bhushan's application and came to the conclusion that "the allegations were just arguments based on surmises". If such was the case, it is not clear why he took all the trouble he did to ascertain the legal position in the first place. What is clear is that the positions that RV took on the Kehar Singh case and in the Shanti Bhushan case were mirror images of the same syndrome. In the former, RV took refuge under the law to ignore the facts while in the latter, when the law did not provide the way out, he interpreted the facts to arrive at the pre-ordained conclusion. *De jure* in one case and *de facto* in the other he did precisely what Rajiv would have wanted done.

The only case in which RV used the proviso to Art 74(1) to seek reconsideration of the cabinet's advice was in regard to the dates for parliamentary elections in Assam and Punjab. Here, the Congress was 'bitterly opposed' to clubbing Punjab and Assam with general elections to parliament; this coincided with RV's own views in the matter; and the Chandra Shekhar government in April 1991 was at its fag end. Rocking the boat when it was itself capsizing did not demand excessive courage on RV's part.

RV takes much pride and satisfaction in piloting the country through the changes of government that occurred in 1989, 1990 and 1991. It is in these contexts that he refers to his role as an 'emergence lamp' which comes into operation when electricity fails and becomes dormant on its restoration. The emergency lamp flickered more often than it remained steady. In 1989, the straightforward option following British precedents available to RV was to call upon the largest single party which was the Congress, but RV shrewdly realised that that would invite public criticism as favouring a party that had lost the mandate of the people. This dilemma RV neatly got around by persuading Rajiv, through official and political emissaries, to unilaterally forgo the claim to form a government. In 1990, RV's decision to install Chandra Shekhar as prime minister was thoroughly questionable. This government of defectors had no mandate whatsoever and derived its primary support from no more than 57 MPs. RV approved Chandra Shekhar tabling the motion of confidence in parliament although the Speaker had not decided upon the legitimacy of the split in the Janata Dal. RV did not demand or obtain from Rajiv a cast iron written commitment to support the Chandra Shekhar rump for any specified reasonable length of time. The high cost to the nation in the uncertainty and corruption that followed is well known. However, RV not only did not anticipate it but goes out of the way to express his high regard, among other things, for Chandra Shekhar's 'integrity' and his 'sorrow' when the ignorable government met its well deserved early end in March 1991. Later, in June 1991, the choice of Narasimha Rao as prime minister posed no problem: he was the leader of the largest single party and was able to secure the needed majority in parliament.

On two occasions during these changes RV mooted the idea of a national government and systematically pursued it with the leaders of all major parties. The first was in 1990 when the Janata Dal government fell and the second was after Rajiv's assassination and prior to general elections in 1991. These exercises in political gerrymandering went well beyond the proprieties of a constitutional president. Nor did the objective situation on either occasion call for a national government as the one and only way to hold the polity together. Quite understandably, RV's initiatives for a national government have led to speculations. Did he want to become the prime minister himself? Or, at least, ensure that Rajiv would not come back as prime minister? RV's disclaimers on both counts cannot be taken as the last word and one will have to wait for the full and true story to come out in due course.

How did RV deal with the imposition of president's rule in the states under Art 356 of the Constitution and what lessons could be learned on the role of the president in such cases from his practice? Of the nearly 100 cases of the use of Art 356 so far as many nine took place during RV's tenure. Five of them (Tamil Nadu 1988, Nagaland, Mizoram, Meghalaya and Karnataka 1989) were in Rajiv's period; two (Karnataka 1990 and Pondicherry) in V P Singh's period; and the other two (Tamil Nadu 1989 and Haryana) during the Chandra Shekhar regime.

Stripped of the specific circumstances that attended them, the underlying issue in the Tamil Nadu 1988, Nagaland, Mizoram, Meghalaya, Pondicherry and the two Karnataka cases was that the governors did not give an opportunity to an existing incumbent or to a new claimant to prove his majority in the legislature by a floor test, i e, on the basis of a majority of members present and voting in the house. It is to RV's credit that he clearly comes out with the view that the floor test should be the sound criterion for deciding on the choice or viability of governments. He did made a valiant attempt in the Karnataka 1989 case, when S RBommai was the chief minister, to persuade the government to accept this position. Once again, he showed some 'hesitation' when V P Singh clamped president's rule in Karnataka in 1990 when Veerendra Patil was the chief minister. However, on neither occasion did he press for a formal reconsideration under the proviso to Art 74(1). In all other similar cases—Tamil Nadu 1988, Nagaland, Mizoram, Pondicherry and Meghalaya—he simply rubber stamped the cabinet's decision without a formal or informal remonstrance or even a mental reservation. (Curiously, RV's otherwise elaborate narrative does not even refer to the imposition of president's rule in Meghalaya on October 11, 1991. We are only informed that on October 8 he attended the Air Force day and that on October 13 the "First Lady organised the festival of dolls in Rashtrapati Bhawan and invited all the VIP ladies of Delhi". Sandwiched as it was between these two momentous events, distant Meghalaya must have slipped from the president's consciousness.)

It is interesting that three of these cases—Karnataka (1989), Nagaland and Meghalaya—were later to be subjected to judicial review by the Supreme Court along with the dimissals of the BJP governments in Himachal Pradesh, Madhya Pradesh and Rajasthan. The Supreme Court in its judgment of March 1994 struck all three of them down as unconstitutional although no practical relief could be given since fresh elections had by then been held and new governments formed in all three states. The court also passed strong strictures both against the governors and against the union government. In the Karnataka 1989 case, P B Sawant and Kuldip Singh J J observed:

> We are of the view that this is a case where all cannons of propriety were thrown to wind and the undue haste made by the governor in inviting the president to issue the proclamation under Article 356(1) clearly smacked of mala fides. the proclamation issued by the president on the basis of the said report of the governor and in the circumstances so obtaining, therefore, equally suffered from mala fides. A duly constituted ministry was dismissed on the basis of material which was neither tested nor allowed to be tested and was no more than the *ipse dixit* of the governor. The action of the governor was more objectionable since as a high constitutional functionary, he was expected to conduct himself more fairly, cautiously and

circumspectly Instead, it appears that the governor was in a hurry to dismiss the ministry and dissolve the assembly The proclamation having been based on the said report and so called other information which is not disclosed, was therefore liable to be struck down

Interestingly, when the Meghalaya case went up to the Supreme Court, even the attorney-general who appeared for the union government did not seek to defend the imposition of president's rule The court disposed of it with the following stricture

The unflattering episode shows in unmistakable terms the governor s unnecessary anxiety to dismiss the ministry and dissolve the assembly and also his failure as a constitutional functionary to realise the binding legal consequences of and give effect to the orders of this court What is worse the union council of ministers also chose to give advice to the president to issue the proclamation on the material in question It is not necessary to comment upon the validity of the proclamation any further save and except to observe that *prima facie* the material before the president was not only irrational but motivated by factual and legal *mala fides* The proclamation was therefore invalid

The Nagaland proclamation was also held unconstitutional on the ground that no opportunity was given to chief minister Vamuzo to test his strength on the floor of the house

In Haryana, Chauthala lost his majority within five days of getting re elected as chief minister in March 1991 He refused however to accede to the governor s advice to prove his majority and recommended the dissolution of the assembly Chauthala's case was similar to that of Chandra Shekhar at the same time at the national level except that the latter knowing that he too did not have a majority, had resigned and recommended the dissolution of parliament But then what was sauce for the goose was not the same for the gander and, instead of ordering fresh elections in Haryana, the state was brought under president's rule

The dismissal of the DMK government in Tamil Nadu in January 1991 was the most flagrant abuse of Art 356 in the entire history of the Constitution Unlike in the other cases, the issue here was not the loss of support to the government The dismissal took place on the ground that law and order had broken down in Tamil Nadu, due to LTTE activities, to such an extent that it was not possible to carry on its government in accordance with the Constitution This was entirely concocted and wholly baseless There was no such breakdown of law and order, the governor, S S Barnala, not only did not give any report of internal disturbance but positively refused to give such a report, the Tamil Nadu government had all the time been co-operating with the centre in tackling the activities of Sri Lankan militants and had done so on its own as well, while dismissing the government, no evidence was provided in the presidential proclamation for a breakdown of law and order, no such evidence was provided to parliament either when seeking approval for the proclamation, nor does RV's narrative contain anything more than the usual rumours, gossip and innuendo on the subject Soon after the dismissal, I had gone into the full circumstances of the Tamil Nadu case (in *Frontline*, Madras, February 16, 1991) and had commented as follows on the president s role

Under Article 74 the president himself had no option except to act on the advice of his council of ministers In the bottom line, he was only a rubber stamp but he reached the bottom line pretty fast and without much resistance He did not find it necessary to discuss the situation with the governor who was available in New Delhi nor did he advise the prime minister and his cabinet to reconsider the matter although he was entitled to do so under Article 74

The president could have very well argued for not dissolving the legislature for even in the event of a breakdown' of law and order the legislature could have been suspended for a while when law and order was being restored and the democratic process revived thereafter But this is surely a naive question for the real purpose of the Chandra Shekhar government which was being blackmailed by the Congress(I) and the AIADMK, was not the imposition of president s rule for restoring 'law and order but the dissolution of the assembly which is what the blackmailers wanted All in all the president showed utter disregard for the spirit of the Constitution Morally and substantively he was not true to his oath of office which required him to preserve, protect and defend the Constitution and the law' It could certainly be said that he acted 'wantonly'

This conclusion is fully corroborated, in fact strengthened, by RV s recital of the sequence of events that culminated in the dismissal of the Tamil Nadu government on January 30, 1991 He admits to the intense political pressure brought on him by the Congress and AIADMK By end-January 1991, relations between Rajiv and Chandra Shekhar had irretrievably soured, the latter was prepared to submit to any kind of blackmail from the Congress to continue in office, and RV himself was keen on Chandra Shekhar s government being kept alive for as long as feasible, and if this required the dismissal of the DMK government in Tamil Nadu, he was hardly the one to be displeased about it It was not surprising, therefore, that RV acted with amazing alacrity in the matter Appropriately, Chandra Shekhar disclosed to RV his intention to murder democracy and federalism in Tamil Nadu when both were together at the Martyrs' Day function at Rajghat on the morning of January 30 RV asked him to come over 'immediately' to Rashtrapati Bhawan and told him to submit his proposals Later, in the evening, "the prime minister said he wanted the presidential proclamation issued the same day and that papers would be reaching me [i e, RV] late at night' Around 9 30 pm when V P Singh and other National Front leaders met the president to represent that the dismissal of the Tamil Nadu government would be "illegal, immoral and unconstitutional" RV simply told them that although the dismissal was contemplated he had not received any proposal Even if this was true, RV did not indicate that it was imminent He pointed out his constitutional obligation to accept the advice of the cabinet When some members of the delegation suggested that he might advise the government against such action, RV did not react Within a few minutes of the departure of the opposition leaders (presumably at around 10 p m), the proposals, according to RV's account, were put up to him He went through the file "carefully" and "pondered over the constitutional position" He came to the conclusion that it was his duty to act on the advice of the cabinet and it was for parliament to go into the merits of the decision Thereupon, "I issued the proclamation dismissing the DMK ministry immediately' Apparently all this must have taken place at lightning speed for All India Radio announced the decision in its news bulletin at 10 20 pm that night

The imposition of president's rule in Tamil Nadu came in for very strong criticism in the press all over India Ten opposition parties joined together to boycott the presidential address on account of his "shameless assault on the Constitution and the institutional structure of democracy" and accused the president of 'having abdicated his primary responsibility of upholding the Constitution in letter and spirit" All this is derisively dismissed in RV's book with the observation that the "hysteria was both exaggerated and biased"

In the ultimate analysis, RV might not have been able to prevent the unconstitutional application of Art 356 to Tamil Nadu in 1991 bound as he was by Art 174 But, in this case it was not that he tried (albeit feebly) and failed (as in the Karnataka episodes) or did not try at all (as in the other states) but that he was an active accomplice in defrauding the Constitution

III

The public image that RV conveys in visage, attire and speech is one of simplicity and dignity He seeks to buttress this image in several self-congratulatory passages in the book "All I wanted", he says, "was to serve the country honestly, diligently and effectively When C Rajagopalachari laid down office as the last governor-general of India, Pandit Nehru said of him that he was a man who looked upon a palace as a cottage

and a cottage as a palace. I was determined to emulate his example and remain my essential modest self, not overawed by the pomp and panoply of residence in Rashtrapati Bhawan" However, numerous passages in the narrative reflect the vainglory of Lord Curzon rather than the simplicity of Rajen Babu or Rajaji. RV was continually overawed by the "sheer majesty of Rashtrapati Bhawan, its massive structure, extraordinarily high ceilings and long winding corridors". So was he by the bodyguards "all six feet and over" with their "blue-and-gold turbans and white long coats with gold girdles" mounted on "fine bay horses no less distinctive than their riders". He was thrilled by the "gleaming black six-door limousine" in which the president rides to parliament where, on arrival, the usher announces the "Mahamahim Rashtrapatiji" in "stentorian tones" Nor should one miss the 640 kg silver chair in the Ashoka Hall seated on which the president receives the credentials of ambassadors. There is an enormous amount of such trivia wrapped in tinsel throughout the book.

RV was a glutton when it came to foreign tours. Starting with the Soviet Union in March 1988, he visited 18 other countries before concluding with China in May 1992 Major countries included the then USSR, Germany, the UK and China. But the smaller ones were not neglected: Mongolia, the Netherlands, Finland, Cyprus, Czechoslovakia, Bhutan, Zimbabwe, Zambia, Tanzania, Seychelles, Portugal, Malta, Vietnam and the Philippines Funeral visits were made to Pakistan and Japan and one more to the latter for Akihito's coronation. The wonderful sights that RV and his family saw at the expense of tax-payers in India and in the host countries included: Lake Baikal in Siberia; the dykes in the Dutch North Sea; the Arctics in Lapland; the romantic coasts of Portugal and Cyprus; the Grand Harbour of Malta and Ha Long Bay in the South China sea; the Paro valley in Bhutan; the Bird Island in Seychelles; Victoria falls in Tanzania; an air cruise around Mount Kilimanjaro; train rides (superfast) in Germany and (royal) in Britain: palaces in Portugal, Malta, Manila and Xian; and, of course, the Great Wall of China. Only a bumper issue of the National Geographic magazine can do justice to them and it is a pity that the reader has to be content with RV's pallid accounts of his voracious tourism.

Rights towards the end of it all RV cancelled proposed visits to Chile, Turkey and Italy on grounds of economy. He realised that his entourage typically consisted, in addition to 3 family members, of 24 persons from his official and personal staff. This was in addition to a dozen security men and the aircraft security personnel. RV says "However much I tried to reduce the numbers, I could never succeed". It is not clear why since Art 174 could not have stood in the way! RV also discovers that the visits to Chile, Turkey and Italy alone would have cost around Rs 10 crore to the exchequer. Extrapolated, the visits to the 20 countries he covered during his presidential tenure would have cost about Rs 60 crore or Rs one crore a month on foreign visits alone. This must, however, be offset by the saving of Rs 15,000 a month in staff salaries for effecting which RV takes credit early in his account.

To the reader who has stayed with me thus far I shall end with an apology and a piece of advice. The apology is for the length of the review but let me add in extenuation that it is only 3 per cent of the length of the book. The advice is not to waste time in going through this dull and depressing volume. And, certainly, not to spend money in buying it. I am sure RV will not mind either for he is reported already to have earned Rs 10 lakh in royalties.

Water Development and Management

B D Dhawan

Water for Sustainable Development in the 21st Century edited by Asit K Biswas, Mohammed Jellali and Glenn Stout: Oxford University Press, Delhi, 1993; pp 273, Rs 395.

WE are in the midst of the last decade of the 20th century. How the problems of this closing century might become more formidable in the next century has lately become a topical subject for conferences and seminars. The volume under review carries a set of papers, presented at the VIIth World Congress of the International Water Resources Association (IRWA) at Rabat in Morocco during May 1991. The theme for this Congress was nothing else but the very title of this volume.

This volume consists of three parts. Four main lectures delivered at the Congress constitute part I. The papers relating to issues in water resources policy, numbering 11 in all, are set out in part II. The final part III consists of nine papers under the heading of water resources management. All these selected papers comprise one-tenth of the over 200 papers prepared for the Congress which was attended by 700 participants from 55 nations. Readers must bear in mind that not only the peer-review process of selection of papers for the volume has been adopted by the three editors but also the editors seem to have played quite a role in extensively modifying the papers. In that case, a reader must think twice before faulting a paper's author for any incongruencies in exposition of ideas or in the statistics presented. Let me cite a concrete case to substantiate the remark.

Unabated growth in population is repeatedly stressed in the volume as the key causal factor behind water becoming a scarcer resource in the next century. "Present estimates indicate that the current world population is likely to double to 10.64 billion by the year 2050, out of which the less developed countries will contribute 8 per cent or 9.29 billion... While it is not easy for most individuals to grasp the real meaning of billions of people, it should be seen in its proper perspective. If we resettle all 5.368 billion people of today's world (early May 1991 estimate), in an African country like Zambia whose area is 7,53,000 km², a family of four will have an area of 561 km² which is a typical single family one-storey house in North America with a front and a backyard" (p 9). Here, two mis-statements can disturb a discerning reader. One, the contribution to doubling of world population by 2050 from the less developed countries is neither going to be as low as 8 per cent, nor as high as 9.29 billion. Two, a family would have 561 square metres of earth (not 561 square kilometres) when the world population is mapped on the Zambian land mass.

The central message of this volume can be stated as follows. Water can no longer be treated as a cheap or low-cost resource in today's world. Not only sizeable cost is entailed in tapping it for human use but mankind faces everywhere a rising supply cost curve, marginal resource cost of developing newer water resources is presently two or three times that of the already tapped ones. No less importantly, there are substantial 'external' effects or costs of water use, e g, waste water from household and industry sectors has to be treated before its disposal to water bodies whose users otherwise have to suffer the effects of using polluted waters. Environmental and social concerns (eg, for the dam oustees) have further added to costs of water resources development projects. In the face of these rising costs, financial resources with the public bodies are getting frittered away in huge subsidies in maintaining the existing works. So water pricing needs to be addressed squarely Without right prices, neither adequate investment resources are likely to flow into the water sector nor water users would find it worth their while to economise in the use of water. The need for such economising is the greatest in irrigated

agriculture which absorbs almost three-fourths of total water supplies in Asia. With right pricing, this sector can potentially spare much water for the rest of the economy. According to El Ashry's paper it now takes about 1,000 tons of water to produce one ton of grain (2,000 tons in the case of rice grain).

Two papers in the part I merit readers' attention. One is the presidential address by Asit K Biswas. He identifies four principal causes of the water crisis all over the globe. The academicians' clamour for setting water prices right for all consuming sectors does not appear to enthuse him. And he is much perturbed over increase in international conflict on water in the next century – nearly 47 per cent of river waters (80 per cent in Africa) are shared by two or more nations. The second paper is by Malin Falkenmark who has some pithy and provocative observations on issues in development and environment. He is appalled by the "past water illiteracy among environmental experts". "Today's predicament is an extremely blurred picture of the field of environment and development. The international dialogue contains more words than genuine understanding."

The part II begins with an interesting paper by Mohamed T El Ashry on the problems of water resource management in the arid and semi-arid regions with particular reference to the western US, north west Mexico and Aral sea region of Central Asia. Salinity, waterlogging and ground water depletion are major problems here. Water table in Mexico is reported to be receding at the rate of 1.5 metres (about 5 feet) per year. The Aral sea and the surrounding regions are experiencing extensive environmental degradation, thanks to the full exploitation of the two major rivers (Amu Darya and Syr Darya) of this region for development of irrigated farming dominated by cotton crop. Because of lack of flow of these rivers into Aral sea, water level dropped from 53 to 39 metres during 1960-89. (The Aral sea problem is discussed in greater detail by Genady N Golubev in his paper in the part III.)

Hiroshi Hori writes about the super scale water resources projects for which Global Infrastructure Fund (GIF) has been created in Japan. Merits and demerits of storing Ganga-Brahmaputra waters for use in southern and western India are spelt out by him. Gert A Schultz is worried about the impact of land use changes on river flows: increased imperviousness of catchments will give rise to more severe floods and also to more severe low flows. Biomass strategy of watershed development in drylands is commended by J Lundqvist, K R Datye and M Falkenmark. For a landholding of 1.2 ha in semi-arid parts of Maharashtra, about 0.4 ha is considered for crop activity only—the rest is earmarked for tree crops. Water harvesting through check dams, earth bunds, and wells is of crucial importance. (This paper needs to be read along with another paper in the part III, wherein S Y Kulkarni highlights benefits for developing water resources in dryland areas through big dams with particular reference to the Mula project from western Maharashtra.) The importance of big dams is underlined by Jan A Veltrop, with striking data for the world as a whole and by continents. Over 85 per cent of the 36,000 big dams (height above 15 metres) were built during the last 35 years, with a total storage capacity for 6000 km³ of water which hardly constitutes one sixth of the total flows in the rivers.

Farmers in particular and all users in general in low rainfall regions suffer from uncertainties of water supply. Norman J Dudley and Warren F Musgrave plead for reservoir sharing rights. "Capacity Sharing (CS) is a system whereby users are allocated long-term or perpetual rights to percentage shares of reservoir inflows and percentages of empty reservoir capacity or space for storage of their inflows. It is as if each user owns a small reservoir on his own small stream." The concluding paper in the part II is the statement by the IWRA Committee on Water Strategies underlining the imperative of eradicating water blindness through educational efforts at all levels (including press seminars for journalists) which the reviewer too strongly commends.

Ground water depletion has two dimensions: quantitative and qualitative. Till recently there has been much concern about quantitative depletion. A Das Gupta focuses on the qualitative aspect, namely, ground water contamination or damage. He too strongly pleads for the imperative of education in this area. "The public should be educated on a long term basis about ground water and pollution. In many cases private entities disposing waste water are unaware of the impact of their operation on ground water quality. Protection of ground water quality requires a long range perspective by water users and potential polluters, often difficult in today's climate."

The salient features of water management in Japan are brought out by Y Takahasi in his paper. The flood damage here was sought to be mitigated through embankment works as well as dams. Between 1951 and 1978 over 750 big dams were built. As a result, there are now few major rivers without dams, notwithstanding the rise of anti-dam movement. There are three noteworthy papers on Egyptian water management problems. A Abu zeid and S Abdel-dayem report that drained water constitutes over one-third of surface irrigation water in the Nile Delta. M S Semaika and R A Rady explore the consequences of global warming for crop activity in Egypt. Because of marked rise in irrigation (evapo-transpiration) needs of crops owing to increase in temperature, agronomists have to explore raising crops of shorter duration in the less hot parts of the year. How exploitation of seeped-in canal waters in the Nile Delta/Valley through tube-wells can both augment water supplies and serve as a means of drainage is briefly explained by K Hefny, Fatma Attia and Albert Turnhot. The underlying stock of ground water is of the order of 500 billion m³ (three times the storage of Lake Nasser formed by the Aswan dam) to which annual recharge occurs at the rate of 8 billion m³ (about 3 billion m³ flow back to the Nile river).

S Y Kulkarni reports a rate of return of 19 per cent for the Mula project. Over three-fourths of the returns is in the shape of increased income from crop activity (much of it is from raising new crops, especially sugarcane, which cannot be grown without dependable source of irrigation). The noteworthy aspect of this ex poste evaluation is that it is inclusive of indirect benefits from canal waters, notably from improved ground water availability from seeps-in canal water that promotes ground water-based farming. Unfortunately, many errors have crept into the paper as it is printed, e g, employment impact of canal irrigation is mentioned in per cent days (it should be person days). A patient reader, however, can figure out the corrections for the errors of commission/omission.

The IWRA needs to be applauded for promptly bringing out the papers in published form. Academic people especially from the developing countries, cannot attend international conferences. They would find such volumes worthwhile reading, especially in widening their horizons and in identifying nuggets of similarities or dissimilarities in problems of water development and management in different countries of the world.

Variations in Educational Performance in Tamil Nadu

A Vaidyanathan
Manabi Majumdar

Drawing primarily on the census data, this paper maps the inter-taluk variations in the level of literacy in the state of Tamil Nadu as well as changes in this respect over time. The data show significant variations across taluks in terms of literacy achievements during the period between 1971 and 1991. To take the analysis one step further, this paper presents, albeit in a limited manner, some facts on educational facilities and literacy status in the villages of two Tamil Nadu districts. The underlying motivation of such disaggregated study is to develop useful typologies of taluks/villages which may, in turn, constitute the basis for both designing micro studies as well as discerning macro trends.

I
Introduction

THE purpose of the present study is to map the inter-taluk variations in the level of literacy in the state of Tamil Nadu as well as changes in this respect over time, drawing primarily on secondary data. In particular, the rural literacy scene in the taluks is our focus of attention. That the rural population is educationally the most disadvantaged in our country is old news. But the multiple socio-economic and political handicaps which debilitate their educational aspirations are not equally strong across the rural universe.

There exist considerable spatial variations in the level of educational achievement (measured here only in terms of rural literacy levels), sufficiently intriguing to merit closer scrutiny. The underlying motivation of our present exercise is to trace out the magnitude of such variations across the taluks of Tamil Nadu (both in initial levels and subsequent rates of performance) as well as to identify, albeit in a limited manner, the relevant socio-economic factors that might account for such disparate performance records.

To take the analysis one step further, this paper offers, at the end, some facts on educational facilities and literacy status in the villages of two Tamil Nadu districts, namely, North Arcot and South Arcot. This sequential and progressive move from the taluk to the village level constitutes an attempt to make clear what is known and what is not known empirically about literacy achievements in the micro-setting of villages. Such analysis at the disaggregated level, we hope, would help in developing useful typologies of taluks/villages which, in turn, may constitute the basis for both designing micro studies as well as discerning macro trends.

II
Tracing the Terrain of Literacy in Tamil Nadu: A Profile of Taluks

The decennial census reports give data on the overall literacy rates by sex, for rural and urban areas right up to the village/town level.[1] The primary census abstracts also provide information on nature of school facilities, distance, road density, access to public transport and the like. We present below the results of an analysis of literacy

Table 1: Number of Taluks by Level of Literacy in Rural Tamil Nadu, 1971-1991

Literacy Rate (Per Cent)	Number of Taluks (overall rural literacy)			Number of Taluks (rural male literacy)			Number of Taluks (rural female literacy)		
	71	81	91	71	81	91	71	81	91
0-10	0	0	0	0	0	0	5	0	0
10-20	5	0	0	0	0	0	66	30	1
20-30	41	15	1	5	0	0	37	61	24
30-40	56	53	14	22	13	1	3	18	63
40-50	9	40	65	52	29	14	2	3	20
50-60	4	6	29	32	60	50	3	4	3
60 and above	1	3	7	6	15	51	0	1	5
Total no of taluks	116	117	116	116	117	116	116	117	116
Tamil Nadu (state avg (per cent))									
Total	39.5	46.8	54.3*	51.8	58.3	63.8*	26.9	35.0	44.6*
Rural	32.1	38.5	47.6	45.1	51.2	58.2	19.0	25.8	36.7
Urban	56.4	63.4	68.1	66.8	72.5	74.9	45.4	54.0	60.9

* The 1991 literacy rate for population aged seven years and above has been recorded to be 62.7 per cent, the corresponding sale and female literacy rates are 73.7 per cent and 51.3 per cent respectively.

Souce: Calculated from Census of Population: 1971-1991.

Table 2: Mean Change in Male-Literacy Ratio in Rural Tamil Nadu, 1971-1991

Overall Rural Literacy Level in 1971 Per Cent	Mean M/F Literacy Ratio 1971	Mean M/F Literacy Ratio 1981	Mean M/F Literacy Ratio 1991	Mean Change in Gender Disparity: Between 71 and 81 (M/F 81-M/F 71)	Between 71 and 81 (M/F 91-M/F 81)	Between 71 and 91 (M/F 91-M/F 71)
10-20	3.0	2.4	1.8	-0.61	-0.56	-1.17

as well as the growth therein over the period 1971 to 1991 and a few associated characteristics in rural areas of all the taluks in Tamil Nadu. The data show significant variations across taluks and villages in literacy rates both overall as well as among different groups of population (rural-urban, male-female) during the period between 1971 and 1991.

But, before we carry on, we must mention some adjustment which had to be made in the data: the Indian census data on literacy prior to 1991 pertain to the whole population, while in the 1991 Census persons aged seven and above are considered. For this reason, strictly speaking, comparisons between 1991 and earlier census figures are not quite appropriate. Adjusted figures are available for 1981 and 1991 at the district, state and national levels; similar adjusted numbers for the taluk level for 1971 or 1981 have not been thus far available. To get around this problem—admittedly in a less than ideal way—we have derived the overall literacy rates in 1991 by dividing the number of literates (aged 7+) by the total population, assuming that the number of literates in 0-6 age group is negligible.

Table 1 gives the distribution of all the taluks in Tamil Nadu by levels of (rural) overall, male and female literacy in 1971, 1981 and 1991. The overall literacy rate in rural Tamil Nadu has recorded a significant rise from 32 per cent in 1971 to 38.5 per cent in 1981 and 47.6 per cent in 1991. The increase has been relatively faster in the 80s. Female literacy in the rural areas—which nearly doubled from 19 per cent in 1971 to 36.7 per cent in 1991—rose considerably faster than male literacy (45 per cent to 58 per cent). Literacy rates—both overall and by sex—rose faster in rural areas compared to urban areas. The sex disparity as well as rural-urban disparity have thus narrowed.

Shifts in the frequency distribution of taluks in terms of overall literacy levels between the three census periods reflect the rise in the overall literacy rates. In 1971, nearly four-fifths of the taluks had a literacy rate ranging between 20 and 40 per cent. In 1981, slightly less than 80 per cent of taluks registered literacy rates between 30 and 50 per cent; by 1991, about 80 per cent taluks had literacy rates ranging between 40 and 60 per cent.

The shift is much more marked in female literacy rates. The modal value of the literacy rate in 1971 was 10-20 per cent (nearly 60 per cent of all taluks fell in this category). By 1991, the modal frequency was in the 30-40 group (again comprising 60 per cent of all taluks).

Table 2 delineates differences in male-female literacy rates in the three census years: In 1971, male literacy rate in rural Tamil Nadu was twice that of females, but with a wide variation around the mean. Interestingly, taluks with a low overall literacy rate showed a higher gender disparity, compared to high literacy taluks. There is in fact a strong inverse relation between the overall literacy rate and gender disparity in literacy. In other words, higher level of male literacy goes with higher level of female literacy *and* with lower level of gender disparity.

Over time the gender disparity had declined appreciably in all taluks. The dispersion in gender disparity across taluks has also declined. The decline has been much steeper among taluks with low level of literacy in the base year, compared to those whose populations were more literate. Indeed, the rate of decline in gender disparity is inversely related to the base level of literacy.

Table 3 portrays the rural literacy landscape of 1971 (which is treated as the base year in the present analysis) as well as the change in the educational terrain in the following two decades. There is a clear inverse relation between the extent of

TABLE 3: RELATION BETWEEN BASE YEAR OVERALL RURAL LITERACY LEVELS IN 1971 AND CHANGES BETWEEN 1971 AND 1991—TAMIL NADU TALUKS

Rural Overall Literacy Level 1971	Number of Taluks	Mean Rural Overall Literacy	Mean Rural Male Literacy	Mean M-F Literacy Ratio	Mean Proportion of SC-ST to Total Rural Population	Mean Increase in Percentage Points in Literacy Rate: Between 71 and 81	Between 81 and 91	Between 71 and 91
10-20	5	18.3	27.2	3.0	13.4	6.5	9.9	16.4
20-30	41	26.6	38.9	2.8	24.7	6.6	8.8	15.4
30-40	56	34.7	49.5	2.5	22.6	6.1	8.5	14.6
40-50	9	42.7	56.1	1.9	22.3	7.4	6.9	14.3
50-60	4	55.6	62.1	1.3	6.5	5.6	8.4	14.0
60 and above	1	63.3	70.1	1.2	7.4	4.3	6.0	10.3
All taluks	116	32.7	45.9	2.5	22.3	6.3	8.5	14.8

Note: The actual number of taluks has increased since 1971 (both in 1981 and more in 1991), but for the sake of comparability, we have incorporated the newly created taluks into the original ones from which the former have bifurcated/trifurcated.

* The coefficient of variation (CV) is standard deviation expressed as a percentage of arithmetic mean, a standard measure of dispersion free from the unit of variables.

** These were the clusters existing in the base year 1971. We record the relevant statistics in 1981 and 1991 for the same sets of taluks. To belabour one obvious point, these taluks will not necessarily fall under the same intervals in 1981 or 1991 and that the average overall literacy in 1981 and 1991 may not tally with the upper bounds of the intervals.

increase in literacy rates and the initial level of literacy: that is to say, low literacy taluks have recorded greater rise in overall literacy rates than those which already had high literacy in the 70s; as well as during 1971-1991 taken as whole. But this relation is not seen, at any rate as strongly, in the 1980s. In general, the taluks at lower levels of literacy in the base year (1971) have registered a greater positive change—a tendency that keeps our hope about a better literacy profile alive.

In Table 4, we report the average rural literacy (overall, male and female) across all taluks during the 1971-91 period and the dispersion around the mean. This is followed by a presentation of corresponding statistics for different clusters.

Several interesting features attract our attention: not only does the mean rural literacy show a secular increase (in all the three cases of overall, male and female literacy rates), but the dispersion around the mean (reflected through changes in the CV) is also steadily declining (the tendency being particularly pronounced in the case of female literacy). This implies that the gap between low-literacy and high-literacy taluks is gradually shrinking.[2]

The trends within different clusters show a more complex pattern, however. The dispersion around the mean (especially in case of overall and female literacy) seems to have increased over time for the taluks which were at the lower end of the distribution (10-20 per cent class) in 1971, and consistently fallen in the 50-60 per cent group. In other categories, variations in overall as well as female literacy rates seem to have increased in 1981, before falling. The extent of reduction in intra-cluster variability between 1971 and 1991 is rather small in several categories.

Table 5 classifies the taluks by the level of literacy in 1971 and the change during the subsequent two decades.

The overall literacy rate in Tamil Nadu in the base year was reported to be 39.5 per cent. On this basis, we have grouped taluks into four strata in terms of literacy levels in 1971 as follows:

10-20 per cent: very low
20-35 per cent: low
35-45 per cent: medium
45 per cent + : high

Again, the mean increase in percentage points of overall literacy across all taluks happens to be:

1971-81 6.3
1981-91 8.5
1971-91 14.8

Based upon these averages, we characterise, somewhat arbitrarily, change during 1971-81 and 1981-91 in the following way:

1971-81 Period
low : <5.6
medium : 5.7-6.6
high : >6.6

1981-91 Period
low : <7.7
medium : 7.8-8.8
high : >8.8

1971-91 Period
low : <13.0
medium : 13.1-15.0
high : >15.0

In all the above cases, our aim has been to put the various means roughly at the mid-points of the medium range.

The exercise yields a 12-fold classification of taluks, capturing the interesting and complex relationship between the original position of taluks (base year level of literacy) and their pace of progress in literacy.

Inter-decadal variations exemplify several patterns of change across taluks. For example, some taluks have sustained their forward march along the road of literacy throughout the entire period under study; some other taluks have progressed fast during 1971-81, losing the momentum in the next decade. Others have had a reverse experience, that is to say, they have effected a less than satisfactory growth in the 1971-81 period but have picked up the tempo of expanding literacy in the following decade. There are still a handful of taluks which have been sadly tottering behind the rest, featuring a low rate of change over the entire time interval considered (Table 6).

The good news is that the majority of the taluks (54 per cent) with low level of literacy in the base year have recorded high change (Table 5) in the 1971-91 period; while about 29 per cent of the remainder has featured moderate change. The disturbing news is that 16 per cent of the low-literacy taluks has continued to remain in the 'low-level low-change' trap.

Special attention needs to be devoted to these taluks that fall in the 'low-level low-change' category. On the one hand, we will be forced to investigate the factors—socio-economic and facility variables—that continue to prevent these taluks from overcoming their initial educational backwardness. On the more optimistic side, we expect to draw some useful insights from the experience of those taluks that have covered a significant ground, that is to say, having started from a low level they have overcome their initial disadvantage to a noticeable extent (by effecting a high rate of change). Such analysis, we hope, will throw light on the factors—socio-economic, political or policy interventions—that have facilitated their significant achievements. Similarly, attention needs also to be paid to those cases that have already been at a comfortable level of

TABLE 6: TWO IMPORTANT GROUPS OF TALUKS—STANDING STILL OR MARCHING FORWARD
(Overall Rural Literacy in 1971-1991)

literacy yet maintained their educational drive unabated by recording a reasonable amount of change

SOME INTERESTING ASSOCIATIONS

Annex Tables 1, 2 and 3[3] give the talukwise data on literacy and some of the related socio-economic characteristics for the three census years A simple correlation type analysis using figures grouped from the above set (Table 7) of the taluk level statistics suggests, for example, the following

(a) In all years, as we move from taluks with low to high overall literacy, the overall rural worker participation rate declines (this tendency is more pronounced in 1981 than in 1971 or 1991),

(b) In 1981 (the only year for which the taluk level irrigation data were readily available) there seems to be a positive association between mean literacy levels and the irrigation ratio as well as the proportion of workers in non-agricultural activities (the latter relationship holds for all the years)

(c) There is no significant association with land-man ratio or with the proportion of SC/ST in the total rural population However, it is noteworthy that the taluks which have attained 50 per cent (and above) overall rural literacy appear to have noticeably low proportion of SC/ST in the rural population

The above observations are based on grouped data However, since within each cluster of taluks (classified by literacy levels) there is a dispersion around the central tendency of each of the characteristics, it is necessary to undertake much more disaggregated analysis of the observed tendencies

In Table 8 we plot the various permutations and combinations of 'Levels and Changes in the Levels' of literacy in all the taluks and then enumerate changes in few other relevant variables. The purpose is to ascertain whether any significant relation exists between these concomitant changes

From the results reported in Table 8, the associations between the aforementioned changes do not seem to be obvious However, two important trends seem worth noticing First, within the group of low-literacy taluks (in 1971), the rate of increase in overall rural literacy appears to be negatively related to increases in SC/ST and Main Worker proportions That is to say, the taluks (in this category) recording higher rates of literacy increase have also registered lower increase in SC/ST and Main Worker population. Second, this pattern holds, though in a less pronounced manner, for the medium-literacy taluks also

Surely, the observed correlations are only indicative of the type of relations one might explore with this data set It is necessary to systematically spell out hypothesis regarding the various socio-economic characteristics and their role in determining supply of or demand for education in order to permit more sophisticated analysis of this body of data on the basis of well-developed hypothesis of causal relations. Secondly, in order to capture the true relation between socio-economic variables and literacy, we might have to lag the

former set of variables, since the former characteristics might have been different when the current literates have actually gone for schooling.

III

Facilities and Performance: A Village-Based Tale of Two Districts

In this section, we engage in a deeper probing into the domain of villages in the districts of North Arcot and South Arcot. As in the case of taluks, the village level data for the two districts (Table 9) for the year 1981 also suggest that, on the average, villages with higher literacy tend to have a higher irrigation ratio and higher proportion of people in non-agricultural activities. Also, while the disaggregated data seem to suggest positive association between land-man ratio and literacy rates, the relation between literacy on the one hand and worker participation rate and proportion of SC/ST in the total population on the other show more complex pattern. Admittedly, the analysis of village-based figures is far from complete. Indeed, a village-centred study of changes in literacy status as well as in the associated characteristics (of the kind done here at the taluk level) will be of great importance.

Furthermore, we need to use more extensively the information on supply-side factors presented in census reports. As a quick but necessarily incomplete illustration, here we utilise village-level information (for the year 1981) pertaining to school facilities in the selected districts and then try to trace their effects on the literacy records of villages.

In Table 10 we delineate the distribution of villages in terms of availability of educational facilities within village. In both North Arcot and South Arcot districts, comparatively smaller villages have lesser facilities. Precisely put, a large proportion of villages in the size class of less than 500 have no educational institutions within the village (34 per cent and 36 per cent for North Arcot and South Arcot districts respectively).

It perhaps needs mention here that having a primary school within the village is not enough to ensure enrolment at the elementary level. Indeed, a plausible argument is that non-availability of a middle school within village may depress enrolment even at the primary level. We find that a negligible proportion of small villages have middle or high schools within the village boundary (2.7 per cent and 6.3 per cent for North Arcot and South Arcot districts respectively).

In general, the availability of middle or higher level schools increases with an increase in the village size. While this pattern holds for both North Arcot and South Arcot, quite intriguingly in South Arcot district (which incidentally has a lower overall rural literacy level than North Arcot in 1981—32.16 per cent and 36.14 per cent respectively), smaller villages are better endowed with educational institutions than their North Arcot counterparts. The picture is, however, somewhat different between the two districts in the larger sized villages.

How are these villages endowed with different school facilities faring in terms of their literacy status? A brief summary of literacy records of villages, cross-classified by village size and educational facilities can be found in Tables 11 and 12. Several interesting features draw our attention here. First, size of the village, by itself, does not seem to determine either the level of overall literacy or that of male and female literacy. When the level of educational institutions is controlled, neither overall, nor male, female literacy rates record a noticeable or systematic change across different size classes of villages.

Second, and more interestingly perhaps, accessible educational facilities appear to have a positive relationship with literacy performance. That is to say, within each size class of villages (with a handful of exceptions), the literacy achievements of villages with primary school are better than those with no school at all (in terms of all literacy indicators considered here) and the similar records of villages with middle or higher level institutions are even more impressive than those having primary schools alone. This is true for both North Arcot and South Arcot districts.

Additionally, gender disparity in literacy (measured here through male-female

literacy ratio) is also much higher in the villages (again within each size category) with nil of inadequate educational facilities than in their better endowed counterparts Clearly, accessible facilities make a difference in terms of educational performance, in particular for girls Put simply, higher the access to facilities, better the literacy performance and lesser the sex disparity

We, however, hasten to add that these observed associations are only suggestive of possible causal relations among factors which remain to be properly tested For example, to mention once more, better educational access in the smaller villages of South Arcot notwithstanding, their literacy records are less impressive than their North Arcot counterparts The complementary as well as conflicting relationships between facilities and performance define the complexity of the problem. Thus, our findings here are more suggestive than definitive; they are modest in that they simply raise some important questions without answering them

In the above exercise, we have sought to capture a glimpse of the complex pattern that exists between educational performance and other relevant features. A lot of ground can be gained by undertaking similar kinds of analysis on a larger scale

IV
Conclusions

It is evident that available secondary sources provide a wealth of data on spatial and temporal variations in educational levels and progress Mapping of variations in these respects provides a basis for assessing the

existence of any systematic patterns as well as the association between various indicators of educational performance and socio-economic factors which affect the demand for and the supply of educational facilities.

As we have seen, some of the relevant socio-economic characteristics, influencing demand, for example, include: per capita income and its distribution, land-man ratio, per cent of irrigated land, proportion of SC/ST in the total population, per cent of non-agricultural employment, extent of work involved in collection of water, fuel and child care. On the supply side, school facility characteristics (indicating both the volume and quality of services) such as distance to the nearest school, incidence of single-teacher, single-room schools, per cent of trained teachers constitute relevant focus variables.

Some information on these factors is available and can be used more extensively. Exploiting the available information will not only provide useful insights, it would help more effective use of limited resources for fresh surveys by limiting such enquiries to those aspects which are not covered (or are poorly covered) by existing sources. It would also help in developing typologies of districts/taluks/villages (based, for example, on the initial levels of achievement and the pace of progress in the last 20 to 30 years). Micro studies planned on the basis of such typologies can then be used to speak meaningfully about macro trends.

Notes

[This paper has been prepared as a background document for a national project on 'Access to and Financing of Elementary Education' as part of a larger project entitled 'Strategies and Financing for Human Development' sponsored by the United Nations Development Programme (UNDP). A brief summary of the paper has been published in the *Bulletin*, Madras Institute of Development Studies,n 1994. The authors gratefully acknowledge P Anbazhagan's major assistance in the data analysis.]

1 Scheduled Caste and Scheduled Tribe Literacy statistics are available up to taluk level; in this paper, however, we have not utilised this information.

2 However, one disconcerting factor is the standing of the taluks *vis-a-vis* the state overall literacy average. Despite the improvement in the rural literacy scene over time, the rural literacy rate in a large number of taluks falls below the state average. Whether urban literacy has primarily pushed the state average up is clearly an issue for further investigation.

3 These tables will be available to readers upon request.

Urban Informal Sector and Communal Violence

Case Study of 1992 Riots in Calcutta

Ishita Mukhopadhyay

This snap-shot study of the impact of the post-Ayodhya riots on the informal sector in Calcutta reveals that the more stable formal sector tended to ensure its economic security by dumping goods and other consumables in the informal sector with which it had linkages. As a result the latter sector suffered a worse economic loss.

THIS study focuses on workers employed in the urban informal sector as victims of communal violence. The victims in such cases have always been the poor in the society. The study looks at the impact of riots on the informal sector as this sector hosts a majority of the urban poor. The field is the informal sector of Calcutta, and effect of the post-Ayodhya riots, 1992, has been studied. The snap-shot study reveals an acute impact on the whole of the informal sector and a differential impact on the various categories of it.

I

The specific purpose of the study is to look into the economic factors precipitating social crimes such as communal violence. As Calcutta is a major city with highest population density,[1] it has a huge informal sector. 'Informal sector' has been defined here as the unorganised sector which is outside the periphery of full labour enactments.[2] Generally, the boundary of this sector is obtained by the standard exclusion principle—what is not covered by the sphere of formal sector is informal sector. The sector includes petty self-employed units, small units of factory production, employing seven to 10 persons, shops and other establishments. The entire sector is a heterogeneous mix. The workers here are not protected by labour legislation rules. The sector, thus, may include a segment of the rich also. However, for the purpose of present study we have ignored that segment. We have considered only the poor within the sector.

The informal sector has been a primary target of attack in the post-1986 urban riots. Even the December 1992 riots in Calcutta were concentrated in areas where the vast majority of the poor is engaged in informal sector activities. However, what has been observed in Calcutta can hardly be generalised for the entire country. West Bengal is a centre of strong leftist movements, with a stable regime of the Left Front for 17 years. The state is also known for communal harmony. There exist strong resistance movements against communal violence. These blunt the sharp effects of communal violence observed elsewhere. However, neither Calcutta nor the state of West Bengal can remain isolated from the mainstream of socio-economic currents operating in the country whatever be the political will of the state government or of the people. There was a series of the post-December 6 communal riots in the country. As these riots affected the poor, the direction, if not the magnitude, of the impact observed in Calcutta has resemblance with that in the rest of the country.

The paper starts with a brief survey of the economic factors conditioning the post-1986 communal riots in the country, and an introduction to Calcutta's informal sector. Then we pass on to the main findings of the study.

II

The communal violence that broke out in India in the wake of December 6, 1992 was the culmination of a series of events starting from 1986. The nature of the post-1986 communal violence has been different as compared to the one before this period. One of its characteristics has been pre-planned attacks on people engaged in urban informal industrial sector. Observers of the post-1986 riots in Meerut, Moradabad, Ahmedabad, Aligarh, Delhi and Hyderabad [Engineer 1984, 1987, 1990, 1992] reveal that there were attacks on petty producers, shops and such other establishments. In the case of Maharashtra, riots were concentrated in the areas inhabited by hawkers, vendors, petty shopkeepers, and even construction labour. The cause of the violence there, as identified by Guru (1993), was large-scale migration to Bombay and mushrooming of slums. Studies on Surat riots [Chandra 1993; Sheth 1993; Lobo and D'Souza 1993] show that there was a continuous increase of workers in marginal industries in the decade preceding the phenomenon. Victims included cart-drivers, loom-operators and other similar workers engaged in the informal sector. A study on gender and communal riots [Mehta and Shah 1992] covering Baroda reached the same conclusion. According to this study, the people most affected by riots included footwear sellers, 'badala' embroidery workers and the like. The studies point out that informalisation of production in urban industrial areas has been a dominant precipitating factor behind communal violence in cities.

III

The vast, heterogeneous stretch of the rapidly growing informal sector in Calcutta has been an area of investigation for many researchers.[3] Hence the field of the present study is an already well-identified and well-located one. A report prepared by Bose (1974)

serves as a starting point for any extensive work on informal sector in Calcutta Other studies include those by Banerjee (1990), Mukherjee and Racine (1990) and Romatet (1990) West Bengal State Planning Board made an extensive and intensive survey on the sector in 1990 These, along with some studies on the informal sector in third world countries[4] [Sethuraman 1977, Bromley 1978a, 1978b, etc] hint at the general characteristics of this sector

The studies broadly indicate that there exist two categories of the informal sector in Calcutta, as in the other cities of the third world One type corresponds to the section which is attached or tied to the formal sector by a putting-out arrangement The other type is the residual that is unattached to the formal sector This consists of self-employed units, having an independent production system One of the striking features of the industrial sector in Calcutta is the large number of backyard workshops that have grown around formal sector firms The formal sector firms subcontract to the small workshops who are able to produce and sell more cheaply than the formal sector sources of supply This is evident in the case of footwear production, tailoring and other activities This category of informal sector is tied to the formal sector However, there also exists a sizeable volume of employment in the other category This includes shopowners and individuals selling goods, sellers of personal and domestic services transport operatives, repair personnel, craftsmen, professionals and others This category is unattached to the formal sector

From the existence of these two categories it is obvious that there is an element of complementarity between the formal and the informal sector Often the formal sector maintains its own stability at the expense of the tied appendage of the informal sector As this latter category of the informal sector lies at the tail-end of the production process, exploitation here is the greatest This additional dimension of exploitation is missing in the case of the other category of the informal sector, although deprivation and impoverishment exist The paper examines whether there was a differential impact of communal violence on the two categories along with the general impact

IV

The present study took the detailed information of the informal sector in the city of Calcutta Metropolitan Area (CMA) from the study conducted by the State Planning Board (1990)[5] We selected directly, and indirectly riot-hit areas from amongst the areas of the concentration of the informal sector As mentioned earlier, riot-hit areas generally coincided with the areas of the concentration of the informal sector Areas of the concentration of the informal sector are Dumdum, Beliaghata, Bhowanipore, Bahgajatin and Behala [Survey 1990] Directly riot-hit areas were Beliaghata and Metiaburuz[6] Indirectly riot-hit areas were Dumdum, Bhowanipore, Bahgajatin and Behala Samples were structured, in the sense that they were drawn from both of these two types of areas Chosen sub-areas under directly riot-hit areas were Dhobiatalao, Meher Ali Lane and Mir Meher Ali Lane in Beliaghata and Kashyappara in Metiaburuz Chosen sub-areas under indirectly affected zones were along B T Road in Dumdum and Chakraberia in Bhowanipore

Directly, riot-hit areas were areas of direct communal violence and attack, whereas indirectly riot-hit areas did not witness any direct communal violence, but were victims of long drawn curfew hours and rumours regarding violence in other parts of the city

The total sample size in the two categories of city areas was 383. The size of the samples

drawn from the respective areas was: Meher Ali Lane (D): 97; Mir Meher Ali Lane (D): 82; Dhobiatalao (D): 77; Akra Road (D): 26; Chakraberia (I): 46; and B T Road (I): 55. (The brackets indicate the category of the city areas—D for directly hit, and I for indirectly hit.)

The survey was conducted by addressing questions to the affected persons in the chosen areas. The specific technique that was used to generate information was primarily structured questionnaires. However, these were supplemented with many open-ended questions or non-structured questionnaires.

The objective was to assess the nature and extent of economic loss of the victims. The victims were classified into owner-employers, self-employed and workers in the two varieties of areas. Questions were addressed to the workers to check the opinions offered by the owner-employers. To gather information regarding economic loss of the victims, data relating to average monthly income was sought to be gathered. Treating this as imputed income (I), monetary loss (R) to the riot-affected individuals, reported by themselves, was expressed in terms of the imputed income. The index (R/I = V) in percentage terms was then taken as an index of 'loss of economic viability' of the individuals. With this index, it was possible to categorise the incidence of economic loss that was experienced by the victims in the two areas (D and I). The cases where V > 100 per cent, the monetary loss exceeded income. Hence the victim is said to suffer from an absolute amount of capital loss. This capital loss is mainly in the form of loss of machinery and other capital goods. When victims suffer capital loss, we say that the victim has entered into a zone of long-term non-viability in terms of productive capacity. Thus higher the index, greater is the degree of loss of economic viability of the individual unit.

From the set that comprises the informal sector, from which the sample space is generated, we identified two subsets: Type I and Type II. Type I is the portion of the informal sector attached to the formal sector in a putting-out arrangement. Type II is the set of isolated, individual, self-employed units unattached to the formal sector. The effect of communal riot has been analysed with respect to differential impact upon these two categories.

The data compiled from the structured and non-structured questionnaires were pooled to obtain the estimated V. V was computed for the different areas with respect to individuals belonging to different occupations. The data was arranged separately for each area due to the peculiarity of the phenomena in the different areas.

Three kinds of tables (A, B and C) are constructed for each of the four directly affected areas. Type A tables arrange the data of V with respect to different occupations. Four ranges of V are considered V <= 100; 100 < V <= 1000; 1000 < V <= 2000; V > 2000. The number of victims with respect to each occupation is then arranged by fitting the individuals into the separate ranges of V. It has already been mentioned in preceding paras that as V increases, more is the capital loss incurred and, hence, more non-viable the informal unit becomes. Type B tables rank the occupations according to the average degree of non-viability. Higher the rank, greater is the non-viability of the unit. Type C tables pool the average V for the two categories of informal sector, Type I and Type II. The three types of table do not appear for the indirectly affected areas as for all units belonging to these areas V <= 100. Thus for the indirectly affected areas, data of average V for the different occupations are given in two separate tables for each of the two areas. In these tables also, the different occupations are ranked according to V. Higher the rank, larger is V. The findings of each area are discussed below.

Findings

Meher Ali Lane located in ward no 57 consists mostly of workers engaged in scrap plastic, scrap rubber, cutting of rubber materials. The wage payment of workers are on a daily basis.

In Table 1(A), we observe that with respect to all occupations, V lies between 100 and 1000. With respect to workers in waste battery, waste paper, vendors, vehicle puller, the entire set of sample observations fall in this zone. Among those engaged in scrap plastic units, rubber cutters, shop owners and others engaged in odd jobs, most of the sample observations again fall in this zone. This is also confirmed by Table 1(B) where we find that majority of occupations suffer a loss of economic viability with 100 < V <= 1000. A shop owner and another engaged in other jobs suffered the least loss of economic viability. From the non-structured part of the questionnaire we know that the shop owner was saved by accident and the particular individual engaged in other occupations was a barber, who had only his box of tools as capital good. Hence he had nothing to loose. Those who suffered the greatest loss of viability were three scrap plastic men, two strap moulders and four engaged in other occupations.

Table 1(C) assigns the type to each occupations. Scrap plastic, scrap rubber, strap moulding, strap cutter, a few shop owners, waste battery and vendors all belong to Type I. However other shop owners, waste paper, vehicle pullers and others belong Type II. As the Type I units are attached to the formal sector, they have avoided the risk of the riot and has shifted to the informal sector units the uncertainty of loot and plunder. This was true for most of the vendors who were fruit sellers. As soon as the news of demolition of the mosque on December 6 spread, fruits were dumped on to fruit sellers by retailers. They badly suffered with V nearing 1000 as the entire stock was looted. This was also true for other units belonging to Type I category. Thus average V for Type I exceeding the average V for Type II.

Mir Meher Ali Lane comprises ward no 57. Most of the informal sector workers were engaged in the business of scrap materials. The payment is made on a daily basis. Mir Meher Ali Lane also duplicates the findings of Meher Ali Lane. We find a concentration of sample observations of Type V in the region where 100 < V <= 1000. With the exception of three strap cutters, three shop owners and five individuals engaged in other occupations, the entire set of sample observations fall in that region. Table 2(B) also confirms this result. Table 2(C) arranges the data into Type I and Type II categories. This again reveals that average V for Type I is higher than average for Type II. From the non-structured part of the questionnaire we find houses were burnt, products of the productive units were burnt and looted, cycles, machinery, tools and implements were either burnt or looted in the entire area.

In Dhobiatalao area we find more or less scattered arrangement of V with respect to different occupations. Here also we find a concentration of sample observations in the zone where 100 < V <= 1000. Among those who worked in scrap plastic units, most incurred a massive loss of economic viability with nine units registering V > 2000 and 9 registering V in the range 1000 < V <= 2000. This is again a Type I informal sector, that is, it is attached to a formal sector and the formal sector has shielded itself from the uncertainty by dumping goods in the informal units. Here also we find a solitary shop owner who was accidentally saved.

In Mir Meher Ali Lane and Dhobiatalao almost all units suffered a positive loss of economic viability in the sense that V > 100.

In Akra Road, most of the units were tailoring shops, small stationery stores, etc. Table 4(A) reveals that most of these suffered loss of economic viability with V > 2000. The entire set of shops were rendered non-viable. Again as the tailoring units work on a putting-out arrangements with the formal sector, we find the phenomena of the dumping of commodities and raw materials, just before the riot. This was evident from the answers received from the non-structured part of the questionnaires. Table 4(B) and 4(C) also corroborate the same.

We find a marked difference in the effect of the riot on the indirectly affected areas. In both the areas—Chakraberia and B T Road, we find V for each unit to be much less than 100. In these areas the loss of affected population consisted of human-hour losses caused by long curfew hours. The loss was not of long-term economic viability. The affected persons in the directly hit areas suffered a loss of long-term economic viability due to loot and arson of the machines.

We also find a difference between the directly affected and indirectly affected areas in respect of number of days lost by the workers. Table 7 gives the average number of days the workers could not attend to their jobs in the two distinct areas. The higher average in case of directly affected areas is due to the massive loss of long-term economic viability of productive units. But in case of the indirectly affected areas the loss of human hour was only due to the curfew hours.

The differential impact of the communal violence upon directly and indirectly affected areas only point to the fact that the riot was not allowed to spread beyond the areas of initial attack. This means that the riot was sporadic. The second feature brought out by the study is the differential impact of the riot among the affected population in the informal sector itself. The part of the informal sector that is tied to the formal sector suffered a greater loss of economic viability than the independent units. This is due to the fact that formal sector units have maintained their own stability by using these poor sectors as dumping grounds. Thus these units were rendered non-viable. The self-employed category or Type II also suffered a tremendous loss, but the degree is much less. Hence the study shows that riots are manifestations of attack on poor by vested interests and are never free of class-biase.

Notes

[The author is indebted towards the post graduate students of Department of Economics Calcutta University for assisting in research and field work. Amitabha Sengupta, Sujoy Bhattacharya, Sabyasachi Basu, Sunetra Sengupta, Pinaki Gupta, Debalina Roychowdhury Kumarjit Mondal, Arindam Mani Suman Ghosh Rajendra Narayan Nag Nupur Nag formed the team of field surveyors who worked intensively to make the project a success. Rajendra Narayan Nag and Kumarjit Mondal helped the author in conceptualisation of the problem. Sabyasachi Basu and Sunetra Sengupta gave valuable computer assistance. Nita Mitra's comments were useful. The author is indebted to all of them without whose help the study would not have been completed. I am also indebted to the Centre for Urban Economic Studies, Department of Economics Calcutta University for sponsoring the project. However, only the author herself is responsible for the errors.]

1 Population density of Calcutta is 88,135 per sq km, *Human Development Report* 1992.

2 See Bromley, R (1978a) and Sethuraman S V (1977).

3 The events in Russia as well as in many European countries prove that ethnic clashes are rampant.

4 The earliest sample survey of informal sector enterprises in the bustees of Calcutta and Howrah was carried out during the summer of 1973 by Calcutta Urban Services Consortium.

5 Studies on informal sector in Africa, Daker, Freetown, Colombia, Lagos, etc. exist. A seminar was held from March 27 to April 12, 1977 in Accra, Ghana where constraints faced by this sector were pointed out and discussed.

6 Survey (1990).

7 The area 'Metiaburuz', was not covered in any of the earlier surveys. However in Metiaburuz also, we have a concentration of informal sector.

Spatial Dimension of Acceleration of Economic Growth in India

Ravindra H Dholakia

This study of 20 state economies of India over the period 1960-61 to 1989-90 reveals that the phenomenon of acceleration in economic growth is spatially dispersed and covers about two-thirds of the national economy. The study also finds that most of the states experiencing growth acceleration are relatively less well off. There are marked tendencies for convergence of long-term economic growth rate among Indian states. The growth experience and development strategies differ significantly among states. The leading states also show different patterns of growth. In the Indian industrial sector, the existence of a sharp north-south divide is further corroborated.

I
Introduction

INDIA has experienced marked acceleration in economic growth around the late 70s and early 80s. A sharp increase in the long-term growth rate of real domestic product from less than 3.5 per cent in the earlier period to more than 5 per cent in the later period is reported in several studies [e g, Nagraj 1990 and 1991; Bhargava and Joshi 1990; Ganesh 1992; etc]. Ganesh (1992) has examined the sectoral dimension of such acceleration in India's growth rate. He considered the standard three sector classification of the primary, secondary and tertiary sectors. Goldar and Seth (1989) considered spatial variations in the growth of the registered manufacturing sector of 12 major state economies. Their findings reveal considerable variation in the growth experience of state economies in India. They also traced the deceleration in industrial growth after the mid-60s and the recovery after the mid-70s to the intertemporal variations in industrial growth experienced by five state economies of Bihar, West Bengal, Orissa, Rajasthan and Uttar Pradesh which account for about one-third of India's registered manufacturing sector. However, there is hardly any effort to address the question of identifying the regions which might have triggered the acceleration in overall growth. It would also be informative and important to examine whether the acceleration in the Indian growth rate is on account of the economically better off states or economically poorer states. Similarly, it needs to be investigated whether the phenomenon of acceleration is confined only to a small geographical region or covers a large region; whether it is concentrated in some specific parts of the country or is geographically widespread. In the present paper, an attempt is made to investigate these questions.

The next section is devoted to the discussion of the methodology followed and data used in the present study. In the third section, we examine the question of the regional spread of the phenomenon of acceleration of the overall growth of real domestic product in India. The question of identifying the state economies which might have led the acceleration in the Indian growth rate is investigated in the fourth section. There we also examine the behaviour of growth paths of individual state economies in the primary, secondary and tertiary sectors separately. The fifth section is devoted to the discussion of growth experience of the lagging state economies. The sixth and final section summarises the main findings of the study.

II
Methodology and Data

Methodologically there are two distinct questions which one can address: (a) To establish that the time trend has shifted from a given year. It involves dividing the time series into sub-periods with the given year as a dividing line and establishing that the trend rates of growth in the two sub-periods differ significantly. In this case, the given year or the dividing line is chosen exogenously of the data set. Generally, in practice, it is chosen quite arbitrarily. (b) The other question is to identify the exact year in which the time-trend has shifted, if at all. In this case, the year of shift in the trend is treated endogenously and the year is identified with the help of the given time series data only. In the case of India, most of the studies investigating the acceleration in the growth rate have addressed the first question of establishing whether India experienced a shift in her time-trend during the exogenously chosen year which differed from study to study. [See, Nagraj 1990 and 1991; Bhargava and Joshi 1990; Goldar and Seth 1989; etc.] Only Ganesh (1992) attempted the second question of identifying the year of shift in the time trend from the given time series data.

The standard methodology adopted to address the question (a) of establishing a shift in the trend during the chosen year is to fit a kinked trend line with the kink occurring at the chosen year. This is accomplished by fitting the following regression equation [Gujarati 1988, p455]:

$$\text{(1)}\quad \ln Y_t = a + bt + c\,(t-t^*)\,D + u_t$$

where Ln Yt represents natural logarithm of income (or dependent variable) in the year t, t^* is the chosen year of shift in the trend, D is the dummy variable which takes value 1 for years after t^* and zero otherwise, u_t is the error term, and a,b and c are coefficients to be estimated. The coefficient b represents the growth rate and the coefficient c can be interpreted as the magnitude of the shift in the growth rate after the chosen year t^*. The statistical significance of the coefficient c would, thus, establish whether the time trend shifted during the chosen year. The sign and value of c would establish respectively the direction and magnitude of the shift if found statistically significant.

In order to investigate question (b) of identifying the year of shift, the usual procedure would be to apply the switching regression technique and then carry out the test suggested by Quandt (1958). Ganesh (1992) followed the same procedure but following Moschos (1989), applied a test equivalent to the one suggested by Quandt (1958). The whole procedure consists of estimating regression equation (1) given above separately for alternative values of t^* around the likely point of shift in the trend. The most appropriate year of break is then identified as the optimal value of t^* for which the corresponding regression has maximum r-square [Silber 1974] or has maximum t-value of the coefficient c in the abovementioned equation (1) [Moschos 1989]. We have used the same procedure with switching regression technique but after correcting for the first order autocorrelation through Cochrane-Orcutt

iterative method. [For details, see Gujarati 1988, pp 383-84.]

While considering the regional aspects of growth acceleration, it may be of interest to establish whether state economies also experienced the shift in their growth path during the same year in which the nation as a whole experienced the acceleration in the growth. This exercise which is carried out in the following section, would help to examine the geographical spread of the phenomenon of growth acceleration. Obviously, one does not expect that the phenomenon would be spread over all the state economies in the country. By establishing the regions experiencing the growth acceleration simultaneously with the national economy, it would be possible to test the hypotheses about the proportion of the economy, the geographical concentration in the economy, and the nature of the state economies (rich or poor) experiencing the phenomenon of growth acceleration. However, in order to identify the state economies, or a part thereof, which triggered forces ultimately leading to the growth acceleration of the national economy, we have to identify the years of break of time trend in different sectors of each economy. By considering the sequencing of the optimal time points showing the break in the time trend of different sectoral incomes in different states, valuable insights in the process of growth acceleration of the national economy can be gained. Both these exercises have been carried out and the results are discussed in the following two sections.

The basic data used in the present study are obtained from the various volumes of the CSO publication on *Estimates of State Domestic Product*. It is possible to get a comparable set of reasonably long time series of data on SDP for 20 state economies in India. These 20 states are mentioned in the first column of all the tables given here. The concept of SDP used in the present study is a net domestic product concept and is based on income originating in the state rather than income accruing to the state. The three-sector classification is also considered in the study. The primary sector consists of agriculture and allied activities, fishery, forestry, and mining and quarrying sub-sectors. The secondary sector includes manufacturing, construction, and electricity, gas and water supply. The tertiary sector comprises the rest of the sub-sectors. The CSO publications on SDP do not provide data on SDP at uniform constant price figures for a given state over the whole period from 1960-61 to 1989-90. In order to have a consistent set of data on SDP and its sectoral break up for each of the state economies at 1980-81 constant prices, the usual procedure of linking the indices by changing the base of constant prices is followed. For Madhya Pradesh, however, the SDP estimates are at 1970-71 prices. Table 1 provides the basic information on the period for which SDP data are obtained for each state for the present study.

III
Regional Spread of Acceleration of Growth

Ganesh (1992) has identified the year 1981-82 as the most appropriate year of break in the time trend of real income in the Indian economy. His finding is based on a long time series of gross domestic product (GDP) at 1980-81 prices from the year 1950-51 to 1989-90. In order to examine the question of regional spread of the phenomenon of acceleration in the overall growth of real income in India, therefore, the year 1981-82 may be considered as the given point of break in the trend rate of growth for each of the state economies. Following the kinked trend line (equation 1) method described in the previous section, it is possible to estimate the regression with the help of overall real SDP for every state economy. The results are reported in Table 2.

The results reported in Table 2 indicate that the kinked trend line equation fits very well to the state level real SDP series. The goodness of the fit revealed by the r-square statistic is excellent in the case of every state economy without exception. Similarly, the basic trend rate of growth (coefficient b in the equation 1 above) is also statistically highly significant in all the 20 state economies. It is only the shift parameter c of equation (1) above indicating the extent of acceleration or deceleration that turns out to be statistically significant only in a few state economies. In as many as 14 out of the 20 state economies, the shift parameter does not turn out to be statistically significant even at 10 per cent level of significance. Thus, the phenomenon of the break in the trend rate of growth observed for the Indian economy in the year 1981-82 is not evenly spread regionally but has occurred only in some parts. The states where clear acceleration in the growth is established in the year 1981-82 are Karnataka (1.14 per cent), Madhya Pradesh (3.68 per cent), Maharashtra (1.74 per cent), Tripura (1.70 per cent), Uttar Pradesh (2.61 per cent), and West Bengal (2.17 per cent). Bihar (1.67 per cent) and Assam (1.87 per cent) also experienced acceleration in their trend rate of growth but the level of statistical significance of the shift parameter is somewhat less satisfactory in their cases, though with more than 85 per cent level of confidence one may conclude about the positive shift in their time trend during 1981-82. All these states except Karnataka experienced the acceleration in their growth rate at a rate well above the one experienced by the Indian economy (1.63 per cent). This is not surprising because a large number of states did not experience any shift in their trend rate of growth during 1981-82. Hence the national average gets pulled down as compared to the states where the shift in the trend can be established during 1981-82.

Once it is accepted that the phenomenon of growth acceleration from 1981-82 can be established only in six to eight states out of 20 state economies in India, it is interesting to examine the characteristics of those six to eight state economies. Firstly, it is worth noting that these states are geographically spread and cover a large area. In terms of the zones, these states cover all the five zones, viz, north, east, west, south and central. Secondly, most of these state economies are large in terms of population, geographical area, employment and income. They in aggregate, account for approximately 60 to 70 per cent share in the Indian economy. Thus, although the phenomenon of growth acceleration from 1981-82 in the Indian economy was not evenly spread geographically, it is reasonably widespread. Thirdly, all these states except Maharashtra are not economically very well off as compared to the national average. In fact, Bihar, Madhya Pradesh and Uttar Pradesh are among the poorest states in terms of per capita income in the country. Moreover,

TABLE 1. TIME SERIES DATA ON SDP BY STATES CONSIDERED IN STUDY

States	Time Period	No of Observations
1		3
1 Andhra	(1960-61 to 1988-89)	29
2 Arunachal	(1970-71 to 1989-90)	20

these states had the basic trend rate of growth much below the national average of 3.52 per cent prior to 1981-82. The extent of acceleration experienced by these states in their growth rate is also phenomenal. The growth acceleration in the Indian economy seems to have been regionally more equitous ultimately.

Several of the lagging states have started growing relatively rapidly after 1981-82 as compared to the earlier phase. On the other hand, the states which grew rapidly during the period prior to 1981-82 have not experienced significant increase or decrease in their long-term growth rates. The inter-state variation in the long-term economic growth in India seems to have reduced considerably after 1981-82. The tendency for equality in the overall growth rate of incomes among states has interesting implications on factor efficiency and hence on factor rewards and resource allocation across states. Assuming that the richer states are saving and investing a greater proportion of their income than the poorer states, equality of their growth implies one of the following: (i) the incremental capital-output ratio (ICOR) is higher for the richer states and lower for the poorer states; or (ii) capital moves from the richer states to the poorer states. If capital flows from the richer to the poorer states, the labour migration in the reverse direction would reduce because more jobs would be created in the poorer states and less in the richer states. If, however, capital does not flow from the richer to the poorer states, the capital would be earning the same rate of return in the richer states as in the poorer states. But, then, higher ICOR in the richer states would imply a lower labour cost per unit of investment in the richer states than in the poorer states.* Thus, the richer states would be specialising in more capital-intensive commodities and the poorer states in more labour-intensive commodities. Such a pattern of growth would also check the labour migration from the poorer to the richer region because the relative factor prices would also tend to equalise among states. What is more important to note is that under such conditions of growth, the globalisation and liberalisation of the Indian economy would impose much higher burden and pain of structural adjustment and restructuring on the richer states as compared to the poorer states. It is quite possible that the poorer states would stand to gain significantly out of the opening up of the Indian economy. In order to examine detailed implications of the reduced inter-state variations in economic growth in India after the growth acceleration of the 80s, it is necessary to undertake an indepth inquiry relating to factor growth, factor incomes, technical progress and comparative advantage of state economies which is beyond the purview of the present study.

IV
Leaders of Growth Acceleration

In order to identify the year in which different state economies experienced a significant shift in the time trend of their income, the technique of switching regression described in the Section II above was followed. As noted there, all regressions were corrected for the first order autocorrelation by following the Cochrane-Orcutt interative procedures. If the shift parameter c turned out to be statistically

TABLE 2: ESTIMATES OF TREND RATE OF GROWTH AND SHIFT IN TREND FOR STATE ECONOMIES IN YEAR 1981-82

States 1	Trend Rate 2	Shift Parameter 3	R-Square 5
1 Andhra	3.13 (12.45)	0.87 (0.85)	0.9611

20 West Bengal	2.48 (19.50)	2.56 (4.11)	1982-83	0.9850
All India	3.52 (81.70)	1.63 (6.80)	1981-82	0.9971

Notes and *Sources* are the same as Table 2 above.

insignificantly different from zero even at 10 per cent level of significance in all the alternative regressions tried, the shift variable was dropped and the simple log-linear time trend equation was fitted. This exercise was carried out for incomes of all the 20 states in the three broad sectors and the total of all sectors. The results are reported in Tables 3 to 6.

Table 3 presents the optimal year of shift and the estimates of the basic trend rate of growth as well as the shift parameter for total real income (SDP) in all the 20 state economies and all India. It can be seen from the table that Arunachal Pradesh, Haryana, Punjab, Rajasthan and Tamil Nadu did not experience any significant shift in their time trend over the period under consideration (Table 1). Out of these, Arunachal Pradesh, Haryana and Punjab can be considered as 'high growth' states since their trend rate of growth is in excess of the basic growth rate of the Indian economy until 1981-82 (3.52 per cent) by more than 25 per cent of it. Out of the remaining 15 state economies which experienced significant shift in their time trend of income at some year during the period under consideration, as many as nine states turned from low or medium growth economies to the high growth economies. These states in the alphabetical order are: Assam, Gujarat, Himachal Pradesh, Karnataka, Madhya Pradesh, Maharashtra, Tripura, Uttar Pradesh, and West Bengal. Out of the remaining states, Andhra Pradesh and Bihar experienced significant acceleration during the late 60s to turn into medium growth states from low growth states. However after 1981-82, they have again slided down the relative scale since the national growth rate got accelerated too. Jammu and Kashmir and Kerala were medium growth states but experienced significant deceleration in their growth to become low growth state of late. Manipur and Orissa started off as high growth states but experienced considerable deceleration in their growth with the result that Orissa became medium growth and now a low growth state and Manipur turned into a medium growth state. Thus, growth experience differs considerably among states in India during the period under consideration.

Another important observation from Table 3 is that different state economies experienced shift in their time trend of income in different years spread over the whole time span under consideration. There is hardly any appreciable clustering of states in any year during the period experiencing shifts, particularly acceleration. This essentially captures the location and nature of growth impulses experienced over time in the Indian economy. Considerable gains in terms of higher growth with equity could be obtained by strategically concentrating efforts in the states like Kerala, Jammu and Kashmir, Manipur, Orissa, Rajasthan and Tamil Nadu. These states could be turned into high growth states with planned efforts.

The sequencing of the optimal years of shift experienced by different states as revealed by Table 3 suggests about the states which might have led the process that culminated into growth acceleration of the Indian economy during the 80s. As noted earlier, Arunachal Pradesh, Punjab and Haryana were already the high growth states and continued to be so throughout the period under consideration. The states which might have triggered the process of growth acceleration in the Indian economy are the ones which experienced significant acceleration in their growth rates to turn into high growth states. Maharashtra and Tripura were the first to experience such an acceleration in the year 1972-73, followed closely by Gujarat in 1973-74 and Uttar Pradesh in 1974-75. After a considerable lag, Assam and Madhya Pradesh also turned into high growth states in 1979-80. On margin, this would have tilted the balance (or the national average) also to shift to the high growth path. The roots of India's growth acceleration, however, can be traced to the growth experience of Maharashtra, Gujarat and Uttar Pradesh. It is interesting to note that all these three states experienced very different growth impulses. The forces responsible for their turning into high growth states from the medium or low growth states are also substantially different.

Sectoral growth paths and possible shifts therein in different state economies of India as reported in Tables 4 to 6 provide useful insights into their growth experience. It can be seen from these tables that Maharashtra, the first Indian state to turn into a high growth state in 1972-73 from a moderately growing state did not experience any shift in the growth path of either primary or secondary sector during the entire period under consideration. The shift in the growth path of the tertiary sector in Maharashtra came as late as 1984-85. This apparently puzzling case can be resolved if we consider the magnitude of the long-term growth rates of Maharashtra's three sectors. Maharashtra's primary sector grew at less than half the rates of its secondary and tertiary sectors. Significant structural changes in the economy would have, therefore, led Maharashtra to turn into a high growth economy around 1972-73. Once the economy settled down, again it would become a moderately growing economy as compared to the national average. However, in 1984-85, it experienced a major shift in its tertiary sector growth. If it is due to increased activities on infrastructural front, the secondary sector would experience a shift in its growth path in subsequent years. It was not possible to verify this because our series is only up to 1989-90.

The experience of Gujarat, another important state to trigger acceleration in the economy is very different from Maharashtra's. Gujarat turned into a high

TABLE 4 ESTIMATES OF TREND RATES OF GROWTH AND POSSIBLE SHIFTS IN PRIMARY SECTOR OF INDIAN STATES

States 1	Trend Rate 2	Shift Parameter 3	Optimal Year of Shift 4	R Square 5
1 Andhra	1.88 (8.18)	–	–	0.7717
2 Arunachal	4.52 (11.42)	3.94 (5.91)	1979-80	0.9853

18 Tripura	2.65 (21.85)	–	–	0.9302
19 UP	1.34 (3.52)	1.68 (2.76)	1973-74	0.8812
20 West Bengal	2.28 (14.98)	5.02 (5.12)	1982-83	0.9473
All India	2.22 (25.54)	0.86 (2.39)	1979-80	0.9757

Notes and *Sources* are the same as Table 2 above.

growth state in 1973-74 when its tertiary sector experienced a sharp increase of 3.11 percentage points in its growth. In the following year its secondary sector experienced a substantial rise in the growth by 3.05 percentage points to firmly put the state economy on the accelerated growth path. It is well known that Gujarat emphasised the strategy of physical infrastructural development leading to industrialisation. The empirical evidence suggests that the strategy has been successful. Gujarat, however, slided down the relative scale and became only a moderately growing state after the national average rose in 1981-82 largely because it experienced a sharp deceleration in its agricultural growth by 6.94 percentage points in 1982-83. Water shortage and lack of adequate irrigation facilities accounted for such a disaster. Since the industrial base of the state was considerably diversified by then, the long-term growth in the secondary and tertiary sector could be sustained in the face of substantial negative growth in the primary sector. Now is the time for Gujarat to concentrate on the infrastructural investments in the primary sector. If it can somehow regain its previous trend rate of growth in the primary sector, it has the potential to again turn into a high growth state.

The case of Uttar Pradesh (UP) yet another important state to lead the growth acceleration in the national economy, is different from both Maharashtra and Gujarat. UP turned into a high growth state in the year 1974-75 experiencing a more than 100 per cent rise in its overall trend rate of growth. It would have given a substantial boost to the national economy but not sufficient to shift its growth path. The growth strategy of UP was based on emphasising primary production which would, in turn, lead to industrialisation and growth of services would then follow. The primary sector in UP experienced a more than 125 per cent rise in its trend rate of growth in the year 1973-74. Such a sharp rise in the long run growth rate would not have been possible unless it was accompanied by significant resource productivity increase. It would, therefore, imply that the primary sector in UP could release resources for the growth of the other sectors in the economy apart from providing increased supply of raw materials. The secondary sector in UP experienced a significant acceleration of 2.61 percentage points in its growth in the next year, i e, 1974-75 turning the whole state economy into a high growth state. The service sector in UP responded later again with a remarkable rise in its long run growth rate by 2.70 percentage points in the year 1976-77. It is interesting to note that the same sequencing of the sectoral growth acceleration can be observed for the national economy later during 1979-80 to 1982-83. UP, therefore, again slided back to a moderately growing economy relatively to the national average after 1981-82. A significant shift in the growth strategy is needed if UP has to turn again into a high growth state.

The growth experience of Assam and Madhya Pradesh (MP) is again different from the ones of Maharashtra, Gujarat and UP. Both these states turned into high growth states in 1979-80 and were responsible on margin in shifting the national average growth to a higher level in 1981-82. Neither of them experienced any significant shift in their primary sector growth over the period under consideration. Both, Assam and MP experienced spurt in their industrial growth and then in the tertiary sector growth. Assam turned into a high growth state in 1979-80 with a sharp increase in its secondary sector growth of the order of 10.62 percentage points accompanied by 1.61 percentage point increase in its tertiary sector growth in the same year. Considering the magnitudes of the shift in the time trend of the two sectors, it can be argued that predominant influence in Assam is likely to be the growth in secondary sector which would have led to expansion in the service sector in the state economy. In MP, the increase in industrial growth of a relatively small magnitude of 0.85 percentage points occurred in 1978-79. It was followed by a remarkable 150 per cent increase in the long run growth rate of tertiary sector in 1979-80. The secondary and tertiary sectors of MP are likely to be the beneficiary of the spurt of activities in the neighbouring states of Maharashtra, Gujarat and UP over continued period of time. The linkage theory appears to have worked considering the time lag involved and geography of the states involved. The Assam phenomenon, however, seems to be more on account of the oil discovery and the development related with it. Thus, while MP can be considered a follower or a net beneficiary of increasing growth elsewhere, Assam represents a new impulse of growth in the national economy.

Sequentially, the next state to experience significant increase in its overall growth rate is West Bengal (WB) in 1982-83 followed by Himachal Pradesh (HP) and Karnataka in 1985-86. All these three states experienced a very similar magnitude of about 2.5 percentage points increase in their long-term growth rates. WB achieved an early break through in the growth of its tertiary sector in the year 1972-73. However, it was not sufficient to match the national average in the sector. It was only when it achieved a spectacular increase in the growth rate of its primary sector in 1982-83 that it showed equivalent performance in overall growth as the national average. Although spurt in the primary sector growth of WB represents fresh stimulus to the national economy, it is surprising to find its secondary and tertiary sectors not responding unlike in the case of UP. While HP represents a case of exclusive tertiary sector led acceleration in the overall growth in the economy, the

TABLE 5: ESTIMATES OF TREND RATES OF GROWTH AND POSSIBLE SHIFTS IN SECONDARY SECTOR OF INDIAN STATES

States 1	Trend Rate 2	Shift Parameter 3	Optimal Year of Shift 4	R-Square 5
1 Andhra	4.87 (30.69)	–		0.9936

3 Assam	0.38 (0.36)	10.62 (5.90)	1979-80	0.9401
4 Bihar	5.15 (18.99)	1.89 (2.18)	1980-81	0.9761
5 Gujarat	3.57 (13.50)	3.05 (6.21)	1975-76	0.9907
6 Haryana	6.73 (26.87)	1.42 (1.94)	1981-82	0.9887
7 HP	3.47 (9.72)	–		0.9282
8 J and K	6.57 (28.51)	–		0.9801
9 Karnataka	5.56 (33.56)	–		0.9935
10 Kerala	6.98 (11.37)	–4.64 (–5.02)	1972-73	0.9867
11 MP	4.98 (29.25)	0.85 (2.00)	1978-79	0.9910
12 Maharashtra	4.81 (32.55)	–	–	0.9939
13 Manipur	4.23 (5.15)	4.32 (4.13)	1969-70	0.9955
14 Orissa	5.33 (13.62)	–	–	0.9570
15 Punjab	5.74 (27.60)	3.07 (3.08)	1984-85	0.9944
16 Rajasthan	3.05 (16.82)	2.55 (2.85)	1982-83	0.9772
17 Tamil Nadu	4 75 (15.04)	–2.05 (–2.36)	1979-80	0.9734
18 Tripura	2.70 (5.00)	–	–	0.8635
19 UP	4.23 (9.44)	2.61 (3.40)	1974-75	0 9887
20 West Bengal	2.22 (9.17)	–	–	0.9268
All India	4.25 (23.99)	2.15 (4.51)	1981-82	0.9956

Notes and *Sources* are the same as Table 2 above.

case of Karnataka resembles the one of Maharashtra. Karnataka also experienced a significant increase in its tertiary sector growth in 1975-76 with no significant shifts in the remaining sectors of the state economy. However, only after the break-through in the tertiary sector growth, the long-term growth of primary sector became less than half the ones in the other sectors in the economy. Long-term structural changes in the economy made their impact on the overall growth and turned the state into a high growth state in 1985-86. Like Maharashtra in 1972-73, Karnataka in 1985-86 could emerge as a leader of the future shift in the national growth.

The cases of Punjab and Haryana are interesting. Both were high growth states and both scaled down relatively to the national average when the latter rose in 1981-82. Both the states have been high growth states in the primary sector and both have achieved a break-through in their industrial growth during early 80s to become high growth states even in the secondary sector. In the tertiary sector, the growth of Haryana has been very high but Punjab experienced a sharp deceleration in 1979-80 perhaps on account of the beginning of the elongated political disturbance If the tertiary sector growth can be properly managed in these states, they can still achieve their high growth states status. In terms of the growth pattern, they resemble the case of UP. Similarly, Arunachal Pradesh has been a high growth state and its pattern of growth is also primary production based. It is surprising why it has not experienced acceleration in its secondary sector growth after it achieved a major break-through in its primary sector growth in 1979-80.

The Lagging States

In terms of acceleration in growth of incomes, the results reported in Table 3 suggest that eight states, viz. Andhra Pradesh (AP), Bihar, Jammu and Kashmir (J and K), Kerala, Manipur, Orissa, Rajasthan, and Tamil Nadu (TN) are seriously lagging behind the rest. Geographically, these states are spread all over the country. Similarly, they also include states from both the rich and the poor categories. It would be interesting to examine their growth experiences as well from the results reported in Tables 3 to 6.

The cases of Bihar and Rajasthan indicate problems in their development strategy. The tertiary sector growth in both these states increased remarkably during the early 70s. However, it took almost eight years for their secondary sector to respond with higher growth unlike the case of Gujarat where the response of the secondary sector was very quick. The primary production in both these states, moreover, is highly fluctuating as can be inferred from a relatively low r-square in their regressions. Thus, the strategy of concentrating first on the tertiary sector growth which succeeded in Gujarat to make it a leader, did not succeed to the same extent in Bihar and Rajasthan. It could be due to problems of planning and implementation coupled with political will to bring about necessary changes in the policies.

Out of the states showing stagnation in their growth over long period at relatively low level, TN stands out as a peculiar case. Its agriculture has been widely fluctuating with practically no sustained growth over the period under consideration. Its secondary sector registered a sharp deceleration of 2.05 percentage point in 1979-80 around which time states like MP, Assam and Bihar achieved substantial acceleration in their secondary sector growth. However, in 1983-84, TN experienced a sharp increase of more than 100 per cent in its tertiary sector growth. The growth strategy of TN of late appears to resemble the one adopted in states like Gujarat, Bihar and Rajasthan. If it succeeds, although somewhat late, it can achieve a turn-around in its secondary sector growth. Its future performance, therefore, like Gujarat, Rajasthan and Bihar, critically hinges on its primary sector performance.

The experience of another stagnant growth state of Andhra Pradesh (AP) represents again the same strategy of tertiary sector led growth In 1972-73, tertiary sector in AP experienced a major increase in its long-term growth rate. However, the strategy could not succeed to bring about any significant break through in the growth rates of its secondary or primary sectors. It needs to be investigated as to why the strategy failed in AP when it succeeded in Gujarat, Bihar and Rajasthan.

Among the states experiencing significant deceleration in their growth rate over time, the case of Kerala, another state from the south India, is very puzzling. Kerala experienced a marked deceleration of 2.05 percentage point in the growth of total SDP in the year 1972-73. In the same year, it also experienced significant deceleration in its tertiary and secondary sectors. Whereas it is acknowledged widely that Kerala opted for a growth strategy based on human capital development, it is difficult to explain a significant downward shift in its long-term growth rate in the tertiary sector in 1972-73. Deindustrialising processes again initiated from 1972-73 in a major way is also difficult to explain.

The cases of Manipur, J and K and Orissa appear to be very similar. They all experienced significant deceleration in their overall growth rate around the time when their primary sector also went down sharply. However, in early 70s, Orissa and J and K experienced a marked decline in the growth rate of their tertiary sector while Manipur experienced a moderate increase in its tertiary sector growth in 1979-80. Manipur also experienced a more than 100 per cent increase in its secondary sector growth rate in 1969-70 which was perhaps due to its high level of growth in the primary sector

TABLE 6. ESTIMATES OF TREND RATES OF GROWTH AND POSSIBLE SHIFTS IN TERTIARY SECTOR OF INDIAN STATES

States 1	Trend Rate 2	Shift Parameter 3	Optimal Year of Shift 4	R-Square 5
1 Andhra	3.31 (24 91)	2.30 (11.24)	1972-73	0.9970
2 Arunachal	8.80 (9.97)	–	–	0.9802
3 Assam	4.72 (25 42)	1.61 (5.15)	1979-80	0 9978
4 Bihar	1.52 (3 72)	5 11 (8.30)	1972-73	0.9856
5 Gujarat	3.35 (18 04)	3 11 (10.48)	1973-74	0.9958
6 Haryana	7 80 (32.92)	–	–	0.9926
7 HP	5.12 (32 56)	2.45 (3 73)	1984-85	0.9973
8 J and K	6 76 (23.28)	−1.69 (−3.53)	1973-74	0.9923
9 Karnataka	3.86 (23 10)	2.11 (6.79)	1975-76	0 9957
10 Kerala	5.33 (22 46)	−1.69 (−4.73)	1972-73	0.9959
11 MP	3.67 (24.84)	5.89 (14.32)	1979-80	0.9954
12 Maharashtra	4 73 (51 78)	2 43 (4 28)	1984-85	0.9976
13 Manipur	5 40 (39 09)	0.96 (2.75)	1979-80	0.9983
14 Orissa	8.42 (5 61)	−7.10 (3.49)	1970-71	0.9310
15 Punjab	6 41 (33 76)	−2 06 (−5.07)	1979-80	0.9983
16 Rajasthan	3 09 (10 82)	2.00 (3.92)	1974-75	0.9789
17 Tamil Nadu	3 33 (28.44)	3.36 (5.66)	1983-84	0.9935
18 Tripura	3.74 (7 47)	4.92 (5.38)	1975-76	0.9945
19 UP	2.81 (18.86)	2.70 (8.97)	1976-77	0.9859
20 West Bengal	2.56 (20.11)	1.32 (6.72)	1972-73	0.9961
All India	4.37 (87.75)	2.29 (8.45)	1982-83	0.9996

Notes and *Sources* are the same as Table 2 above

in the initial phase. Even after it experienced a marked decline in its primary sector in 1977-78, its secondary sector has not responded adversely so far. This could have been on account of increasing efforts on infrastructure development which would have shifted the growth in its tertiary sector in 1979-80 by 0.96 percentage points. The growth experience of these states reveals that growth of primary sector is a driving force. It is left to the vagaries of weather, it can destabilise the whole economy. Prudent policies and sound planning with emphasis on agricultural infrastructure development can only provide hope for the future in such economies.

Before concluding this section, it may be noted that in terms of secondary sector growth, there is a very sharp geographical divide in the country. From Table 5, it can be observed that almost all of the states experiencing significant increase or acceleration in their industrial growth during the period under consideration belong to the northern part of the country. On the other hand, most of the southern states have experienced either a significant slow down (deceleration) in their industrial growth (e.g. Kerala and TN) or no significant change in their long run growth in the industrial sector (e.g. Karnataka, Andhra Pradesh and Orissa). An earlier study on the regional aspects of Indian industrialisation also clearly brought out a similar finding of the north-south divide [Dholakia 1989]. It suggested that political factors might be very important in explaining the phenomenon. While the present study corroborates the finding of the north-south divide in the Indian industrialisation with the help of a much longer time series data, it questions the dominant role of only political factors in explaining the phenomenon. Since the finding of the present study is based on the growth experience of state economies over a long time series data extending more than 25 to 30 years, more deep-rooted economic factors or deliberate government policies might be at work. In any case, the phenomenon suggests the existence of basic maladies in the economic life or in the way it is organised in the country. An indepth inquiry into this phenomenon is required to gain further insights.

VI
Summary of Main Findings

The present study analyses the available time series data on real state income and its classification into the primary, secondary and tertiary sectors for 20 state economies in India over the period 1960-61 to 1989-90. It employs the techniques of kinked trend line and switching regression to examine the phenomenon of acceleration of growth and identifying the year of break in the time trend in different state in the three broad sectors. The main findings of the study can be summarised as follows.

(1) The phenomenon of the sharp increase in the long-term growth rate of the Indian economy achieved in 1981-82 is not observed in all the states but only in six to eight state economies.
(2) The state economies where the growth acceleration can be established in 1981-82 cover all the five zones in the country. Thus, the phenomenon is not geographically concentrated but dispersed.
(3) The state economies where growth acceleration was felt in 1981-82 together accounted for about two-third of the national economy in terms of most of the important variables like population, employment, area and income.
(4) Most of the states experiencing growth acceleration in 1981-82 belonged to the category of relatively less well off or poorer states as compared to the national average.
(5) The interstate variation in the trend rate of economic growth seems to be considerably reduced after 1981-82 as compared to the period before 1981-82. The implications of such a tendency for the long-term growth equalisation among Indian states would be an interesting area of further research.
(6) Maharashtra, Gujarat and UP turned into high growth states in three consecutive years from 1972-73 to 1974-75 triggering the forces ultimately leading to growth acceleration in the Indian economy.
(7) The factors and growth strategy followed in these three states were entirely different from one another. Even among other states, the growth strategies followed seem to differ considerably.
(8) On margin, the turn around of Assam and MP into high growth states played an important role in the process of growth acceleration in the national economy. Oil in Assam and linkages with neighbouring high growth economies for MP could be the critical factors.
(9) Emphasis on improving growth performance of primary sector in states like Gujarat, Rajasthan, Bihar, Tamil Nadu, Manipur, Jammu and Kashmir, Orissa, etc, can pay rich dividends if properly planned and implemented.
(10) The present study corroborates the finding of an earlier study [Dholakia 1989] about the existence of a sharp north-south divide in the Indian industrialisation. The causes and consequences of the phenomenon is an interesting field of further enquiry.

Notes

[I am highly thankful to Vaidehi Dalwadi for providing substantial computational assistance. I am also grateful to K R Babu for some additional computational assistance.]

* This is implied by considering the reciprocal of the ICOR and breaking it up into three additive components, viz, the marginal product of capital, labour cost per unit of investment and the rate of technological progress per unit of investment. For details, see Dholakia (1993).

DISCUSSION

Exchange Rate and Balance of Trade

Prabirjit Sarkar

SUBSTANTIAL devaluation of national currency (nominal and real) is one essential part of the therapy of the IMF/World Bank for curing balance of payments deficit of a country. Accordingly India devalued twice in 1991. Before this devaluation, there was a slow but steady depreciation of Indian rupee during 1971-91 under the RBI-'managed' float. Now the question is: is there any meaningful relationship between exchange rate and balance of trade?

In the context of India, this question was sought to be answered by me in my earlier paper [Sarkar 1994]. My cointegration analysis did not find any meaningful long-term relationship between nominal and real devaluation of Indian rupee during 1971-91 and India's balance of trade behaviour over the same period. However, the robustness of the result was challenged by some statisticians of the Reserve Bank of India [Nag and Upadhya 1994]. Since annual data provide a small sample for cointegration test, they suggested the use of monthly data. However, their analysis on the basis of monthly data over the period starting from January 1978 and ending on January 1993 supported my conclusion. Only when they reduced the period of study by taking a starting date as late as July 1985, did they get the result they were looking for—that the "exchange rate matters". What is the logic of taking a later starting date?

Here comes the role of their conjecture. The conjecture is that a later starting date gives more weightage to the IMF/World dictated Narasimha-Manmohan regime of liberalisation that reduces market distortions and unveils the so far obscured relationship between exchange rate and balance of trade. Let me leave it to the readers to believe or not to believe in this conjecture.

But I find one dilemma: the later the starting date and the smaller the sample, the less is the power of the statistical test used by all of us [Sarkar 1994 and Nag et al 1994] to examine the existence of an economically meaningful relationship between exchange rate and balance of trade. And the higher the power of the test, the more weak is the relationship found by Nag-Upadhya. I think this signifies something and supports my standpoint.

There is another point—for a study of long-term equilibrium relationship, short-period monthly data may give misleading results.

There may take place an endless 'hi-tech' statistical debate centring around the question whether exchange rate matters or not. But what is the economic reasoning behind my scepticism? It may be useful to remind the readers of some of my earlier arguments [Sarkar 1992]. A number of factors can be mentioned to challenge the effectiveness of devaluation to expand exports and control imports in a less developed country.

Export expansion may not be possible through devaluation for a number of reasons:

Firstly, devaluation of the currency of a less developed country may increase the export volume by reducing the dollar price of export goods but due to the problem of inelastic demand, the value of exports may fall.

Secondly, devaluation by one country may generate a spiral of competitive devaluation by others producing and exporting similar kinds of products. This may result in over-supplies of the commodities in the international market and price crashes. This is the 'fallacy of composition'. In fact, the structural adjustment programmes of the IMF/World Bank often suffer from this 'fallacy of composition' [Sarkar 1991a, b; Sarkar-Singer 1992]. In a recent IMF study [Borensztein and Reinhart 1994], this phenomenon of over-supplies in the 1980s and the 1990s was recognised with little recognition of the fact that their structural adjustment policies in the primary producing countries had some hand in this phenomenon.

This point will be more relevant for India in future when India (following the suggestion of some 'big' economists!) will enter the commodity markets in a big way to take the opportunity of agricultural trade liberalisation under the new GATT agreement.

Thirdly, devaluation may not reduce the export prices in dollar because of a number of factors. Due to devaluation, imported inputs required in the export sector will be more costly. Moreover, costlier imports of food, fertilisers and fuels will create an inflationary situation in a country that relies on imports of these necessary goods. This may result in an inflationary spiral—wages chasing prices and prices chasing wages. Current inflation in India owes much to this factor.

There is another reason for inflation in a country due to devaluation. In the process of devaluation, the budgetary burden of debt servicing rises. The government may have to create money to cover the increased budget deficit under devaluation. This will also feed the inflationary process. The combined effect of all these may create a situation where in spite of devaluation the dollar prices of export goods do not fall. This may induce the policy-makers to devalue further for the sake of achieving a 'real' devaluation leading to a further inflation and again more devaluation. This kind of situation can be observed in many Latin American countries.

Fourthly, even if dollar prices of exports fall and demand rises due to devaluation, export supply may not rise, particularly in the short or medium term, due to different structural reasons such as power shortage, transport constraint and inelastic supply of some specific inputs.

Lastly, the protectionist policy of developed countries can be mentioned. As the World Bank (1989: 15) has admitted, the protectionist policies of the developed countries are increasingly discriminating against the exports of the less developed countries. Hence, just through devaluation it may not be possible to penetrate the market of the developed countries which often take protect-

ionist action in the name of anti-dumping.

On the import side, devaluation does not have much effect on the imports of necessary goods. Moreover, in a country such as India where there is high income inequality and a huge sum of unaccounted money in the hands of some people, it is very difficult to control imports through devaluation accompanied by import liberalisation. In spite of devaluation and price rise, increasing imports of luxury goods and inputs and machines to produce these goods cannot be checked.

Moreover, devaluation-led inflation creates a situation where imports may not be much costlier than domestic goods. Besides all these, in the less developed countries such as India, there is always a craze for 'foreign' goods among a large section of the population partly due to the colonial legacy and partly due to the international demonstration effect. Perhaps this is one important factor behind the US's efforts to seek entry of their costly garments to India in exchange of Indian garments to the US under the new GATT agreement.

Is it possible for the Narasimha-Manmohan regime to control or eliminate those factors in a way as to ensure that 'exchange rate matters'?

Calculating the Fiscal Deficit

D Subbarao

I S GULATI's reservations on the use of fiscal deficit (*EPW*, May 21) in macro-economic policy formulation are valid, if also rather well known. However, his suggestion that there is a measure of arbitrariness in the treatment of some capital receipts in the measurement of fiscal deficit is debatable. The confusion would clear if we define fiscal deficit as

[Total expenditure (revenue + capital)] – [Total revenue receipts + non-debt creating capital receipts]

This definition is unambiguous about the treatment of recoveries of past loans as also of public sector disinvestment proceeds. It is also unambiguous about giving the same status to both the above inflows, an issue called into question by Gulati. The formula provides automatically for netting out recoveries of past loans from fresh loans advanced during the year, just as it provides for netting out disinvestment proceeds from fresh investment in public enterprises. Gulati's analysis allows for ambiguity as he interprets fiscal deficit as "the excess of total government expenditure, i e, expenditure on revenue and capital accounts taken together, over government's current revenues". On the other hand, if fiscal deficit is interpreted, as in the above formula, as the amount the government has to borrow in order to finance current expenditure, both on revenue and capital accounts, the ambiguity would disappear.

It is of course true that like all other aggregates, fiscal deficit too sacrifices much information content, thus diminishing its value in policy formulation. The impact of a given quantum of deficit on domestic demand, external balance and aggregate supply would depend evidently on the structure of revenues and expenditures. Furthermore, the deficit may tend to overstate the expansionary thrust originating from fiscal operations in a situation of high inflation, when a significant share of the government's nominal interest payments may effectively be compensating bond holders for the erosion in the real value of their principal rather representing a transfer of purchasing power.

The terms of borrowing to finance the fiscal deficit are equally critical as they will influence the fiscal deficit in future years just as the terms of past borrowing would have a cumulative impact, through amortisation and interest payments, on the level of the current year's fiscal deficit.

The method of financing the fiscal deficit is of critical importance as well for it influences the macro-economy in ways more diverse than can be captured by its aggregate value or the terms of its financing. The deficit can be financed by borrowing from the central bank (monetisation of deficit), borrowing from the open market through bank and non-bank channels or by borrowing externally. Each method has its own trade-off.

If the financing of the deficit is monetised through government borrowing from the central bank, it affects the money base and the money supply. If the government sector has a dominant role in the economy, as is the case in developing countries, monetisation leads to an excessive growth in money supply resulting in high inflation and balance of payments deficits. Should the government resort to open market borrowing, it may crowd out the private sector by raising interest rates. The decline in investment, should it occur, will affect the competitiveness of the economy in the long run. Reliance on external finance, though deflationary in the short run, has the risk of exposing the economy to exchange rate fluctuations and uncertain debt burden, not to speak of the political vulnerability it leads to.

There is an obvious 'brute force' method of financing the deficit, by having debt repayments rescheduled or simply by reneging on them. While the short-term macro-economic consequences of this option are the same as those from borrowing, postponing repayments diminishes credit worthiness, jeopardises future financing and impairs the integrity of the budget system.

Having noted that the method of financing the fiscal deficit is as important as its quantum, it also needs to be recognised that the appropriate measure of fiscal deficit to be used has to be adapted to the specific circumstances. Especially in a context of high inflation, conventional fiscal deficit turns out to be an inadequate measure for evaluating and monitoring fiscal policy as evident from the experience of Mexico and other Latin American countries in the latter half of the 80s. In Mexico, for example, it was realised that the public sector borrowing requirement (PSBR) contained a large element of debt amortisation in its interest component, thereby distorting the information content of fiscal deficit. To overcome this, a concept of operational balance was derived, by subtracting from the overall economic balance, the inflationary component of the interest payments on the internal public debt denominated in Mexican currency.

Another useful concept is primary deficit, obtained by excluding interest payments from the fiscal deficit, which helps assess the efficacy of the current fiscal policy after netting out the impact of past fiscal profligacy.

To sum up and in the process supplement Gulati's observations, it is true that fiscal deficit, by itself, is an inadequate guide to macro-policy formulation. The method and terms of financing are equally important. Furthermore, the appropriate aggregate deficit measure to be used will have to be dictated by the macro-economic situation as also the policy element to be analysed. There is, however, no ambiguity about the treatment of public sector disinvestment proceeds and nothing particularly wrong in taking credit for these proceeds in determining the fiscal deficit as long as the fiscal deficit itself is used with the caution that it warrants. A fire sale of public enterprises, regardless of fiscal deficit concerns, is in any case a poor proposition.

NEW DELHI BRANCH

NOTES TO THE FINANCIAL STATEMENTS FOR THE YEAR ENDED MARCH 31 1994

(In thousands of Indian Rupees)

1 SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

(a) General

The accompanying financial statements of The Sanwa Bank Limited—New Delhi Branch ('the Branch') have been prepared under the historical cost convention and conform to the statutory provisions and practices prevailing within the banking industry in the country

(b) Transactions involving foreign exchange

(i) Monetary assets and liabilities in foreign currency are translated at the exchange rates notified by the Foreign Exchange Dealers' Association of India ('FEDAI') at year end, except for Foreign Currency Non Resident ('FCNR') account balances under the FCNR Account Scheme which are valued at the relevant rates notified by the Reserve Bank of India Gains and losses arising out of such translation are recognised in the profit and loss account

(ii) Income and expenditure items are translated at the exchange rates prevailing on the date of the transaction

(iii) Contingencies at the end of the year are revalued at the exchange rates notified by FEDAI

(iv) The Branch has during the year, changed its accounting policy of recognising losses arising on revaluation of outstanding forward foreign exchange contracts at year end Had the Branch not discontinued the recognition of such losses at year end other income and net profit for the year would have been lower by Rs 1 986

(c) Investments

(i) The approved government securities intended to be held to maturity, are valued at the lower of cost or redemption price Cost is adjusted for the discount accrued or the premium amortised over the period to redemption

(ii) Government securities not intended to be held to maturity have been valued at the lower of cost or market value Market value has been determined on the basis of the yield pattern on government securities derived by the Reserve Bank of India ('RBI')

(d) Advances

Provisions for doubtful advances are made based on periodical appraisals by management of the portfolio

Following review of the advances for the year ended March 31, 1994, no provisions are considered necessary and accordingly advances are stated at their full value

(e) Fixed assets and depreciation

(i) Fixed assets are stated at historical cost less accumulated depreciation

(ii) Depreciation is provided *pro rata* to the period of use on the straight line method on all fixed assets, except for improvement on leasehold premises which are depreciated over the period of lease Rates of depreciation used are as specified in the Schedule XIV to the Companies Act, 1956, as amended vide notification number GSR 756 (E) dated December 16, 1993

(f) Staff benefits

The Branch has obtained a group gratuity policy from the Life Insurance Corporation of India which provides cover for any gratuity payment arising on the death/retirement of the Branch's employees The premia paid for obtaining this cover is charged to the profit and loss account

(g) Net profit

The net profit disclosed in the profit and loss account is after, *inter alia*

(i) provision for taxes on income in accordance with statutory requirements
(ii) provision for doubtful advances
(iii) adjustments to the value of current investments

18. PRIOR YEAR COMPARATIVES

Prior year financial statements were audited by a firm of Chartered Accountants other than Arthur Andersen & Associates, and have been reclassified, wherever necessary, to conform with the current year's presentation

THE SANWA BANK LIMITED

(Incorporated in Japan with Limited Liability)

NEW DELHI BRANCH

AUDITORS' REPORT ON THE FINANCIAL STATEMENTS UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have examined the balance sheet of the New Delhi Branch of The Sanwa Bank Limited (incorporated in Japan with limited liability) as at March 31, 1994 and the related profit and loss account for the year then ended Our examination was made in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances We have also obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our examination and have found them to be satisfactory

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 and the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not, drawn up in accordance with Schedule VI to the Companies Act, 1956 The financial statements are, therefore, drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949

In our opinion, the accompanying financial statements give a true and fair view of the state of affairs of the New Delhi Branch of The Sanwa Bank Limited as at March 31, 1994 and of its profit for the year then ended

Furthermore in our opinion,

(a) the transactions of the New Delhi Branch which have come to our notice have been within the powers of the New Delhi Branch of The Sanwa Bank Limited,

(b) the balance sheet and the profit and loss account are in agreement with the books of account and give the information required by the Companies Act, 1956 in the manner so required for banking companies, and

(c) the New Delhi Branch has maintained proper books of account as required by law insofar as appears from our examination of those books

PROPORTIONATE ALLOTMENT

HIGHLIGHTS

PROJECT

- Company promoted by Mideast (India) Limited (MIL) flagship Company of the MESCO group
- 100% Export Oriented Unit to manufacture foundry grade pig iron with installed capacity of 4 64 000 tpa
- Buy back arrangement made by the Company with CMIEC for 100% of the production
- First Indo Chinese Joint Venture in steel sector with financial cum technical collaboration with China Metallurgical Import & Export Corporation (CIMEC)
- State of the art Chinese technology resulting in lower overall raw material consumption and one of the highest production in the country of hot metal of 2 tonnes/M³/day (guaranteed by CMIEC)
- Captive 4MW power plant and sinter plant which would run utilising waste gases generated from Blast Furnace
- Strategic location close proximity to iron ore mines port and infrastructural facilities with rail & road facilities running adjacent to plant
- Project appraised and financed by Industrial Development Bank of India

ISSUE

- Promoters MIL & CMIEC contributing in the Equity Capital at the same premium as the investing public
- Easy Liquidity listing of equity shares at the stock exchanges at Bombay Calcutta New Delhi Madras Ahmedabad Hyderabad and Bhubaneshwar
- Income Tax and Wealth Tax benefits

NOTE

- Investors are advised to refer to the paragraph on justification of premium before making an investment in this issue

RISK FACTORS

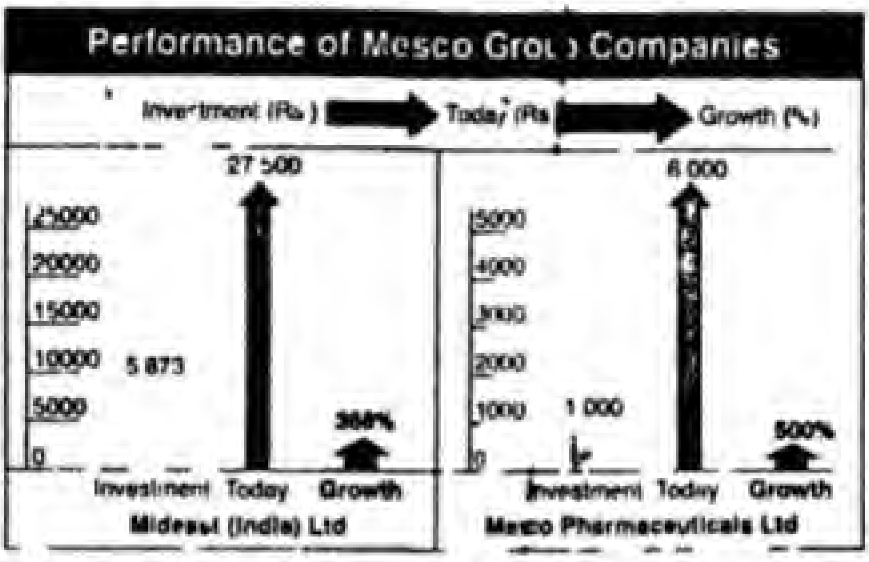
INTERNAL

- Any time over run in the implementation of the project or longer period of stabilisation of production may affect the projected profitability of the Company
- Capital costs have been assessed at prices prevailing at the time of the appraisal which are subject to changes on account of various factors However adequate contingency provision has been made to take care of possible cost escalations

EXTERNAL

- The unit is 100% export oriented Hence any adverse change in government policy on such units may affect operations

* Calculations based on the share prices quoted in 'The Economic Times' of 18 06 94



NRI Application Forms can be obtained by investors from the Registered Office of the Company and also from the offices of the Lead Managers to the Issue

If the Company does not receive the minimum subscription amount of 90% of the issue amount including the devolvement of underwriters within 60 days from the date of closure of the issue the Company shall forthwith refund the entire subscription amount received For delay beyond 78 days of the closure of the issue if any in refund of such subscription the company shall pay interest @ 15% p.a. If there is delay in refund of amount collected the company and the Directors of the Company shall be jointly and severally liable to repay the amount due by way of refund with interest @ 15% pa for the delay beyond 78 days from the date of closure of issue

Rs. 10 ON APPLICATION FOR RIs

Rs. 20 ON APPLICATION FOR NRIs

Public Issue of 3,33,25,000 Equity Shares of Rs. 10/- each for cash at a premium of Rs. 10/- per share aggregating to Rs. 66,65,00,000

Vol XXIX No 36 September 3, 1994

End of Apartheid and After

The South African election of April this year was a world-historic event What made it possible? More specifically, what had led the head of the apartheid regime, F W de Klerk, to make the momentous decision in February 1990 to unban the ANC and free Nelson Mandela? How did the tortuous negotiations between the government and the ANC achieve the constitutional settlement under which the elections were held? And what will the ANC victorious at the polls, make of its triumph? 2355

Foreign Trade and Domestic Output

What are the structural links between domestic output and foreign trade in the Indian economy? Can domestic output be affected by changes in real effective exchange rates, keeping in view their impact on trade and the structural linkages between trade and output? Can other forms of liberalisation influence changes in production and trade? 2364

Weavers Pay the Price

Already seriously threatend by the unequal competition from powerlooms the very survival of handlooms and handloom weavers has now been imperilled by the sharp rise in prices of yarn and dyes—the result of the economic reform programme's all out emphasis on pushing up exports unmindful of the domestic economic and social costs 2331

Deng's China

A good old Stalinist party leader Deng Xiaoping clearly sees an almost organic relationship between an authoritarian political set-up and early development Early capitalism was authoritarian Market socialism cannot be different 2329

Explaining Explanation

The very things which make knowledge possible are also processes which make the social science enterprise a complex of dialogism and mutual participation between the subject and the object This remains not just an external and contingent sociological condition of learning but its constitutive force, which not only drives it, but shapes its form 2350

Head Count

India is unlikely to reach replacement level of fertility at least till the year 2010 Even then the country can expect to reach the stationary population stage only by 2080 and at a population level of some 1 478 million 2344

Ageing Society

Given the anticipated breakthroughs on the fertility and mortality fronts the proportion of the elderly in the population is likely to go up- and so will the related problems 2335

Beyond Stereotypes

Against the stereotype of the bold brassy blasphemist represented by a Taslima Nasreen is juxtaposed another equally pernicious stereotype of the silent docile Muslim woman The flesh-and blood Muslim women who are quietly asserting their autonomy and working for change from within are by and large ignored by the media 2334

Terrorism: Many Faces

Reflecting their political bias many scholarly studies of terrorism ignore the 'tactical' use of terrorism by parties other than the radicals 2340

LETTERS TO EDITOR

State and People's Struggles

N PHUKAN's article 'Militant Left and Struggle for Democracy' (July 23) started on a promising note but his assertion at the end that the state can be turned into an instrument of the people spoiled the whole argument. Wherever the people launch struggles for their rights the state would bring all sorts of oppression to crush them, as is happening in the case of the Narmada Bachao Andolan. Even the so called leftists in West Bengal did not hesitate to crush the Kanoria Jute workers' struggle for their legitimate demands. When the workers resorted to 'rail roko' the police beat them up ruthlessly, raided their houses and roughed up their womenfolk, looted the cash and provisions of the union and disrupted the free kitchen run by the union for the starving workers. Whether it is Kashmir, Bihar, Andhra Pradesh or the North East the state is equally repressive. In the circumstances the common man has become totally alienated from the state. Any mass struggle would alienate them further. Still there is need for mass struggles for a better life and for upholding democratic rights and liberties but not for such absurd goals as turning the state into an instrument of the people.

Then comes the question of who would be the parties to such a joint struggle. Surely not the leftists who rule in West Bengal who are selling state sector enterprises to MNCs for a song and suppressing people's struggles by use of the coercive apparatus of the state while taking progressive anti-GATT, anti-MNC and pro working class stances in the rest of India.

Calcutta

More on *Lajja*

CHARACTERISATION of the turmoil around Taslima Nasreen's fiction *Lajja* as 'A Language Problem' 1, GPD (July 30) is a very imperfect evaluation. True GPD has admitted that he has not read the book and made the evaluation on the basis of reactions from a number of critics and writers who held *Lajja* as a second rate work but there is something more in these reactions. GPD should have noticed that the critics have carefully avoided any comment on the story, events, characters and facts in the book as well as on its theme. This loud silence is so eloquent that it has persuaded GPD not to make a comparison of *Lajja* with Rushdie's *Satanic Verses*.

The theme and message in *Lajja* have nothing to do with the blasphemy of Islam, nor is it a critique of religion or fundamentalism. It does not even deal with patriarchy and women's lib vis-a-vis religious injunctions, Taslima's favourite subject. *Lajja* deals with the miserable plight of a Hindu family in Bangladesh as a result of Muslim reaction in the wake of the demolition of Babri masjid in India. The younger members of the family born well after partition believed that they were integrated in Bangladesh society. The rude and painful shattering of their beliefs and acquired values by communal assault is narrated, mentioned here and there are certain facts representing social and political discrimination against minorities presumably borrowed by Taslima from the book *Bangladeshe Sampradaik Baisamya: Tathya O Dalil (Communal Discrimination in Bangladesh: Facts and Documents)* published by the minority organisation Hindu-Bouddha Christian Oikya Parishad. To me *Lajja* does not appear to be second rate but then tastes differ.

The chief reason behind the calculated reactions from the critics I suspected to be the sensitive issue of communalism. GPD's comment 'Lajja thus is not only taken to be blasphemous' cannot be correct since none of the critics have so accused it. The really embarrassing factor is the feature of a woman of Muslim origin in an Islamic state talking of Muslim communalism. You do not see it everyday. In fact one might brand such talk as blasphemous in the carefully built up normative conduct of our secular circles. Talk of minority repression in Pakistan and Bangladesh tends to strengthen the hands of Hindu communalists of India. As does discovering any communal element in the Punjab and Kashmir militants.

'Second rate' is, therefore, a prudently safe comment if one is forced to break silence. Perhaps GPD has also noticed that none of the critics challenged what Taslima claimed to be facts regarding minority discrimination, not even her Muslim detractors in Bangladesh. Even Bangladeshi friends of Taslima are embarrassed, caught in two minds. They support Taslima's crusade against patriarchy, her fight for women's freedom from Islamic fundamentalism. But Bangladeshi seculars have not yet gathered the strength to combat Muslim communalism head on, as Hindu seculars in India could do against Hindu communalists. If you denounce Muslim communalism you will be liable to be branded as India's agent. Bangladeshi communalists are no less trapped. To oppose or persecute Taslima on the issue of minority repression will be counter productive; it may further highlight the issue and add ammunition to BJP's gun. That is why they resort to accusations of blasphemy and immorality.

Probably this is good. The debate and fight on women's freedom and immutability of religious injunctions are a welcome shift and this is what Taslima had so long been writing about and evoking support too. Communalism is not exactly her own ground and in such an and she may be cornered and isolated.

I do not say that a language problem is not there. What GPD says is true and valid for almost the entire Indian intellectual world not confined only to the Taslima affair which involves much more sensitive issues of communalism and gender oppression. On the other hand I am sad for those who are not familiar with Bengali language: they cannot read Taslima in Bengali and miss such a gem in terms of language!

SUJIT K DAS

Calcutta

Speculators Make Merry

IF a critical evaluation were to be made of the performance of the country's share markets in the recent period, appying the yardstick of socio economic costs and benefits, there is no doubt that the final judgment will be that they operate like sophisticated casinos, to borrow the expression of one perceptive observer. Every aspect of government policy today tends to encourage stock market brokers and other operators. It is hardly surprising then that at a recent meeting the finance minister should have derived much satisfaction from the galloping share prices and stressed the importance of the capital market which was facing a vigorous phase of expansion, confiding candidly that the government's fiscal policy was increasingly getting dependent on market players. Depending on the speculative capital market and financial deals to generate the spread effects of economic development is far removed even from the strategy of a free market system to stimulate production and investment by domestic and foreign entrepreneurs.

Abstracting from the day to day fluctuations which are inherent in the speculative market that the government has consistently nurtured, equity prices have generally shown an uptrend irrespective of the nature of the fundamentals. It is not surprising therefore that the Bombay Stock Exchange's sensitive index (base 1978-79 = 100) should finally scale the scam related peak of 4546.58 reached at mid-day trading of April 2, 1992 (or 4506 for closing quotation on the same day) and touched an all time high of 4588.16 on August 31 (which was also the day's closing). With the natural reaction of the investors, particularly foreign institutional investors (FIIs), to book profit from the high prices, the sensex closed the week somewhat lower at 4526.21 on September 2. A similar sharp jump and subsequent reaction for profit booking had also been witnessed a fortnight ago on August 18 when the sensex had touched 4534.3 followed by a fall the next day. The latest index shows a rise of 68.6 per cent over the level a year ago and, since liberalisation began in July 1991, share prices as represented by the sensex have galloped by over 250 per cent. The broader national index (1983-84 = 100) has also jumped by as much as 240 per cent during the same period. In the process, the repeated contention of the brokers that the absence of forward trading would hurt share market activities and of the FIIs that price-earning ratios in the Indian stock market were so high as to discourage investment have been proved to be baseless.

The boom in share prices can hardly be attributed to any improvement in so-called fundamentals. Except for an excellent monsoon which may produce a bumper agricultural crop and thus help the government to paper over the ill effects of its stabilisation and structural adjustment programmes, there is nothing tangible in the performance of the real sector of the economy that should make for any genuine buoyancy in the corporate sector's fundamentals. Some of the proximate factors which have been highlighted in market reports are expectations of further improvement in corporate results as evidenced by a significant rise in the government's tax receipts, reported rise in output and sales of such industries as automobiles, chemicals, paints, steel and cement and anticipated increases in output of agriculture-based industries, improvement in construction activity and sales of white goods, imminent decontrol of drug prices, accumulation of premium incomes from Euro issues making possible sizeable bonus issues by the bigger companies, introduction of current account convertibility following growing foreign exchange reserves, possible reduction of interest rates by the Reserve Bank in its ensuing busy season credit policy, the containing of the inflation rate at below the two digit level and the market's expectation that the government is now poised to begin a new round of reforms particularly on such tricky issues as exit policy, privatisation of sick public sector undertakings and reform of the financial sector.

No doubt, some of these positive developments have indeed taken place, but the rest are in the nature of financial illusions which tend to conceal the fact that the underlying problems of fiscal imbalance, large monetary expansion and inflationary potential, low level of overall industrial growth (the 8 per cent growth in the single month of April notwithstanding) and, above all, growing unemployment and poverty persist. It is true that the share market is not overtly concerned about these basic issues. It is led more by short-term pecuniary considerations. However, the current phase of excitement cannot be explained by factors such as those listed above. The buoyancy in share prices began about a year ago in August last year when the FIIs, with massive funds at their disposal and with their policy of entering the emerging markets in Asia, took interest in Indian equities. After the FIIs' plunge and within a period of seven months between the third week of July 1993 and end February 1994, the sensex had risen by as much as 104 per cent from a low of 2,105 to 4,286 — which by no means was attributable to the so called fundamentals. The unprecedented impetus to equity prices (almost on par with that during the Harshad Mehta episode) originated essentially in the flow of portfolio investment by FIIs which in turn has stimulated the use of speculative devices by the share broking community. FIIs' gross portfolio investment, which was about $ 45.5 million during the April-June 1993 quarter, rose to $ 194.8 million during July-September 1993 and $ 761.7 million during October-December 1993, totalling a little over $ 1,000 million or Rs 3,100 crore during 1993. Again, during the first eight months of this year (January-August) there has been a further gross investment of as much as $ 2,135 million (or Rs 6,616 crore) by FIIs. Thus, by and large, the excitement in the share market has been stimulated by the inflow of portfolio investment. Because of this inflow of as much as Rs 9,700 crore into the stock market and the limited number of blue chips available in the market, the market capitalisation of BSE listed companies has shot up from

Rs 1,72,951 crore in March 1993 to a mind-boggling Rs 3,98,044 crore in June this year and approximately Rs 4,20,000 crore in August, which would be equivalent to about 45 per cent of gross domestic product at market prices.

The FIIs investment in the Indian share market has occurred despite the fact that against the norm of a multiple of 15 the price earning ratio today rules at 48 to 49. It is the galloping capital appreciation and the possibilities of booking quick profits after a lapse of 12 months, with just a 10 per cent long term capital gains tax to worry about, that has obviously been the motivation for FIIs to take such a great deal of interest in the Indian share market. During 1994 so far FIIs have sold shares worth Rs 1,384 crore which should contain a substantial amount of capital appreciation. On total gross portfolio investment of Rs 9,700 crore the earning cannot be less than Rs 2,000 crore. In fact the benefits for FIIs from many individual deals would be much larger as with preferential allotments wherein they have received a bonanza of as much as Rs 500 crore. Studies have also shown that investors have earned as much as 100 per cent return in just four months between the issue and listing of selected public offerings.

Apart from the FIIs' role in pushing up share prices there has occurred massive speculation encouraged by non-banking financial companies which have been able to mobilise sizeable deposit resources in the liberalised environment. The renewal of share transactions in the non specified shares section by paying the difference in prices on the settlement date even though there is a mandatory provision for delivery within seven days in the cash section has also made its contribution. On any available pretext such as impending book closures the stock exchange authorities with the connivance of brokers club settlements so that forward trading can be carried on merrily. A massive amount of speculation has been reported in cash scrips. Bank finance provided against shares has also contributed to the speculative boom.

It is typical of our regulatory authorities that it is only when the bubble is about to burst that they wake up and conduct enquiries, as is now being done by SEBI, RBI and the ministry of finance even though the malpractices have gone on for years. Such endemic ills as uncontrolled speculation through badla-like operations, clubbing of settlements, malpractices in the grey and kerb market, heavy concentration of trading in a few scrips and insider trading are all persisting without any let or hindrance. Until these malpractices are stopped, the share price behaviour will always be overwhelmingly influenced by them rather than by the so-called fundamentals.

POPULATION POLICY

Ignoring Reality

THE draft Population Policy has come in for sharp criticism from not only the expected quarters—the women's groups and those who do not accept that population control should be a specific or major agenda—but also from the entire long established bureaucratic set-up which administers the family planning programme. Clearly there is nothing outstanding or revolutionary in the recommendations made in the draft except perhaps in its language, an outcome of the current gender-sensitive environment-conscious approach to any problem. While this may be the first policy document which looks at the population problem in the context of environmental sustainability, economic replicability and social equity both in terms of gender and economic status, it is certainly not the first expert group on these issues to have advocated such a paradigm shift. In 1981 the ICSSR-ICMR study group in its report had emphatically suggested that adequate provision of health care, overall integrated development with a better use of resources and especially greater effort at improving the status of women were critical anchors to a population policy. It had also recommended the setting up of a National Commission on Population. Not surprisingly the significance of the draft's more positive recommendations has been somewhat lost. Among the most important of these is the recommendation that the practice of setting targets for specific contraceptive methods should be discontinued. The target approach has not only caused distortions to the family planning programme but, as any grass roots health worker will aver, has resulted in severe damage to other programmes such as MCH and immunisation as well as to other sectors such as primary education. A whole range of workers at the community and village level—community health workers, primary school teachers, ANMs and others—have been forced in one way or another to fulfil the government's family planning targets by acting as motivators. Some field workers have even documented the distortions which have occurred in intra-village social relations as a result of involving people in the race to fulfil targets. Social activists have suggested the setting of other targets which involve measurement of the quality of service. No other policy document has so far had the confidence to suggest an abandonment of the target approach. A related recommendation, the discontinuation of the incentives in cash and kind which have been offered for so many decades to family planning acceptors and motivators is also a welcome one.

The draft policy also proposes that all the funds available from government and bilateral and international donor agencies be credited to "a newly-created population and social development fund which will be utilised for filling the critical gaps" in the effective implementation of the agendas at various levels which are to be set by the concerned 'people' themselves. If indeed 'people' were to decide their developmental priorities, and if the agencies which offer funds for population control looked upon these transfers as purely financial dealings with no strings attached, this would indeed be a progressive move. Unfortunately, funds for population control/development come with ideological baggage containing such definite objectives as the urgent need to limit third world populations no matter what the human cost.

This lack of comprehension about reality whether in terms of relations between developing and industrialised nations or with reference to the class caste nature of society which makes so many apparently feasible solutions unworkable is curious, given the wealth of information and experience available. This unconcern with past experience and current feasibility is seen in the bland recommendations of integrating all vertical national health campaigns for control/eradication of TB, malaria, blindness, AIDS together with MCH, reproductive and sexual health and family planning programmes. Supposedly this will help to promote a concern for total health. While there is much to be said about offering these services at one point at one time surely the authors of the document are aware of the fact that the rhetoric of integrating these services has been an ultimate objective of every document on health? Moreover it is fairly obvious that integration of vertical programmes is only feasible when equal emphasis is given to each. MCH has long suffered from being clubbed with family planning services and there is no dearth of data on this. Similarly while the document is full of good intentions about improving the status of women and making general recommendations in terms of motivating and mobilising the women who will be elected through the reserved seats at the local government level it reflects little understanding of the medical, physical, psychological and social problems women face in taking control of their reproduction. 'Informed choice' in using contraceptives is something of a myth because even when there is information, a woman's freedom to choose is heavily constrained. Similarly, given that gender bias in a patriarchal society is more than a cultural phenomenon shifting the responsibility of family limitation to the couple, even with 'education' only means that a woman loses what little control she does have now. In any case, the issue of reproductive choice and responsibility is far too complex with multiple dimensions and interventions may only worsen the situation. The solution would be to encourage conditions which will increase the potential for women to take decisions regarding their lives—for example, making health services

more gender-sensitive and providing an atmosphere where women can seek answers to their questions and resolve problems

An alternative, and a radical alternative at that would have been to promote the concept of a women's health programme where the objective would not be to achieve a national average of total fertility rate of 2 1 by 2010, but to ensure that women would have access to a gender sensitive, caring total health service which would include not only contraceptive gynaecological and sexual health services but also services for a range of other diseases Such a programme would entail the standing of the population policy on its head that a policy be drawn up for employment food shelter and social and cultural services the implementation of which will in turn achieve the desired population targets

TADA

Spreading Tentacles

AS nothing stirs our bigwigs to protest against injustice we might as well welcome the indiscretions of a high society matinee idol which have turned their attention to the ominous provisions of a law that had been savaging the poor and the innocent in different parts of the country all these years and against which the PUDR the PUCL and individual human rights activists had been warning our society and politicians The arrest of Sanjay Dutt under the Terrorist and Disruptive Activities (Prevention) Act (TADA) has suddenly woken up the cloistered members of the privileged classes to the danger of TADA landing up at their doorsteps

Incidentally this is not the first time that a film personality has been arrested under TADA Earlier two film producers from Bombay Hanif Kadawala and Samir Hingora and a film maker from Guwahati Jones Moholia were hauled up under the same act But they did not make news since they were less known like the 50 000 odd persons still languishing in jails held under TADA Since the introduction of TADA in May 1985 its net has spread beyond the areas for which it was initially meant and its scope beyond the offence for which it was ostensibly framed From Punjab and Kashmir (where terrorist activities provided the centre with an excuse for the introduction and sustenance of TADA in the beginning) the tentacles of the act have spread to places like Gujarat (where the sleuths of our intelligence agencies even by stretching their imagination farthest, have not yet been able to discover terrorists), Andhra Pradesh Assam Maharashtra Rajasthan, Tamil Nadu and Uttar Pradesh among other states The targets of TADA are no longer only the Khalistani terrorists and Kashmiri insurgents They represent an odd assortment of people, ranging from tribal leaders to advocates and judges from journalists to students, from trade unionists to farmers With 19,000 TADA cases, Gujarat tops the list Most of those detained are trade unionists, farmers involved in agitation Muslims charged with communal violence, underworld dons—in short, people whose alleged offences could have been taken care of by the ordinary laws, like the Indian Penal Code The composition of TADA detenus in other states also indicates that the overwhelming majority are either political opponents of the ruling powers or ordinary criminals against whom, if there were any charges the usual penal codes could have been used Even in Kashmir according to a ministerial statement in the Lok Sabha, of the 2 044 persons arrested under TADA till January 1 1991, only 124 were classified as 'terrorists' In Delhi again out of the 138 persons arrested in 1990-92 only 144 were alleged to be militants

The other intriguing aspect of TADA arrests is the way the act has been used against members of the minority communities Human rights groups have already drawn attention to this in their reports on the aftermath of the Bombay blasts Recently in the Lok Sabha an opposition party MP alleged that of the 50 000 odd persons held under TADA 40 000 belonged to the minority communities

What is even worse is that TADA chargesheet had been filed so far only in 5 per cent of the cases Is there any justification for the continued detention of the rest? Besides who will compensate the innocent for the years of their incarceration? Why should they be made to pay for the failure of the authorities to frame charges against them? In Delhi for instance a review panel for TADA detenus has found that in 145 of the 200 cases examined so far the use of the act was unnecessary following which the Delhi government has directed the withdrawal of TADA charges in those cases There are still 750 odd TADA cases in the capital awaiting trial and review

Reports of increasing misuse of TADA in different states— and finally the shindy kicked up by the elite over Sanjay Dutt s arrest—have compelled the National Human Rights Commission at last to recommend the repeal of the draconian act and even to threaten to go to the Supreme Court with a review petition Quite understandably, the state chief ministers—notably those of Maharashtra and Gujarat—are against any move that might curb the unbridled right that they had been enjoying under TADA to arrest arbitrarily any political opponent or inconvenient critic with whom they wanted to settle old scores It s not only the Congress chief ministers who would want the continuation of TADA In spite of their manifest opposition to TADA in the recent Lok Sabha session the major opposition parties had not only acquiesced in its approval in 1985 (when it was introduced) and in its extension in successive years in parliament but had also used it in states where they ruled In October 1991 the then Janata Dal government in Bihar invoked TADA against landless labourers involved in Naxalite movements In West Bengal, the Left Front government invoked it in Darjeeling during the Gorkhaland agitation, but later suspended it For some mysterious reason, on April 29, 1993 it notified Calcutta city under the act

In view of the extraordinary powers that the act confers on the state administration and the police it is very unlikely that the latter would agree to forgo them, whether the states are ruled by the Congress or by non Congress parties In the face of pressures from abroad and popular grievances within the country the centre might at the most strike a compromise by accepting the half-way house suggestion reportedly mooted by justice Ranganath Mishra chairman of the National Human Rights Commission, that if the act cannot be repealed *in toto* at least some of its 'obnoxious provisions' should be removed But then who decides what is 'obnoxious'? The ruling parties and their administration which are empowered to use TADA or those who are at its receiving end?

POLITICS

Low Score

PRIME MINISTER Narasimha Rao's address on independence day has been widely acclaimed as a tactical master-stroke as it is supposed to have been aimed at tackling two birds with the same stone While ostensibly directed at an adversary across the country's western frontiers it is also seen as a successful bid to hijack the central plank of the leading opposition party in the country the BJP Rao s bombardments from the ramparts of the Red Fort are also seen to have the potentialities of affecting another bird within the ruling party itself—the pecking bird at Janpath—if not directly then at least with the fall out The instantaneous change of the prime minister s image from a meek non charismatic and passive drifter to an aggressive 'no nonsense' chief of a self confident regional power is considered to have considerably reduced the need for his compulsive sensitivity to the unpredictable signals from the slowly re emerging recluse and systematic pinpricks from her hangers on

So far so good But what are the real consequences immediate and prospective? First it has immediately strengthened the position of the ruling lady in Islamabad Faced with the boycott of parliament by the opposition—the same travail as faced by Rao himself shortly before and finally overcome thanks to the malleability of the Indian opposition— Rao s heroics offer the Pakistan prime minister very plausible grounds for raising the custom made bogey of the nation in danger for demanding a total(itarian) national unity and thus enables Benazir Bhutto to assume more jingoist postures The resulting competitive exercises in bellicosity although originally contrived on both sides for gaining mileage in internal politics, may at some point go out of control and may assume proportions of real danger to the subcontinent

In internal politics, if the dialectical law of inter-penetration of opposites has some validity then Rao's hijacking of the BJP's plank is at the same time an act of offering himself as a potential hostage to that party From now onwards, it will be a competitive race of tactical skills—who gets the upper hand over whom in the long run

Finally if Rao's scores in these two tests are negative or low, can his image be or remain charismatic enough to ward off intra party bids for subversion? Seen this way Rao's Lal Qilla feat is too clever (only) by half

PULSES

Kesari Dal Dilemma

THE various studies and surveys on the epidemics of lathyrism which occurred up to the 1970s are today regarded as good illustrations demonstrating the social, economic and political roots of diseases There is incontrovertible epidemiological and experimental evidence that lathyrism is the outcome of the consumption of lathyrus sativus or kesari dal which is grown extensively especially in Madhya Pradesh Further as a result of an exhaustive enquiry conducted in the district of Rewa in Madhya Pradesh, following a directive of the Supreme Court in 1982 it was shown that the lathyrism occurred among those families who were paid wages in the form of grain including the poorer and cheaper pulses like kesari dal which formed a substantial portion of their diets This led the government of Madhya Pradesh to ban the payment of wages in the form of lathyrus sativus, but not its cultivation The state incidentally has the largest number of cases of lathyrism a crippling disease which affects the lower limbs permanently The Maharashtra government which has two lakh hectares of land under the crop has banned sale of the pulse for human consumption since 1961 The crop accounts for 3 6 per cent of pulse production in the country and has shown no decline

There is little information available on the extent of consumption of lathyrus However, although lathyrism does not occur in epidemic form now its spread has widened and it is sporadic According to a brief review in the Nutrition Foundation of India's bulletin lathyrus is increasingly being used as an adulterant in red gram and Bengal gram flour This in spite of the fact that under the Prevention of Food Adulteration Act lathyrus is a toxic adulterant With the sharp rise in the prices of pulses, this trend is likely to increase Several attempts have been made to either grow a strain of the pulse which does not contain the toxic components or to render lathyrus non-toxic by various processes All these have largely failed

Ironically, a pulse which was one of the cheaper sources of protein for the poor has been put out of their reach by banning its consumption and in effect of course protecting them to an extent from lathyrism, while permitting its cultivation has encouraged its other uses and its market value, thereby also exposing larger populations to the unknown risk of lathyrism The current move to lift the ban is clearly motivated by considerations other than the needs of the people Equally, however banning its cultivation involves the setting up of an effective enforcement machinery, an impossible task in the current circumstances of state's withdrawal from any sort of intervention

SRI LANKA

Waiting for LTTE's Response

OF the many decisions taken by the Chandrika Kumaratunga government in office for less than a fortnight, the announcement of the partial lifting of the economic embargo on Jaffna is perhaps the most significant This decision will not only allow the government some bargaining space with the LTTE but because it comes without apparent strings, is a show of goodwill which previous governments had never felt confident about taking Notionally the move will also have gained the government support from the local populations— by making their daily lives easier — and so putting pressure on the LTTE to negotiate but just how sensitive the LTTE is to people's aspirations is a moot question

The lifting of the embargo means that there will be free flow of 28 items including soaps timber kerosene tinned foods radios biscuits chocolates and sanitary napkins Items such as batteries certain electrical components and materials which may be used directly in the manufacture of bombs are still banned As usual the LTTE has not immediately responded to the decision publicly But it is significant that not a week earlier, the deputy minister for defence Anurudha Ratwatte had said on the subject of the embargo It is not enough if we issue a gazette lifting the ban on movement of all goods We need an assurance that they will reach those for whom they are intended He was referring to the fact that transport across the lagoon was still in the hands of the militants and that, without the co operation in the matter relaxing such curbs on Jaffna would be a meaningless exercise The government's decision to go ahead with the lifting of the embargo must indicate that it believes that the movement of goods will be effectualised Reports since then do suggest that these items are being allowed into Jaffna

This decision should also be seen in the context of the government's other decisions For instance, not only has the government constituted a ministry for ethnic affairs, Chandrika Kumaratunga has retained charge of it Moreover, the People's Alliance has obtained the right to government only because of the support of the three Tamil parties and the Sri Lanka Muslim Congress The TULF which fought the elections under the UNP banner is reported to be considering its legal options if it were to change sides now The prime minister has stated to the press her willingness to go to Jaffna to meet Prabhakaran She is reported to have said that the cabinet had worked out proposals, different from the devolution scheme which was the outcome of the India-Sri Lanka accord, which she is hopeful the LTTE will consider But all this constitutes the creation of space for the two, the government and the LTTE, to manoeuvre, space that can shrink rapidly if the latter were to reject or delay its response

Again, these moves on the ethnic conflict in the north are an integral part of a new approach in the running of the affairs of the country Keeping its election promise, the government has approved a sharp drop in the price of bread distributed through the network of bakeries More importantly, it will soon introduce a bill to set up a permanent commission on bribery and corruption Several specific commissions of inquiry have been set up to investigate disappearances and political murders According to conservative estimates there were as many as 35 000 disappearances which usually ended in extra judicial executions in custody during 1987 89 when the government launched its counter insurgency movement to suppress the Janatha Vimukti Peramuna

The prime minister has also sought to suspend until fresh inquiry many of the previous government's big deals such as the controversial purchase of Airbus aircraft and the defence equipment deals with the Russian government The latest such cancelled arrangement regarding telecommunications equipment from a Japanese company has prompted unease among business sections which are concerned about how much of the earlier government's liberalisation programme the PA will reverse Given the constraints on the economy especially with the extraordinary strain that the conflict in the north is putting on it the government is hardly likely to want to upset either the business community or western nations or multilateral agencies In fact, given its wafer-thin majority in parliament, political compulsions will influence a great many of its decisions For instance, the cabinet has obviously decided that instead of seeking to transform the role of the president through constitutional reform as it had proposed to do, it will now go ahead with the presidential elections in November and then seek opposition support in bringing about the change And, in the meanwhile, it will strengthen its support base by keeping its other promises a more democratic and open government and, most importantly, finding a negotiated, political settlement to the Tamil problem

Spectra Industries

SPECTRA INDUSTRIES (SIL) was incorporated on July 23, 1992 and obtained its certificate for commencement of business on August 14, 1992, but till now there has not been any manufacturing or trading activity. SIL proposes to manufacture a wide range of automobile sheet metal components like doors, panels, bonnets, dashboards, etc. The estimated total cost of the project is Rs 11 73 crore. After detailed project planning, obtaining of government permission and tieing up of the funds required for the project, the company is now coming out with a public issue of 34 30,000 equity shares of Rs 10 each at par aggregating Rs 343 lakh on September 15. The company is situated at village Murbad Thane in Maharashtra which is well connected by road and rail; the telecommunications link is also well provided for. Besides these advantages the company enjoys easy availability of power, water and skilled manpower and proximity to potential buyers like Premier Automobiles and other automobile manufacturers. The issue will be lead managed by BOI Finance, 20th Century Finance and Dynamic Share Services.

Kothari Pioneer Prima Plus

Kothari Pioneer Mutual Fund, registered as a trust, is a joint venture by the Investment Trust of India (ITI) of the HC Kothari Group and Pioneering Management Corporation (PMC) of the Pioneer Group, USA. John F Cagan of the US Pioneer group is the chairman and president of the mutual fund. The fund plans to come out with its second open ended issue of Prima Plus shares on September 19. The shares, which promise both capital appreciation and a regular dividend, will be available for Rs 10 each during the initial offer period. The fund had earlier in November 1993 launched two schemes, Kothari Pioneer Bluechip Fund and Kothari Pioneer Prima Fund. The target amount for the Prima Plus is Rs 75 crore, but in case the collection exceeds Rs 150 crore the shares will be allotted on a preferential basis to those investors whose investment is less than Rs 1 lakh. Some of the features of this unique scheme are flexibility, liquidity, return of the full amount without any discount to the net asset value and a dividend reinvestment plan.

Bhilai Wires

Promoted by H P Khetawat, Bhilai Wires, a steel wire manufacturing company, is all set to diversify into manufacture of optical fibre cable at Shogi, Himachal Pradesh, with a production target of 4,000 cable kms per annum. The estimated cost of the project is Rs 29 38 crore which is to be financed by a rights-cum public issue of FCDs, aggregating Rs 11 75 crore and the balance of Rs 17 63 crore being covered through term loans. The company has a technical collaboration with Rosandahl, Austria. Application of optical fibre is found in various sectors ranging from telecommunications to defence and other industrial areas, the primary use being in telecommunications. With the rise in demand for telephone lines, it is likely that the demand for optical fibre cables would also increase in the near future. The company intends to commence operations in its new product by January 1995. Lack of demand has forced the existing companies in the field like Hindustan Cables and Optel Communication to face low capacity utilisation. Seeing this Bhilai Wires has not only prudently restricted its project cost but also projected a 45 per cent capacity utilisation in the first full year. The company offers a 16 per cent fully convertible debenture at Rs 50 each, Part A of Rs 15 being convertible into one share after six months from the date of allotment and Part B being convertible at the end of a year from that date into a zero dividend preference share of Rs 10 each. The issue is to open on September 12.

Shree Krishna Polyester

Shree Krishna Polyester, a part of the Krishna group which is involved in the manufacture of synthetic textured yarns and knitted fabric, is undertaking two projects—a backward integration programme comprising of 50 400 spindles and 4 Rotors to manufacture cotton yarn and a forward integration for processing and finishing facilities for 12 000 tpa of cotton knitted fabric. The estimated cost for these two projects are Rs 168 and Rs 44 crore respectively. The company is obtaining its new spindles at a high cost of Rs 32 000 per spindle which can be justified on the ground that they are being obtained from reputed manufacturers like Reiter and Schlafhorst and the company is not availing of the concessional duty of 15 per cent under the EPCG scheme, the company is paying a custom duty of 37.5 per cent. Though the company has opted for imported machinery in case of the processing section the cost of Rs 44 crore seems reasonable when compared with similar projects. The company's past performance has been good with its sales and profits showing a quantum jump by 154 per cent and 275 per cent respectively. The new projects are to be part financed by an FCD offer to the public aggregating Rs 148 crore, each FCD being of Rs 140 which would be converted into two shares at a premium of Rs 60 each on allotment. The company has locational advantages in terms of easy access to raw materials and markets in western India. The company comes out with the issue on September 12. The lead managers to this issue are IDBI, SBI Capital Markets, Apple Industries, Lloyds Finance and Jardine Fleming India Securities, the co-managers being Times Guaranty Financials and PNB Capital Services.

Gujarat Raffia Industries

Gujarat Raffia Industries is engaged in the manufacture of PE/PP woven sacks, PE/PP sheets laminated with kraft paper and PE tarpaulins. The company is now coming out with an issue on September 15 to finance its expansion-cum diversification programme. The project is to increase the capacity of PE tarpaulins by 3,177 MT annually and installation of additional capacity of 255 MT per annum of PP ropes. The company has designs to set up its new plant in village Santej in Mehesana district of Gujarat. The estimated cost of the project is Rs 16 14 crore which is part financed by the issue of equity shares of Rs 10 each at a premium of Rs 10 per share aggregating Rs 8 6 crore, the rest is financed by a term loan from IDBI. The company has performed well for the past three years with increasing sales and net profit. The company has firm export tie-ups with Cinda Industries of Taiwan for a period of five years. Since the location of the project is in a backward area, the company is eligible for sales tax and state subsidy benefits. The issue is lead managed by Anagram Finance and Bank of Baroda.

Northland Sugar

Promoted by Punjab State Industrial Development Board (PSIDC) and Parshotam Lal Maini, Northland Sugar Complex, originally Dasuya Co operative Sugar Mills, is to enter the capital market on September 9 with a public issue of 1 21 crore equity share of Rs 10 each at par aggregating Rs 12 14 crore. The company is setting up a sugar unit with 2,500 tonne crushed per day (TCD) capacity which would be expandable to 3 500 tcd. It is also setting up a cogeneration power plant of 5 MW. The plant is to be located in Hoshiarpur, Punjab. Though Punjab has a yield of 56 9 tonne per hectare of sugar cane the crop does not have high sucrose content and the recovery rate is low at 9 39 per cent compared to the national average of 10 31 per cent. The company is taking up cultivation of sugarcane to meet its raw material requirements. One of the advantages that the company would enjoy is 100 per cent free sale of sugar for a period of nine years under the sugar incentive scheme, 1993. Shares worth Rs 5 10 crore are being allotted to SBI Mutual Fund, 20th Century Finance, Canbank, PNB, GIC and NRIs, thus leaving only 69 91 lakh shares for the public. The post issue equity will reach Rs 23 69 crore, of which the promoters will hold 49 per cent. With virtually no gestation period for the project, production is to commence in October this year.

CURRENT STATISTICS

EPW Research Foundation

The week has seen a phenomenal rise in equity prices with the BSE sensitive index again piercing the scam-period peak of 4547 and touching the all-time high of 4588 on August 31 and settling at 4526 at the week-end. FIIs' portfolio investment and large speculation in cash action scrips have contributed to the spurt. A single month's data for April suggest an annual rise of 8 per cent in the index of industrial production, with manufacturing output showing a rise of 9.7 per cent. The WPI has begun to edge downwards with the over-the-year increase falling to 9.7 per cent, though the food price index has continued with the uptrend. With a significant contraction of net bank credit to government, monetary growth is being arrested. So is the growth in reserve money following a drastic reduction in RBI credit to the central government. During April-June 1994, exports in dollar terms expanded moderately by 8.3 per cent but non-petroleum imports rose by 17.8 per cent.

MAHINDRA AND MAHINDRA

Market Leader

MAHINDRA AND MAHINDRA, the market leader in utility vehicles and tractors, has shown a significant growth in income and profits for the year 1993-94. While net sales increased by 19 per cent over the previous year, the company's operating profits improved by 62 per cent and its net profit soared by 184 per cent from Rs 23.88 crore in 1992-93 to Rs 67.85 crore. Though the company provided for a net non-operating loss of Rs 13.2 crore and a tax provision of Rs 14.7 crore (1992-93 nil), the rise in overall net profit was aided by a 5.5 per cent fall in interest charges and a mere 9 per cent rise in depreciation provision. Encouraged by its performance, the company has increased its dividend rate from 30 per cent last year to 45 per cent on a higher equity base.

With the increase in demand for automobiles, the company's automotive division saw an increase in production from 35,257 vehicles (excluding CKD packs) to 47,110 vehicles, while vehicle sales were higher by 31.2 per cent at 46,251 vehicles as compared to 35,259 vehicles sold in the previous year. Sale of spare parts and also that of press metal components/assemblies were higher the former rising by 14.1 per cent to Rs 47.6 crore and the latter by 18.7 per cent to 8,849 metric tonnes. The declining trend in the tractor industry for the second consecutive year due to the depressed cash crop prices as also the difficulties faced by farmers in obtaining tractor loans saw a 3.9 per cent fall in the industry's total tractor sales from 1,43,602 tractors to 1,38,060 tractors. Consequently though the company's production and sale of tractors fell from 35,454 and 34,052 units respectively to 32,925 and 32,875 units, it maintained its leadership position (for the 11th consecutive year) with a 23.9 per cent share of the market. Though the company's instrumentation division continued to perform unsatisfactorily its automotive components division saw an increase in income of 31.8 per cent over the previous year while its project engineering units successfully executed orders for ash handling plants, spares and travelling water screens (TWS) to the tune of Rs 2.8 crore in addition to completing two TWS contracts with Anpara Thermal power station and DESU TWS. The company's property development division has completed phase I of its Pimpri-Chinchwad housing project near Pune and almost all the flats have been sold. The intertrade division which comprises steel, machine tools, graphics, technical services and steel service centre continued to show an improvement in its performance. It has installed a sophisticated computer-controlled tyre uniformity machine at one of India's leading radial tyre manufacturers and is now executing another order for similar machines in addition to obtaining an additional franchise for marketing and servicing hi-tech instruments.

The company's $ 75 mn global depository receipts (GDRs) (including a green shoe option of $ 10 mn) euro-issue in November 1993 was oversubscribed by 8.5 times, making M and M's issue the first issue without warrants to be priced at a market price.

BAJAJ AUTO

Higher Production

Bajaj Auto, the largest two wheeler manufacturer in the country with almost 50 per cent of the market share in two- and three-wheelers, has substantially improved its production and sales in 1993-94 after two consecutive years of declining volumes due to recession. Net sales went up by 31.79 per cent over the previous year while operating and net profit went up by 82.6 per cent and 183.8 per cent, respectively. Keeping in view the overall upbeat performance, the company has announced an 80 per cent dividend. Further, as 1994-95 is the company's 50th year of existence, and following its substantial build-up of reserves, it has announced a bonus issue in the ratio of one:one.

The company's production of two- and three wheelers rose from 7,73,313 last year to 9,20,762 in numbers in 1993-94, while sale was higher at 9,13,102 (up from 7,66,922).

The company proposes to come out with an euro-issue of up to 4 million equity shares through Global Depository Receipts (GDRs). The company has also reviewed some of its two-wheeler products like the scooter 'Chetak Classic', motorcycle '4S Champion' and M-80 motor cycle and given them additional utility features. The company plans to launch a new sporty 2-stroke motorcycle.

The environmentally conscious company has strictly adhered to the environmental rules. Regular in-house training programmes are conducted to promote effective safety awareness among the employees.

The technical collaboration agreement with the Japanese Kawasaki Heavy Industries has been extended for another four years from October 1993. The extended agreement also covers the technical know-how pertaining to the 4S Motorcycles. Consultations are on with renowned research organisations for developing models which would reduce emissions, keeping in view the need to develop fuel efficient vehicles. The company also proposes to introduce upgraded two- and three-wheeler models during the year.

The company exported 31,079 two- and three-wheelers (including 12,334 ckd packs) as against 17,209 two- and three- wheelers (including 3,760 ckd packs) last year thus entailing an increase of 92 per cent in export revenue. Exports were mainly to Bangladesh, Sri Lanka, Colombia, Mexico, Argentina and Peru as also to European markets such as Sweden, in addition to a new and promising market, namely, Italy, the largest European market.

Meanwhile, for the first quarter of the current year (1994-95), the company's vehicle production improved by 26 per cent over the corresponding period last year and turnover was up 39 per cent over the same period.

ACC

Hit by Recession

ACC, the cement giant belonging to the Tata group, has failed to sustain in 1993-94 its previous year's performance. While the company's net sales increased by 8.5 per cent over the previous year, operating profit was down 12.5 per cent and net profit was down 7.3 per cent. The company maintained its dividend rate at 30 per cent for 1993-94 despite the overall fall in profitability. While the company made no provision for taxation, depreciation provision was lower by 20 per cent.

With recessionary trends continuing to affect the cement industry following reduced government offtake (which accounts for a major chunk of the industry's demand), on the one hand, and a simultaneous rise in inputs like coal, power and freight, on the other put pressure on the industry's margins as a whole, ACC being no exception. The company's plants at Gagal, Madukkarai and Wadi recorded higher clinker production during the year, while production of cement rose marginally by 2.8 per cent from 74.8 lakh tonnes in 1992-93 to 77.2 lakh tonnes. Sale of cement was also only slightly higher at 77.8 lakh tonnes as against 75.1 lakh tonnes (up 3.6 per cent) sold in the previous year. Sale of refractory products from the Katni plant was also higher by 12 per cent at 48,011 tonnes as against 42,871 tonnes sold last year while production of brown tabular alumina at the Kymore refractory plant increased from 2,578 tonnes to 4,662 tonnes. Further, the company sold an additional 13,369 tonnes of franchised refractory products. ACC has achieved the distinction of being a major supplier of turnkey services in the field of refractories and has further expanded its turnkey and application services. As a part of its expansion programme, the company plans to cater to the requirements of large cement plants and for this reason it has entered into a technological transfer agreement with one of the world's largest producers of refractories for the cement industry, namely, Refratechnik GmbH, Germany for producing Magchrome

bricks Commercial production of Magchrome bricks, which will be marketed under the brand name 'Perilex-ACC', is expected to commence by the end of December 1994

Meanwhile the company is in the process of enhancing its total cement production at Gagal and with the completion of the pre-commissioning trials of its new 10 lakh tonnes plant its total capacity will increase to over 20 lakh tonnes per annum Regular commercial production is expected to commence in the second quarter of 1994-95 Installation work of another 10 lakh tonne per annum capacity plant is in progress and the project is expected to be completed by the second quarter of 1994 95 for trial production The company is also installing an additional power plant of 25 MW capacity at Wadi which is expected to be operational in the third quarter of 1994-95 thus insulating it from the uncertain power supply of the Karnataka State Electricity Board The expansion cum modernisation project at the Madukkarai plant which will enhance its capacity to 8 lakh tonnes per annum, has been substantially completed while the project at Falta West Bengal for the manufacture of 10,000 tonnes per annum of high purity synthetic ferric oxide is expected to commence trial production by September 1994

The company plans to come out with a $ 100 mn euro issue and also an issue of up to 5 lakh warrants to certain Tata companies in the near future

DHARAMSI MORARJEE

Drop in Sales

A Bombay based chemical company Dharamsi Morarjee Chemical Company saw a 3 5 per cent rise in net sales during 1993-94 and a 13 6 per cent rise in net profit Operating profit was lower by 6 7 per cent following a rise in operating expenses but a 14 1 per cent lower interest charge coupled with a 26 7 per cent lower depreciation provision helped the company post a positive bottomline The receipt of a major portion of the fertiliser subsidy which was long overdue from the central government has been a contributory factor

While sale of sulphuric acid 100 per cent oleums, chlorosulphonic acid, sulfamic acid, ammonium sulfamate, diethyl sulphate and resorcinol in volume terms increased from 1,25 793 mt, 35,050 mt 41,368 mt, 2,963 mt 543 mt, 919 mt and 135 mt respectively, to 1 66,337 mt, 45,597 mt, 49,532 mt, 3,799 mt 789 mt 1,139 mt and 152 mt per unit realisation fell drastically resulting in lower sale value for these products Sale of single superphosphate, alumina sulphate 17 per cent and stabilised sulphur trioxide on the other hand fell both in volume terms from 3,14,311 mt, 69,120 mt and 2,720 mt, respectively, to 2 75,141 mt, 65,036 mt and 1,778 mt as well as in value terms Thus, though total income from its manufacturing activities fell by 4.7 per cent over the previous year, the company managed to increase net sales only due to a sharp rise of 76 per cent in technical consultancy and contract revenue which rose from Rs 16 5 crore last year to Rs 29 1 crore in 1993-94 The company is heavily import-dependent for its raw materials with yearly import outgo amounting to Rs 52 crore to Rs 71 crore during the past three years, on the other hand, its export earnings ranged from Rs 2 2 crore to Rs 3 7 crore

The company's sale of fertilisers fell by 24 per cent during the year and the fall in sale of single superphosphate was mainly due to uncertainty about the quantum of subsidy and the state governments' delay in fixing prices for the sale of subsidised fertilisers Further, the failure of monsoons in Saurashtra and some parts of Madhya Pradesh also affected sale

With the reduction in rate of subsidy on single superphosphate to almost one fourth of the earlier rate the company expects lower incidence of interest on account of funds blocked in subsidy in the future

Meanwhile the company commissioned its chlorosulphonic acid plants at Ambernath and Jhar in Amreli district the former having an installed capacity of 40 000 mt per annum and the latter having an installed capacity of 16 500 mt per annum The di ethyl sulphate plant at Roha which has an installed capacity of 3 000 mt per annum was also successfully commissioned during the year

The company now plans to diversify and is implementing a project to import and market one million tonnes per annum of refrigerated LPG for which it has already made the necessary applications to the concerned authorities

BROOKE BOND LIPTON INDIA

Amalgamations and Acquisitions

Apart from the merger between Brooke Bond India and Lipton India, the subsidiaries of Unilever plc, to form yet another consumer product giant, the year 1993 also saw the amalgamations of three other companies with the giant company, namely, Doom Dooma India Tea Estates India and Kissan Products Besides, the new company also suceeded in acquiring Dollops business from Cadbury India In January 1992, Brook Bond India had acquired Kothari General Foods Corporation under a rehabilitation-cum-amalgamation scheme approved by the BIFR S M Datta who is the chairman of the other Unilever giant in India, Hindustan Lever, is also the chairman of the new company The gross fixed assets of the company shot up from Rs 83 crore in March 1992 to Rs 239 crore in March 1993

Following all these mergers and amalgamation, the balance sheet figures are not comparable. However, the company's financial indicators do show excellent returns Its net sales have gone up by 104 5 per cent while operating profit and net profit have gone up by 84 5 per cent and 98 73 per cent, respectively The company has decided to give a dividend of 24 per cent which is also payable to the shareholders of the amalgamated companies

The company has been taking measures to maintain its hold over the tea market In line with this strategy the company introduced a range of low-unit price packs to tap the potential of the growing rural market The company has recently set up a new factory at Dharwad in Karnataka and has also launched an ambitious project on black tea research at its research laboratory in Whitefield The company has been successful in consolidating its position as the market leader in the coffee market by registering a good growth in volume and market share despite an overall decline in the market On the edible oil front too the company's brand 'Dalda' has done well though the industry has been facing stiff competition arising out of the combination of severe price discounting by cheaper liquid oil alternatives and severe margin pressures from the new manufacturing units enjoying sales tax exemption Other brands like 'Flora Refined Sunflower Oil' and 'Gold Seal Refined Mustard Oil' have also fared well sales wise The company has implemented an effective programme to reduce manufacturing cost and working capital deployment while maintaining quality The company s short-term bank borrowings constitute only 20 per cent of inventories against the corporate sector average of over 54 per cent.

Brooke Bond Lipton's dairy products too have been doing well and the sales volumes and market share have been very encouraging The company has doubled its spray drying capacity at Etah to meet the increased volume requirements Measures have also been taken to step up the quality assurance procedures at the factory The company has the distinction of having participated in the IRDP programme at Etah and of having seen it being successful The company's bakery products as well as its tea and coffee vending service have performed satisfactorily Its animal feed business has also shown good progress due to effective margin and working capital management Two locations in western India have been tied up with manufacturing facilities to meet the growing market demands for fish-feed plant

The company has also fared significantly well on the export front with its exports growing by around 30 per cent The company has been successfully utilizing the capacity it acquired from its amalgamation of Kothari General Foods The company proposes to set up a 100 per cent export-oriented unit in Etah, Uttar Pradesh, and has applied for the same

Its new projects include entry into frozen desserts and re-launching of Kissan Products

Deng Xiaoping: A Senile Ninety?

GPD

With all his faults, Deng Xiaoping and, because of him, the other leaders of China are the only people in the developing world who are able to hold their own against the 'hegemonism' and big power chauvinism that have come to mark the post Soviet world

IT was on December 8, 1989 that *The Washington Post* had editorially passed the typical American judgment that Deng Xiaoping had gone senile. It was a typical American judgment in the sense that Americans are the last white people to carry the burden like their colonial forbears during an earlier era. They have therefore the right, at any rate so they think, to pronounce 'other' people sane or insane, civilised or uncivilised. *The Washington Post* was merely exercising that right or perhaps following that instinct in assessing the sanity of a leader of over a billion people.

Five years later the allegedly 'senile' leader continues to dominate Beijing, China and the world at large. Of course, *The Washington Post's* rather irresponsible judgment was made in the context of the Tiananmen Square incident of June of that year. What happened then is fairly well known and hardly needs repetition. But whatever else the repression there might have been, it was *not* a function of Deng Xiaoping's or anybody else's senility. The new course that the Chinese economy had followed since 1979 made that inevitable. If anything it was a function of getting 'waist deep in big muddy' to borrow the words of the once popular Joan Baez song. (We had borrowed them earlier five years ago in these very columns to talk about the much discussed Tiananmen Square incident.) Now that practically the whole of the developing world has opted for and heartily welcomed economic hegemony it is pointless to suggest that Deng Xiaoping is senile. And, indeed, *The Washington Post* has not repeated the judgment in its columns, as far as the present writer can tell.

Deng turned 90 on August 22. This man has ruled China directly and in a thoroughgoing sense ever since he became the secretary general of the Chinese Communist Party in the mid 50s. It is even possible to argue that he has dominated it longer than Mao Zedong could. Mao Zedong had become an icon of the Chinese Communist Party. His individual standing was great. At the same time, since 1949 the periods when he was in a minority within the policy-makers in China were longer than the periods when his political line was supreme. In fact, but for the period of the Great Leap Forward and the early years of the Cultural Revolution (1966-69), which together do not account for more than a decade, Mao had never been the dominant policy-maker in China, let alone an Emperor as Harrison E Salisbury makes him out to have been in his 'dual biography' of Mao and Deng. It is Liu Shaoqi and Deng Xiaoping who dominated from 1956 when Liu as the president of the People's Republic and Deng as the general secretary of the Communist Party came finally and firmly to the fore.

It is important to note this dominance. If this dominance had not been all pervasive, these two men would not have been singled out for attack as the 'capitalist roaders' by the Cultural Revolutionaries. This kind of charge has perhaps lost much of its meaning today because everybody around the world is or has become a 'capitalist roader' or at any rate a 'market roader'.

These 10 years and his early years as a party man in the 30s have made Deng an efficient organisation man. He is a man for order and discipline. He had already demonstrated that, especially during the years which followed the Great Leap Forward, 1961 to 1965 were typically years of Liu Shaoqi and Deng Xiaoping. The economic policies have changed since. But the politics has not. The political leadership of the Communist Party was asserted at that time. It has been reasserted again since the new economic policies were introduced in December 1978. The command structure in China was sought to be destroyed by the various movements China has been witness to. The latest and the biggest in that series was the Cultural Revolution. Deng Xiaoping has reconstructed that structure. Deng has been no 'emperor'. He has been a good old Stalinist party leader.

To be sure, nobody would like to describe him as a Stalinist. His economics is widely different from that of Stalin. If Salisbury's account is to be believed (in his 'dual biography' referred to above) Mao and Deng have been more avid readers of *The General Mirror for the Aid of Government*, a traditional political classic written 1300 years ago, than of the works of Marx, Lenin and Stalin. But an Asiatic classic is an 'Asiatic classic'. And any number of people would testify the 'Asiatic' element in Stalin and in the principles of political and economic organisation that Stalin espoused.

In any event, whether Stalinist or not, Deng Xiaoping clearly sees an almost organic relationship between an 'authoritarian' (by liberal democratic and western standards) political set-up and early development. He did so during the early 60s when nobody in the western world liked him. He does so now when almost everybody in the western world likes him. Early capitalism was authoritarian. Market socialism cannot be different. The Tiananmen repression was not against the democracy movement as a number of people seem to believe. It was a reaction against the nightmare of disorder that the earlier 'bombarding of the headquarters' (of the Cultural Revolution years) had meant for Deng and his comrades. In point of fact, nobody can condemn both the Cultural Revolution and the repression of the Tiananmen Square in the same breath. The opponents of the first like Deng did not like disorder, anarchy and chaos which the Cultural Revolution meant for the leadership in Beijing. The Cultural Revolution celebrated 'disorder', or so it seemed to Deng. He was not altogether wrong. Beginning with 1969 we have nothing but the decline of the Cultural Revolution. Deng and his comrades were reacting to the same. Deng had to reassert 'order' and the central and leading role of the Communist Party.

If the Chinese experience appears far healthier and important than either the Soviet or the Indian experience it is because the instrument of change (in this case an organised Communist Party) has not been ignored or lost sight of in China. The credit for this will have to be given to Deng. Gorbachev failed because he could not see the utility of an organised party. India's ruling party has ceased to be organised and disciplined. Not being an economist we are in no position to predict the future of the economic experimentation with market socialism which is really capitalism with Chinese characteristics. But if it works, the credit, at least for the initial stages, will have to go to the CPC and therefore to Deng Xiaoping.

This is also the reason why Deng's China is in a position to assert itself in world politics. It has administered a blunt rebuff to the western world that the question of human rights cannot be considered independently of national sovereignty. The western world has quietly accepted the claim without saying so. China is one country which does not, so to speak, celebrate the end of the cold war. It still talks of hegemonism and rightly so. With all his faults Deng and because of him, the other leaders of China are the only people in the developing world who are able to hold their own against 'hegemonism' and big power chauvinism that have come to mark the post-Soviet world. The degree of realism and the acute sense of power equations that mark China's worldview are of Deng Xiaoping's making. It would be unrealistic and unwise to deny that credit to him.

Whatever one might think of Deng Xiaoping's policies it would be idle to underrate him in a world which has leaders like Clinton, Major, Yeltsin and the like. It is therefore amazing that *The Washington Post* in a fit of anger actually called him senile. Deng might actually laugh at that and tell the editor (if such a thing exists in post modern journalism!) that he is free to watch the splendours of his senile 90s as long as he remembers that because of Mao Zedong 'China has stood up' and because of himself it continues to stand up, especially to the Americans.

ANDHRA PRADESH

Handloom Weavers' Struggle for Survival

K Srinivasulu

Already seriously threatened by the unequal competition from powerlooms, the very survival of the handloom sector and of handloom weavers has now been imperilled by the sharp rise in prices of yarn and dyes—the result of the economic reform programme's all-out emphasis on pushing up exports unmindful of the domestic economic and social crisis.

EPURUPALEM is typical of the numerous weaver's colonies in and around the prosperous commercial town of Chirala in Prakasham district in Andhra Pradesh. The scores of thatched huts that dot these colonies present a monotonous picture. To get a glimpse into the life of an average weaver, you have to look inside these dimly lighted and poorly ventilated structures which serve both as the working and the living place. Most of the space is taken up by a loom or two worked upon by the man and the wife with the children busy in the preparation of the accessories of the warp and weft like bobbins, candles, etc. In the predominantly weaver town of Mangalagiri (in Krishna district) on the Vijayawada-Guntur highway, emaciated weavers may be found working in the worksheds resembling godown-like structures tiled with asbestos sheets and crowded with dozens of pitlooms which, with their monotonous noise and clouds of dust raised by the regular and simultaneous pick-beating, evoke images of historically not-so-distant labour camps. The weavers live in dwellings created by partitioning similar asbestos tiled structures into small compartments and leased out on rents of Rs 100 to 150 by the master-weavers.

Epurupalem along with Vetapalem, Thotavaripalem and Jandrapeta in the vicinity of Chirala town and Mangalagiri were in news for the starvation deaths of weavers in 1991 when crisis loomed large over the handloom sector following the sudden spurt in the prices of cotton yarn and chemical dyes, throwing thousands of weavers into unemployment, starvation, disease and death. The severity of the crisis was evident in the fact that between September and November 1991 around 110 weavers were identified to have either committed suicide or died of starvation.

Within three years the handloom industry is once again caught in a crisis that is even more severe in intensity, with cotton yarn prices shooting up by 23 to 55 per cent between December 1993 and May 1994, compared to a 20 to 38 per cent increase after the presentation of the budget in 1991. What is being witnessed in the weavers' colonies is stoppage of weaving activity and helplessness and despair among the weavers. The reports of starvation deaths from Koyalagudem (Nalgonda district), Addepalli (Guntur district) and Mangalagiri evoke a sense of a *deja vu*.

ORGANISATIONAL STRUCTURE

The handloom sector is a major employer next only to agriculture. There are estimated to be around 16 million weavers employed in this sector in the country. Andhra Pradesh, following Tamil Nadu, has the second largest concentration of handlooms. There are around 25 lakh weavers employed on some 5.35 lakh handlooms. The handloom industry can be divided into three segments on the basis of the organisation of production: (i) co-operatives, (ii) independent weavers (iii) master-weavers.

The history of handloom weavers' co-operatives goes back to the early 1950s. Launched with the objective of protecting the interests and independence of small weavers from the powerful traders and intermediaries, the co-operative sector is supposed to encompass 60 per cent of the looms in the state (while the all-India figure is just 35 per cent). But in actuality many of these co-operatives are non-functional as a large number of looms in this sector have been rendered dormant over the years. The floating of bogus co-operatives by the influential master-weavers and traders with a view to cornering the loans provided by banks and marketing facilities extended by institutions such as the Andhra Pradesh State Handloom Weavers' Co-operative Society (APCO) is a major factor in the increasing prevalence of corruption in the co-operative movement that obstructs the flow of funds and access to market facilities to genuine co-operatives. The ineffectiveness or rather non-functioning of a large number of co-operatives in fact is due to the irregular supply of raw materials and inordinate delay in the payment, the reason why many members prefer to work for private master-weavers as wage labourers.

The second sector consists of independent weavers who own the instruments of production, purchase raw materials, i e, yarn and dyes, from the market and produce the cloth with family labour and sell the product either in the local village market or to the local cloth merchant. With the cheap and wide variety of cloth produced on the powerlooms flooding the countryside, especially from the 60s, and with the prices of cotton yarn and chemical dyes rising, the independent weavers, even those owning two or three looms, are being forced to join the ranks of wage labourers due to their inability to withstand the competition from powerlooms and master-weavers and keep the prices of the coarse variety of dhoties and sarees which they produce within the reach of rural poor. For sheer survival a vast number of these weavers have migrated to the textile centres in western India like Bhiwandi and Sholapur in Maharashtra and Surat in Gujarat to work in the powerloom industry and in mills and others have settled as wage labourers to the master-weavers and as agricultural labourers. The migrant weavers from Khammam and Karimnagar districts found in Koyalagudem, an important export varieties production centre in Nalgonda district, or the weavers from east and west Godavari and Srikakulam in Mangalagiri, a major handloom centre in Krishna district, are testimony to the large-scale displacement of self-employed weavers due to the unequal competition from the proliferating powerlooms.

In the urban areas where the availability of alternative sources of livelihood is relatively better, low wages and continual insecurity in the handloom sector has forced the youth to abandon their family vocation. For instance, in the predominantly weaver colonies of Karawan, Katedan, Hussainialam and Sultanshahi in the old city of Hyderabad we find only the late middle aged men and women still continuing to eke out a livelihood from weaving while the younger generation has settled as shop assistants, autorickshaw drivers and construction labourers where average daily earnings are much higher. According to Chilweri Manik Rao, a veteran trade union leader who himself hails from a weaver's family, while a decade ago there were 1,400 active looms in Karawan now their number has come down to just 200.

TABLE: RISE IN COTTON YARN PRICES
(Rs per bundle of 4.5 kgs)

Count	1986	January 90	Pre-Budget 91	Post-Budget 91	December 93	March 94
40s	120	215	250	295	280-290	400-450
60s	280	400	465	560	380-390	550-595
80s	240	550	560	675	600-650	730-740

The master-weaver system has over a period of time become well entrenched and formidable. With the marginalisation of weavers' co-operatives and the decline of independent weavers, the master-weaver system has become the dominant mode accounting for three-fourths of the total handloom production in the state.

Two kinds of practices can be identified here on the basis of the conditions of work and nature and extent of dependence. One, where the weaver gets the raw materials to his house, which is both his living and working place, prepares the warp and spins the cloth on his own loom as per specifications. In this all members of the weaver's family are involved. Here the wages are paid piecewise, in addition to a payment for the preparation of the warp, bobbins and other accessories. Though this practice is generally declining, it can still be found in handloom centres like Pochampally (in Nalgonda) and Gadwal (in Mahabubnagar) where specialised tie and dye and jarri varieties are produced. For all practical purposes the weaver here is a wage-labourer, yet his ownership of the loom and the possibility of demonstrating his workmanship give him a sense of satisfaction and perceived independence.

Second is the practice that we find in centres like Mangalagiri and Koyalagudem where there is a high presence of migrant labour. These homeless and loomless migrant weavers work for the master-weavers in their worksheds, each accommodating a dozen or two pitlooms, and live in one-room tenements rented out by the latter.

Policy Shift

The roots of the crisis that the handloom sector is presently gripped by can be traced back to the policy shift brought about by the Rajiv Gandhi government as a part of the so-called modernisation process initiated ostensibly to pilot India into the 21st century. This shift marked a decisive departure from the stated objectives of social justice, welfare and employment generation and in its place substituted market-led productivity and efficiency as objectives worth pursuing. As a part of this shift, the government introduced the New Textile Policy in 1985. In contrast to the policies pursued after independence, which were cognisant of the importance of the handloom sector in the economy both in terms of providing employment and producing cheap cloth for the rural and urban poor, the 1985 policy statement proclaimed the production of cloth as the exclusive objective to the neglect of employment thereby ignoring the close and positive relationship between production and employment in the handloom sector.

This policy shift had given a further fillip to the powerlooms, which since 1960s have recorded a phenomenal growth. The powerlooms which have come up illegally, flouting all procedures, outnumber the registered powerlooms. The role of mill-owners in the proliferation of powerlooms cannot be overlooked. To undo the capacity restrictions on mill production the mills set benami powerlooms. These enjoying the patronage and protection of powerful lobbies, not only evade taxes but also do not come within the purview of labour welfare laws and the minimum wages act. Thus the perpetual insecurity of the workers in this sector. Taking advantage of the unorganised nature of labour, the powerloom owners could successfully keep wages low and thereby sell their product cheaper in the market.

The impact of the growth of powerlooms on the handloom sector has been disastrous. According to the Shivaraman committee (1974), the setting up of one powerloom employing a couple of workers rendered six handlooms idle and resulted in the displacement of two dozen handloom weavers. Taking note of this ground situation, it firmly recommended protection of handlooms by controlling the growth of the powerloom sector. In tune with this, the subsequent textile policy (1981), at least on paper, displayed concern for handloom protection by imposing restrictions on the powerloom sector. The 1985 textile policy[1] made a major departure from this perspective with its rhetoric of productivity and efficiency to pave the way for further growth of powerlooms by removing restrictions and extending concessions in customs duty on import of synthetic polyester yarn, machinery and technology.

Reservation Act

The story of the Handloom Reservation Act passed by parliament in 1985 deserves to be narrated. As per this act, 22 varieties of cloth were reserved for the handloom sector. The powerloom and mill-owners challenged the constitutional validity of the act in various high courts and finally in the Supreme Court of India. The lackadaisical and disinterested administrative response resulted in an *ex parte* stay on its implementation in 1986. The government's unconcern for the fate of this legislation was demonstrative of the influence and grip of the textile lobby on the powers that be. It was only in 1990 that the National Front government, due to the interest and efforts of the then textile minister, Sharad Yadav, initiated the process to bestow constitutional status to the handloom reservations. But before it could be realised the NF government fell. Nothing was done in this direction by successive governments thereafter. All this is now part of history.

Against this background the Supreme Court judgment upholding the Reservation Act delivered on March 7, 1993 stands out as an important landmark. In September 1993, the government instead of making necessary institutional arrangements for the implementation of the act, constituted an advisory committee consisting of five members to study powerloom and handloom production and examine the possibility of introducing changes in the list of 22 varieties reserved for handlooms. This attempt to reopen the issue which was otherwise settled by the court judgment points to not only the governmental indifference towards handloom weavers but also the powerful influence of the textile lobby on the government.

The yarn produced in the spinning mills is of two kinds. One is cone yarn used in the production of powerloom and mill cloth, the other is hank yarn used by the handloom weavers. As per the government stipulation issued after the 1993 crisis to make hank yarn available to the handlooms, it was made obligatory on the part of spinning mills to supply 50 per cent of handloom requirement at reasonable prices. But how freely the spinning mills violate it and how little the control of government is, is evident from the frequent scarcity of hank yarn and resultant increase in its market price. It is no exaggeration to say that it is standard practice with most of the spinning mills to show the requisite percentage of its production in hank form in the records and to convert it into cone yarn on the sly to earn more profits.

Thus the non-implementation of the reservation act paved the way for unequal competition with the powerlooms and irregular and inadequate supply of hank yarn has led to a sharp decline of the handloom sector during the last decade. According to textile ministry sources, between 1985-86 and 1992-93, while there was a sharp increase in powerloom production from 55.4 to 71.86 per cent, handloom cloth output has registered a dramatic decline from 24 to 9.75 per cent. During this period, the share of mill cloth in the overall textile production declined marginally from 20.6 to 18.39 per cent. With increase in the number of powerlooms there was a substantial rise of 16.46 per cent in powerloom production. On the other hand, unable to withstand competition from powerlooms, many handlooms have been rendered dormant and a large section of weavers have been thrown out of employment and handloom production has recorded a sharp fall of 14.25 per cent. Through its indifference or rather tacit support the government has contributed to the present state of decline of the handloom sector.

Recurrent Crisis

The periodic crises in the handloom sector is an immediate consequence of the unpredictable and sharp rise in prices of cotton yarn and chemical dyes. The major crisis in 1991, which surfaced within months after the presentation of the 1991-92 budget, was a direct consequence of the increase in the prices of 40-60-80 counts yarn from Rs 45 to Rs 115 per bundle of 4.5 kgs. Finding it unprofitable to continue production due to the price increase, many master weavers discontinued production and as a result workers were thrown out of employment and pushed into starvation, disease and death. Within a span of three months between September and November 1991 there were around 110 starvation deaths and suicides. The handloom centres of Mangalagiri and Batuprolu in Guntur district headed the list with 40 deaths followed by Epurupalem and Chirala in Prakasham district with 28 deaths.[3] Throwing the principle of accountability to the winds the Congress state government kept denying that these deaths had anything to do with starvation, instead attributing them to old age and ill health.

The present crisis facing the handlooms is once again a direct fall-out of the sudden and unpredictable spurt in prices. Between December 1993 and May-June 1994, the 40-60-80 count hank yarn prices rose by Rs 120 to 200 (see the table). The prices of chemical dyes almost doubled.

The disadvantage that the handloom sector suffers from in the textile market, given the stiff competition from powerlooms, is such that the prices of handloom cloth cannot be raised corresponding to the increase in the raw material prices. To cite one instance, during the 1991 crisis a handloom lungi was priced Rs 40 in Chirala and Mangalagiri markets whereas a powerloom manufactured lungi was available for just Rs 20. As a result there was a massive piling up of stocks of traditional varieties such as lungies, dhoties and sarees. The usual response of the master weavers to such a situation (especially when the price rise is within the range of manageability) is to transfer the burden of the increase in the cost of production on to the weaver through a corresponding cut in the majoori' (wages). When the price rise is extraordinarily high, the master-weavers find it unprofitable to continue production.

The impact of rise of yarn prices this time is not limited to the handloom sector alone but has been felt by the powerlooms as well. The severity of the crisis can be gauged from the reports that by the end of April in the textile city of Sholapur in Maharashtra around 30,000 powerlooms were closed down rendering 1,50,000 weavers unemployed. In Orissa the closure of 5,000 powerlooms resulted in the loss of employment for 50,000 workers.[4] If the severity of the crisis is such that even the powerlooms, which are otherwise in a relatively advantageous position could be thrown out of gear, the loss suffered by the handlooms is unimaginable.

The question that is crucial to an understanding of the handloom crisis is: why the increase in hank yarn and chemical dye prices? Any attempt to answer the question has to take into account the shift in overall policy-making from the mid-80s. The liberalisation process initiated in the mid-80s and vigorously pursued from early 90s encouraged exports regardless of domestic requirements out of the predominant concern to earn foreign exchange. The impact of the export promotion policy has been disastrous on communities that continue to pursue their traditional occupations such as weaving and fishing.

There has been a rapid increase in cotton yarn exports from the late 80s. While in 1988-89 yarn export was 53 million kgs, it rose to 63.62 m kgs in 1989-90 and to 94.68 m kgs in 1990-91. The impact of the export drive in the present dispensation can clearly be deciphered from the fact that in 1991-92 yarn exports rose to 110.99 m kgs while production of yarn decreased from 1,510 m kgs in 1990-91 to 1,450 m kgs in 1991-92. Regardless of the protests in the press and the indignation of weavers' organisations, a staggering 149.33 m kgs of yarn were allowed to be exported between April and November in 1992, while the production during this period was only 955 m kgs. What is important is also that between 1989 and 1992 the share of hank yarn in total exports rose from 64 to 86.8 per cent. It is yarn in the 20s to 40s counts that constitutes a large proportion of exports and this explains their scarcity and the sharp rise in their prices.[5]

The rise in prices of chemical dyes is an added dimension of the handloom crisis. Due to the increasing awareness of environmental pollution and health hazards that large-scale manufacture of chemical dyes involves, the advanced industrial countries have reduced their production and turned to importing them from countries like India. The export promotion strategy of the present government, whose principal concern has been to increase its foreign exchange reserves, has contributed to the scarcity and rise in prices of dyes.

The most visible victims of the economic policies launched as part of the liberalisation drive are those sections of society who are disorganised and whose community support base is weak. The plight of handloom weavers is illustrative of the unfolding grim prospect for the vulnerable communities in our society. Their fragmentation is such that in spite of the fact that they have been victims of the greed of master weavers, traders and moneylenders and the apathy of the state, the weavers have remained mute spectators to the crisis they are in. Even when they have undertaken certain forms of collective action, sporadically and locally, the dominant interests in the handloom sector, closing their ranks, have seen to it that the brittle organisation gets broken.

The failure of the left to make any dent into this significant constituency, in spite of their weavers' fronts which have anyway remained ornamental show pieces, is a sad commentary on their political vision. For political forces that claim to be fighting the anti-people policies that form part of the liberalisation package, this is the terrain where the struggle ought to be conducted.

Creating Taslimas

Vimal Balasubrahmanyan

There are Taslimas and Taslimas. They reject what they regard as unfair. Some are believers some are not. But only the latter are publicised, and hounded. And thus is born a stereotype of the bold, brass blasphemist.

PERHAPS its the way the media has portrayed it, but an impression created by the Taslima controversy is that any Muslim woman who says anything negative about customs which are defended in the name of religion will have the mullahs and their supporters crying for her blood. And so she'd better not dare. What gets obscured in this haze of hype is the existence of many other Muslim women who, too, are critical of unjust customs, and who, too, have the courage to say so.

During a study-circle meeting in Baroda, two members of a local NGO presented some of their findings from their survey of 388 Muslim women in the city. Over 90 per cent of the women interviewed expressed the view that polygamy and triple talaq are unfair. They were unclear as to how changes in personal law could be brought about but were emphatic that a uniform civil code was not the answer. One of the researchers, who had conducted most of the interviews in the 'bastis', recalled that an initial reaction was: what's the use of all these questions, how is it going to change anything for us? The women were also suspicious and resentful of non-Muslim (read Hindu) researchers asking questions related to their personal law. While stating that some of the customs were undesirable they felt it necessary to stress all the positive and progressive aspects of their religion.

One fact emerging from this survey and various other contemporary writings is that many Muslim women do want change and they want it to emerge from within their own framework. Some because they feel that the unfair practices which are prevalent are actually un-Islamic, and others because they believe that such an approach alone is strategically sound. For example, a Muslim friend in Bombay tells me of an initiative by a group of progressives, men and women, towards drawing up a standard nikah-nama, which will adequately safeguard women's interests, and towards getting it accepted and propagated by the personal law board.

In an essay on 'Women's Rights and Human Rights in Muslim Countries', two Muslim women academics suggest that a struggle *within* Islam is, at a strategic level, more likely to succeed than "an emancipatory struggle operating entirely within a secular framework". (One of the contributions in *Working Out: New Directions for Women's Studies*, 1992.) They offer two very persuasive reasons for their argument. One, the 'secularism' of the women's rights movement alienates, and therefore excludes, many women from the struggle. And two, giving up a struggle within Islam only clears the path for fundamentalist arguments and endangers women's rights even more. The authors refer to 'ijtihaad', a technique of 'creative juristic reasoning', as a strategy which has sanction within Islam and which could be effectively used to evolve an interpretation of the sacred texts in a manner compatible with gender equality.

All this could be something which feminist groups might have difficulty coming to terms with. Though of course in various recent writings feminist activists have stated in so many words that one of the short-comings of the women's movement has been its uneasiness with the phenomenon of women actually deriving strength and solace from the very religion (any religion) which oppresses them

If Taslima had presented an image of a devout Muslim condemning all the customs which she felt were un-Islamic, I'am not sure how the 'secular' intelligentsia and feminist activists might have responded to her utterances. Of course, she might not have been targeted the way she's been now, and therefore the media too might not have blown her up, and nobody would have known about her.

I am not suggesting that Taslima should have pretended to be a staunch believer. I am merely pointing out that the existence of devout Muslim women who also are asserting some of the radical opinions that Taslima has been proclaiming doesn't get to be known very widely. And in all fairness, their voices too deserve to be publicised. Like some of the women interviewed in Anees Jung's recent book, *Night of the New Moon (1993)*: Says Tayeba Begum who runs a madrasa in Bhopal: "When our men isolate women, divorce them without reason, they are going against the spirit of Islam". Saleha, a teacher in a convent school, wears no burqa and asks: "Why should I pray and fast out of fear? Am I less of a Muslim because of it?" And there's Wajida Tabassum who writes Urdu fiction, and songs and scripts for Hindi films. (Her latest song is something about lovers bathing together in the rain.) She claims that she writes about the injustices she sees around her and gleefully admits that her books are banned in polite circles. "Once a bearded mullah told her that no decent person could read her books. She turned back and asked him 'Why do you with your big beard read them?' "

Wajida appears to be a curious mixture of the traditional and the radical. She has not missed a single namaz since the age of eight but she doesn't wear purdah because she regards it as un-Islamic. "She sees no conflict between the Islam she swears by and her aggressive modernity". Her explanation is that the one is inherited and the other is created—"by our own experiments with truth". Friend Wajida says she has her own equation with Allah.

One is thankful that the media, the mullahs and the BJP haven't made a Taslima out of Wajida. The point is that there are Taslimas and Taslimas. They reject what they regard as unfair. Some are believers, some are not. But only the latter are publicised, and therefore hounded. And thus a stereotype is born, of the bold, brassy blasphemist. Against which is juxtaposed another equally pernicious stereotype: the silent, docile Muslim woman, inevitably burqa-clad, palms eternally facing upwards in prayer. The reading public rarely gets to know about those flesh-and-blood Muslim women who are quietly asserting their autonomy or energetically working for change from within.

Indian Elderly: Asset or Liability

K S James

Since our country is anticipating a further breakthrough in fertility and mortality front, the proportion of elderly is likely to go up in the coming years and so will the problems related to it We need to evolve programmes to deal with these emerging 'grey' problems

ARE elderly an asset or a liability? If the answer to this question is the latter, there is a justification for the mounting concern regarding their problems as the percentage of elderly in India is on a rise On the other hand, if the answer is the former this asset needs to be utilised in a proper manner for an optimum benefit This is because according to census figures the percentage of elderly in India has risen from 5 6 per cent in 1960 to 6 3 per cent in 1980 and is projected to be 7 2 per cent by 2000 and 9 5 per cent by 2020 This proportion also records a wide ranging variations across different states The main reason for an expanding elderly population in the total population is attributed to declining birth rate and improved mortality conditions Since our country is anticipating a further breakthrough in fertility and mortality front the proportion of elderly is likely to go up in the coming years and so will the problems related to it

In this context Social Development Section of the Economic and Social Commission for Asia and the Pacific (ESCAP) United Nations Bangkok, commissioned a study on Assistance in the Development of Comprehensive National Policies on Aging in India Life Long Preparatory Measures including Social Security This study was carried out under the co ordinatorship of S Irudaya Rajan along with U S Mishra and P S Sarma of the Centre for Development Studies Trivandrum A national seminar on Aging and Society was held on June 15, 1994 at Centre for Development Studies (CDS) organised by CDS in collaboration with the ESCAP Bangkok to disseminate major findings conclusions and recommendations of the study

K K Subrahmanian in his welcome speech commended the young researchers of CDS for taking up such a challenging study which opens up a fresh outlook on varied aspects of elderly in India In her inaugural address Lakshmi N Menon, former minister of state for external affairs, protested against the attitude of society towards elderly considering them as liabilities of the society There is nothing called old age according to her because even at the age of 90 one may feel young at least in one's thinking Even the so-called old age defined by age is a natural phenomena and is a blessing Hence the need of the hour is to educate the children from very young age to respect and honour the old people

K C Zachariah in his presidential address hinted the need for more studies regarding the problems of elderly as population grows older (i e, through an apparent imbalance in the age structure of the population) as a consequence of demographic transition The problem is more acute in states like Kerala and is likely to become severe in future years Not only do Kerala's equation of birth and death rates enhance its elderly population but the return of emigrants from Kerala in old age also add to the state s greying scene

Introducing the seminar, S Irudaya Rajan spoke at length about the project This project forms a part of an overall study carried out in four South East Asian Countries of the ESCAP Region—China Korea, Thailand and Singapore He informed the audience that there were two high level meetings held one at the United Nations headquarters in Bangkok, Thailand and another at the China Aging Research Centre Beijing, China to design the major aspects of the study He also broadly outlined some of the findings of this study There are instances when the parents proclaimed that they benefit more from their daughters than sons and would like to stay with daughters in the old age even in such a traditionally son preferred rural society of India A decline in the respect towards elderly from the younger generation is very evident from the respondents of this study Though the family is virtually the ideal place to stay in old age some of the respondents staying in old age homes definitely do not like to go back even at the invitation of sons or daughters

The preliminary report submitted to the ESCAPE Social Development Section United Nations Bangkok, contains eight chapters The organisers of the seminar had divided their report into three major sessions and the last session being completely devoted to discussing the major recommendations of the study with the panel of experts The first session was chaired by K C Zachariah with P N Mari Bhat and Alaka Basu participating as discussants The first three chapters of the report were presented by S Irudaya Rajan U S Mishra and P S Sarma, respectively, in the first session

Initiating the presentation, Irudaya Rajan briefly spoke about the three chapters in detail demography of aging review of studies pertaining to elderly persons and policies and programmes pertaining to elderly Other than presenting a review on the studies regarding elderly and the safety net available in India, the notable and interesting element in the session was the state level projections made by the researchers at the Centre for Development Studies, to gauge the magnitude of elderly population in the country for the coming years, specially from 1990 to 2020 As the age structure of the population is not available from the 1991 Census, the authors have estimated the age structure for 1990 based on a more realistic fertility and mortality assumptions

It is observed from the projections that the percentage of elderly persons in India will be 7 2 in 2000 and 9 5 in 2020 as against the 6 3 in 1980 In absolute terms the elderly account for 53 47 million in 1990, 71 million in 2000 and 124 million in 2020 respectively The medium age of Indian population is also expected to jump to 28 years by 2020 from 20 years as of 1980 which exemplifies the drastic imbalance in the age structure in coming decades

Among the states Kerala recorded the highest proportion of elderly as of 1990 while the lowest proportion was in West Bengal Kerala is likely to maintain its lead even in 2020 according to the projections and the percentage of aged is expected to rise more than 15 per cent, from its 1990 level of 8 10 per cent Tamil Nadu will have the second highest proportion of aged by 2020 (13 65 per cent) The lowest proportion by 2020 among Indian states will be in Uttar Pradesh with 6 88 per cent

Currently the highest number of elderly is found in Uttar Pradesh with eight million, followed by Andhra Pradesh and Tamil Nadu with 4 million each Today, Kerala has 2 3 million elderly which is expected to multiply two-and a half times by 2020 India will have 47 million old old (aged 70 and above) persons by 2020 The highest number of old-old is expected to be in Uttar Pradesh (7 million) followed by Maharashtra (5 million)

In the Indian scenario the sex ratio of the aged persons (60 years and above) favours males but among the old-old persons (beyond the age of 70) the sex ratio becomes favourable to females establishing the higher incidence of widowhood among aged females

As of 1990, the growth of elderly is slightly higher than the general growth rate of population whereas in 2020 the growth rate of the elderly is projected to be one-and-a half times higher than the growth rate of the population Four fifth of the total elderly are found in rural areas and the remaining live in urban areas Males are expected to live 16 years beyond age 60 and 10 years beyond age 70 and the corresponding years for females are 17 and 11 respectively by 2020

The authors spoke about the social and economic situation of elderly as revealed from the census The literacy rate among Indian elderly is estimated as 7 89 per cent as of 1981 However a wider differential was observed with regard to residential background with 4 44 per cent in rural areas and 26 2 per cent in urban areas Rural women folk among elderly recorded a literacy rate of 4 per cent The literacy rate among elderly was highest in Kerala and lowest in Rajasthan for both males and females While 32 85 percentage of elderly women in Kerala was

literate the corresponding rate for Rajasthan was only 2 75 per cent in 1981 Among the elderly women 64 3 per cent are widows against 19 4 per cent of widowers as of 1981 Among the extreme elderly (70 years and above) around 80 per cent are widows compared to 27 per cent of widowers

There has been a decline in the work participation rate of elderly in India between 1961 81 However the figure was still remarkably high with nearly 70 per cent of males in rural areas and 50 per cent of males in urban areas The female participation rate was 16 per cent and 7 per cent in rural and urban areas respectively The majority of workers among elderly (90 per cent) work in agricultural sector where the concept of retirement is even unheard of The work participation of elderly was the highest in Madhya Pradesh and the lowest in Kerala There are more number of male elderly beggars compared to females The highest proportion of elderly male beggars is found in Madhya Pradesh followed by West Bengal whereas the lowest is in Tamil Nadu Around 42 per cent of men and 25 per cent of women among non workers are reported to be engaged in household duties and 25 per cent of male elderly are enumerated as rentiers or pensioners The highest proportion (55) of male pensioners are reported in West Bengal whereas the highest proportion of female pensioners are reported in Tamil Nadu

The authors have also presented the existing relevant studies on aging issues The demographic studies carried out in India are broadly in agreement thus projecting Kerala as the grey state in India with more proportion of elderly followed by Tamil Nadu and Punjab An earlier study on Kerala was carried out by the Centre for Development Studies for the Population and Development Section United Nations New York

Various small sample surveys conducted in rural India in general reflects a greater degree of financial insecurity among the aged and this insecurity is more pronounced in the case of females compared to males Moreover financial problems are more common among widows and among elderly in nuclear families The worries of the elderly are on two fronts one in relation to social strain and the other on economic dependence The worries on social relation aspect are much more complex compared to economic worries for those who live in nuclear families or living alone

The majority of the elderly are reported to be suffering from diseases like cough poor eyesight, anaemia and dental problems The proportion of ailment among elderly is found to be increasing with advancing age and the major physical disability is in terms of blindness and deafness The prime reason for the aged moving into old age homes is due to the lack of proper care for them within family setup The present educated young elite express a greater degree of discomfort in the presence of elderly Also they have a large negative feeling about the behaviour, nature way of living and outlook of the elderly. Another study indicated the rural economic scene of the elderly to be miserable with majority of elderly households being below the poverty line

Analysts of India's social security programme measures have briefly commented on its limited coverage and the future likelihood of a more comprehensive social security system has been felt impractical in view of the nation's economic conditions and demographic trends The present coverage of social security is stated to be inadequate as it excludes around 90 per cent of the working population A strong feeling emerges in relation to the merging of social security measures with the anti poverty measures

During the Eighth Plan period, the outlay for social security and welfare expenditure is Rs 2 375 crore As of 1990 the government of India spends 1 34 per cent from the non plan expenditure and 1 15 per cent from the plan expenditure for social security and social welfare programmes

For understanding the social security system in the country the authors have concentrated the case of Kerala as an example for the other states to follow in the country Some features of the Kerala's social security system is worth mentioning As of 1993 there are more than 30 social security and welfare schemes implemented in the state of Kerala They belong to three categories schemes which are fully financed by the state, schemes which are financed partly with state support and schemes which are financed outside the budget and operated by the respective boards

In 1992-93 alone the state has committed Rs 80 crore which represents 2 77 per cent of the state revenue budget The overall coverage of all these schemes taken together is about 25 per cent of the total 60 plus population in the state Among the beneficiaries 80 per cent are from three major schemes such as the agricultural worker pension scheme and special pension for the physically handicapped and destitute and widow pension scheme

THE GREY STATE

Major issues raised in the Kerala case study are as follows There are complaints about wastage and overlapping in the major pension schemes Are the beneficiaries deserving cases? Is the assistance enough? The financial implications of social assistance and security schemes is expected to increase in the near future As of now the pension

commitment could not be met due to paucity of funds for Kerala How is the government of Kerala going to face this issue? It is interesting to watch and learn from the experience of Kerala for other state governments in India

Initiating a discussion P N Mari Bhat regarded that the problem of the elderly is not confined to any state as such The magnitude as well as the growth rate of elderly are very high even in the northern states One of the notable weakness of planning process in India according to Mari Bhat, is the overemphasis given to the growing population size disregarding its structure In this respect, the studies of this type revealing some realities on the situation of elderly in India is of great relevance Moreover, the state-level projections done by the authors are much useful for any planners in the country However such exercises should concentrate on extracting welfare implications In this regard the chapter on safety net for the elderly to certain extent failed to draw certain implication on continuing such policies Some countries like Japan, Sweden even spend nearly 20 per cent of its Gross Domestic Product for welfare measures Do we have to also follow the same? This is the question which remains unanswered Intervening the debate I S Gulati disregarded the view that the existing safety social security net work available is inadequate to meet the demand The real question is not how much we spent but how efficiently that is utilised Though there are several measures available for the welfare of the elderly the real benefit does not reach them Commenting on the point Mari Bhat emphasised that the states like Kerala should take an initiative for maintaining the more efficient social security system

Alaka Basu opined that the magnitude of elderly in the country should not be a worry to government Among them how many are poor who are unable to take are of themselves at old age should be emphasised In other words one has to remove the creamy layer from the total number and the policies should aim mainly at economically poor sections among them The second session was chaired by K Saradamoni and Leela Gulati, P K B Nayar and S Krishnakumari participated as discussants Another four chapters of the report were presented by S Irudaya Rajan, U S Mishra and P S Sarma The chapters are living conditions among elderly persons perception of elderly persons, life histories of elderly persons and re-examining he conceptual issues

As a part of this national aging project, the authors have conducted a National Aging Survey (NAS) among elderly in six major states in India, collaborating with the Gujarat Institute of Development Research, Ahmedabad (Pravin Visaria and Leela Visaria), Tata Institute of Social Sciences, Bombay (S Parasuraman) and Population Centre, Bangalore (P H Reddy) The states are Gujarat, Bihar, Maharashtra, Karnataka, Tamil Nadu and Kerala They have also conducted a mail survey to understand the situation of residential institutions of elderly in India In addition, a small survey among elderly living in old age homes in Tamil Nadu and Kerala has been carried out to observe their problems due to staying at old age homes Moreover, they have conducted fifteen life histories of elderly persons above 60 years of age in the states of Kerala Tamil Nadu and Orissa Along with that, five group discussions were undertaken in Kerala and Tamil Nadu to understand their needs

The National Aging Survey (NAS) indicates that with an increase in age the work participation among elderly declines However, there remains a greater degree of disparity in work status between sexes with more than half of the elderly males reported to be working as against 13 per cent females Among the surveyed working elderly around 80 per cent have been contributing to the household expenses Detailed investigation reveals that around 81 per cent of male working elderly are contributing to household expenses as against 72 6 per cent of females

HEALTH STATUS

The health status of the individual plays a predominant role in work status of the elderly On this aspect the NAS found that 45 50 per cent of those reported healthy or fairly alright seem to be working Remember this is self reporting by the individual himself The prime means of subsistence of elderly is reported to be co residence with children Means of subsistence reported otherwise are current work financial support by children elsewhere savings from the past work and pension etc

The NAS indicates a high proportion of female elderly living in single member households The headship status seems to be showing a declining proportion with increasing age of the respondent Interest-ingly, 51 per cent of widowed females reported as head of the household indicating that females takeover the headship after their husbands' death Definitely husbands absence make them independent in their course of life

With regard to opinion such as 'children are the main support in old age three fourths of the respondents irrespective of sex agree with the view of children being the sole caretakers in old age Regarding the preference to stay with son or daughter, most of them (70 to 75 per cent) favour sons as against any other choice However 50 per cent of males and 25 per cent of females are able to materialise their choice of staying with son in old age

The NAS indicates that 35 per cent of the surveyed elderly are reported to be having some or the other perennial health problems which seems to be more in proportion with increase in the age of the respondent Among the three major handicaps faced by the elderly handicap in vision seems to be prominent with one-third being victims of poor eyesight Ninety per cent of the respondents irrespective of sex stated that they had consulted a doctor in case of sickness and the most popular system of treatment preferred by the Indian elderly is the allopathic system of medicine With regard to the saving for old age, 42 per cent of the males and 32 per cent of the females perceive saving as essential for unproductive days in old age and such feeling is stronger among the literate ones

In terms of vegetarian and non vegetarian status, it is found that more of elderly females (36 4 per cent) are vegetarians as against only 22 per cent of males Also more and more are reported to be vegetarians at later ages in life At the same time an average 7 hours of sleep per day is reported by the surveyed elderly which too shows a declining trend with an increase in age As of 1989 there were 329 old age homes in the country The data indicates that 41 per cent of the existing old age homes and care centres started during the period 1951 75

The number of institutions for elderly care in Tamil Nadu and Kerala are higher than any other states in India As of 1989 there are 71 old age homes in Tamil Nadu and 70 in Kerala On the whole most of institutional care centres (57 per cent) are housed in the four south Indian states The proportion of new homes started in recent years are significant in Tamil Nadu and Andhra Pradesh

As expected, majority (57 4 per cent) of institutions are run by Christians in India Among the organisations run by religious identity, 93 per cent of them are run by Christian organisations Among the old age homes 68 per cent provide residential facilities where as only 6 per cent of them provide day care services for elderly in India As of 1989 15 471 elderly stay in old age homes in India

The information indicates that 67 per cent of old age homes provide the services free of cost for the inmates as most of them are run by religious institutions A survey also felt the need for more old age homes in future for the poor destitute sick and handicapped elderly In terms of facilities available in the old age homes 53 76 per cent enjoy residential doctor facility 27 96 per cent enjoy vehicle facility and 88 per cent have one or the other recreational facilities

A major handicap reported by the functionaries of the old age homes seems to be lack of finance which restricts them increasing the strength despite increasing demand for new entries Among the old age home inmates under study 46 per cent of them do not have a living son or daughter and prefer to live in old age homes Among the inmates who have children 74 per cent of them do not feel lonely or feel uneasy to live away from their children, relatives or friends This, to certain extent is an indication of elderly's bitter experience with living children

The most encouraging observation is that 91 per cent of the inmates are overwhelmingly happy about their stay in old age homes and on the service rendered Also 77 per cent of them are satisfied with the quality as well as quantity of the food served in the old age

homes Surprisingly only 4 per cent of the inmates are supported by children as against the common belief that children are the main support in old age Therefore,it is time that the government should seriously consider extending social assistance schemes for elderly irrespective of the number of living children

The major points emerged in the group discussion among elderly are outlined by the authors Opinions on meaning of old age, advantages and disadvantages of being old, preferred living arrangements, community involvement and need of elderly persons are obtained through these group discussions Though the discussion was aimed on the above lines the elderly participants opined on issues of reemployment, retirement age, inequalities in pension difficulty in obtaining benefits from social assistance schemes, suicide among elderly and euthanasia or mercy killing Opinions emerging from several groups varied widely depending on their characteristics and composition

The rural male elderly seem to be quite frustrated on the breaking down of joint family system Though all of their married children live closer (or in the same village), they are not interested to take care of aged parents On defining old they attribute declining health status and restrictive activity pattern to be the major criteria The rural elderly are against the chronological cut off point of 60 in considering one as old One participant stated categorically, 'for us, only one retirement, not from work but from this world'

Some of the participants boldly proclaimed that they get more benefits from daughters than sons though they spend more money on sons compared to daughters On family, rural male elderly informed that they have done enough for their children but they are not reciprocated with any benefits On programmes designed for elderly, the males felt that they are discriminated by the government Demand was made for widower pension as like widow pension Most of the participants are for universal pension On expressed needs of elderly persons, the first group devoted their attention for universal pension, free transport and medical facilities

On governmental assistance such as widow pension women raise objection against the discrimination in providing pension only to those widows who have no son They maintained that pension should be made universal, irrespective of their number of surviving children and their sex composition All of them strongly felt the necessity to enhance the retirement age up to 65 years in Kerala because of longevity and late entry into labour force and late marriage Most of them took almost 10 years after the official retirement to complete their sons education and daughters marriage

About the expectation from the society to lead a happy life in old age the main demands were pension, free medical check-ups and transport facilities and if possible 10 kg rice per month through public distribution system (PDS) Some of them also expressed need for a credit system in the public distribution system because the availability of food grains in PDS and the date of pension never matches to buy the materials With regard to the old age home being an alternative place of stay in old age in case of lack of familial care, none agreed on institutional care as an alternative to the home environment

Preparation for old age was conceived with regard to finance and health among males whereas female participants indicated a sound kith and kin relationship to be another life preparatory measure The rich urban elites strongly felt that the emotional suffering is the prime problems at later ages because they lose most of their near and dear ones, friends and close associates day by day

The case studies carried out as part of this study also provide some interesting observations 'It is better to be in old age homes in the company of contemporary persons by sharing love and affection rather than staying alone with certain disability'— a widow In sum, along with god's grace, life preparation at younger ages such as education, health and finance, commitment, self-discipline, clean habits, self confidence and hard work can make one's old age happy and charming and become an asset to the household and society

Though beggary is considered to be a most disgraceful activity, it is a gainful activity for the beggar and the beggar gets returns without any investment. Beggary remains the only alternative for survival for the leprosy diseased elderly persons, stated a widow beggar from Orissa. Old age home is meant for those without children. Whatever may be the situation, this is our right to stay with children because we brought them up, argued the separated old woman.

The authors of the report have extensively discussed the definition of old age. It is felt that the cutoff point for determining aged should be in accordance with increasing life expectancy. Based on this logic, it is argued that a finite expected number of years of survival beyond an age should be the cutoff point to designate as old.

In a similar manner it makes a case for revision in retirement age to ensure a finite number of working years for all. Given the late entry in to the workforce and increasing expected years of survival, there should be a revision in the retirement age in accordance with increasing life expectancy in general and females should be given due advantage in this regard for their prolonged years of survival in the disadvantaged status of widowhood.

The conventional dependency ratio calculation considers all aged 60 and above to be dependent and at the same time some of them are reported to be working too. Hence it needs a revision to get the exact extent of dependence burden by considering only non workers above the age of 60 years. Again among the non workers those doing household duties, beggars and in rentier pensioner category cannot be considered as dependent for their being economically productive. Hence the revised set of non workers by excluding the above said three categories of non workers should be used to assess the exact extent of old age dependence.

The discussion on the second section is initiated by Leela Gulati asserting that there is no alternative to family to solve the problems of elderly. Naturally more information is needed to know the intra-family mechanism. How expensive is to take care of an elderly in a family? This should be found out to formulate genuine policies for the elderly. She is also sceptical regarding the validity of drawing conclusion from case studies. Case study should be confined to draw certain information that a usual survey cannot provide.

P K B Nair does not have a different view regarding the importance of family in taking care of elderly. He also suggested some other measures such as strong counselling to release elderly from loneliness and prepare them to live a healthy old age life. Krishna Kumari argued that nearly all couples need the help of elderly in the family. However, the requirement vary during different life cycles of the couples. Therefore, a better means to comprehend the elderly problem is to understand that life cycle in which the elderly are least demanded so that the policies can be formulated to supplement the expenses of keeping them for that life cycle.

A strong view emerging from the discussion was that the problem of the elderly is more psychological than material. This is because the economic problem is associated with all stages of life. The feeling that originates in old age is the feeling that we are unwanted which is more disheartening. Consequently, the real solution to the problem of elderly is to organise themselves to fight for their rights, to chalk out strategies to solve their problem and thereby relieve form the loneliness.

The concluding session focused mainly on the recommendation of this study for the policy action and was presented by S Irudaya Rajan. The following recommendations are made and discussed in the seminar. The Census of India should seriously consider in preparing special tables on aged persons as they do for scheduled castes and tribes. As of 1991, India has 54 million old people and they need special care like scheduled castes and tribes.

This study recommends the constitution of a national committee on aging in the Planning Commission together with a separate ministry with a minister dealing with the aging affairs in the country. Also unlike other countries in the world, a National Aging Centre should be started to prepare inputs related to the problems and prospects of the elderly for discussion in planning forums. A demand must be made for more user friendly transportation services through giving special concessions (in terms of free or subsidised fare and seat reservations) in availing transport services to the elderly as vulnerable group like women and children. With regard to health services, geriatric specialists for treatment of the elderly, special wards for inward treatment as well as separate system to meet the doctor are proposed. To compensate the sudden dip in income level of elderly immediately after retirement there should be some provision of reemployment for those willing or otherwise to encourage them for self earning. Elderly should be exempted from income tax. Required aid should be provided to old age homes by the government for smooth running. Also all efforts should be made to have charitable homes for the poor.

The National Aging Survey (NAS) group discussions and case studies have clearly pointed out that elderly face mostly three types of handicaps: hearing, seeing and walking and most of them have problem in hearing and seeing. These two handicaps can be rectified through eye glasses and hearing aids. Ministry of Health along with NGOs should plan something for the elderly such as providing free glass and hearing aids.

As the general feeling is that old people are liabilities and for which they are very often neglected in family setups, efforts should be made with regard to provision of family incentives to those families who have an elderly. For instance, an income tax exemption for those who stay with an elderly. As this proposal remains limited to the elite class, financial incentives can be extended in poor and barely sustainable households through provision of necessities in public distribution system.

The government of India should introduce an identity card for elderly to be in the part of social security system. The Ministry of Welfare, New Delhi should make provisions for an identity card for all elderly persons for implementing various social security schemes. All the social assistance schemes such as old age pension, making identity cards for elderly to obtain free services in transport, priority in housing and hospital facilities and some incentives through public distribution system should be handed over to the elected panchayats in the country. The Panchayat Raj and Nagar Palika Bill have an appropriate role to play in shaping the elderly in the future. Social assistance schemes such as widow pension should be made universal rather than selective. The government should take serious steps to enhance the retirement age to 65 years, and also to have differential retirement age by sex. The Life Insurance Corporation of India should introduce schemes to insure all citizens in the country so that they can get some financial and medical support in old age. The department of women and child development should finance research on older women and widows. Almost 70 per cent of the women aged 70 and above are widows in the country. They should recommend certain policy measures to improve the elderly women in general and widows in particular. For instance they should lobby for universal widow pension throughout the country.

The discussion that followed on the recommendation doubted the benefit that might accrue to elderly through the suggestion on reducing income tax to those who stay with them. Saradamoni suggested the authors to specify clearly what data are needed to have more information regarding elderly form census.

Finally as the seminar concluded everybody was aware of the impact of demographic change on the creation of a different dimension of problems in the coming years. There was no difference of opinion that this problem should be handled at its infancy so that in the coming years we will not end up in groping in the dark. Furthermore, an optimism was visible in all faces confirming that if manoeuvred carefully, elderly indubitably becomes an asset to the society.

Terrorism: Past, Present and Future

Robi Chakravorti

The practice of terrorism has a long history. A universally acceptable definition of terrorism as a specific form of violence is difficult to evolve.

TERRORISM like democracy and human rights, is one of the terms frequently appearing in the media today. It would be difficult to define it precisely and clearly in a few words distinguishing it from other types of violence. A book on the subject (*Political Terrorism* by Alex Schmid, 1983) listed over 100 definitions of the term. To give another example, different government agencies in the US have produced different definitions of the term. A list of definitions by different US government agencies described in a newspaper article ('Terrorism—A Term Notoriously Difficult to Pin Down' by Rushworth M Kidder, *Christian Science Monitor*, April 18, 1986, p 12) included samples from the US department of defence, FBI, state department, department of justice and the vice president's taskforce on combating terrorism. As one goes through these definitions three words are repeatedly used in different orders. 'Coercion' and 'intimidation' are used in four definitions, one definition mentions 'non combatant targets', another one 'civilian population'. The term 'unlawful use of force or violence' is used in three definitions. These three words—coercion, intimidation and non combatant targets—highlight the main problem of a proper acceptable definition of terrorism as a specific form of violence and its shifty use by parties either criticising terrorism or defending such acts. If the term 'unlawful' is included one will have the additional problem of treating cases of the establishment approved acts of coercion and their liaison with unlawful elements in society in the past and contemporary times.

To begin with if we take the terms coercion and intimidation as primary indices of terrorism there is no human group or country in the world which never used some form of coercion and intimidation to forge stability in the crucial stages of its socio political formation. As the group expanded from small tribes or sects to the modern forms of nation state these two features of terrorism were often used with different styles of justification. As some nation states became stable and then tended to expand their power and influence outside their territories they used coercion and intimidation. If we trace the origin of the term it comes from the latin word *terrere* to frighten. The English words terror and terrible have the same origin. If we use the original meaning of the term terror has been used regularly as a technique throughout history to maintain power and enforce policies by arousing fear in the ruled.

From this viewpoint, we can divide the history of its practice in three categories: establishment, anti establishment and criminal professional. The objective of establishment terrorism is social solidarity through enforced compliance. It consists of rituals of violence in support of establishment values and norms. They symbolise a kind of propaganda of punishment for violation of norms and sacrifices for their preservation. Several illustrations of this type of terrorism can be cited such as the burning of women as witches under Christianity and of suttees in parts of Hindu India, including amputation of body parts practised by some Islamic countries and public hanging or lynching of people under the aegis of constitutional secular governments.

Some of these modes of terrorism are still practised in several societies and the political systems where these forms are obsolete today had practised them in not so distant past. American Indians were scalped, Joan of Arc was burned at the stake. British conduct after the sepoy mutiny in India involved acts such as blowing mutineers with field guns. In the US after the slave insurrection of 1811 heads of 16 slaves were displayed on poles at intervals up the Mississippi river as a warning to blacks.

Perhaps the best example of anti establishment terrorism is the Jacobin reaction to the French monarchy during the French Revolution. A modern version can be the actions of the Khmer Rouge in Cambodia. The conceptual distinction between the establishment and anti establishment types of terrorism looks categorically neat but may obscure the complexity of the process of consolidating and legitimising authority after forcible changes in regimes. This is an interesting area for studying terrorism as a form of violence which has been used both by the votaries of establishment and their opponents holding different ideologies throughout history. Once an establishment is in place whether a tribe in the past or a nation state in contemporary history the terror used during its formation is usually either obscured, played down, recapitulated in romantic terms or reviewed as *ex post facto* historic documents.

To give an illustration from US history the introductory commentary written by journalist Harrison Salisbury to 'A Report to the National Commission on the Causes and Prevention of Violence' entitled *Assassination and Political Violence* (1970) pointed out, "The use of violence or terror by the state, be it a medieval kingdom or barony or a contemporary military or political dictatorship, is so customary that it almost goes without note" (p xxi). As for the democratic US, Salisbury noted that 'violence has marked every step of the creation and building of the American society'. The commentary gives the examples of the vigilante law—the law of summary justice enforced by the mob and lynch law—the law of summary terror also enforced by the mob. Both were illegal but they were American institutions as sanctified by practice and custom as the law of constitution, the courts, the judges' (p xvii). An interesting side-note on this type of terrorism is provided by another writer, Richard Maxwell Brown (*Strain of Violence: Historical Studies of American Violence and Vigilantism*, 1975) who quotes US president Teddy Roosevelt's support of vigilantism in the US and of the imperialist actions by the British against Egypt, French against Algeria and Russians against Turkestan and his own presidential actions against Panama (p 163).

This description of the role of violence and terrorism during the consolidation of a political system brings to attention what can be described as the third type of terrorism—criminal professional. Two simple examples of this type are the mafia today and thugs in India in the past. Although this type of terrorists can be described as non political in their objectives they can often have links with establishment or anti establishment acts of terroristic violence. The mafia is still powerful in Italy. When the government recently tried to crack down on the mafia criminal gang members murdered two anti mafia judges and gunned down a priest in church. Daniel Bell, in a chapter in his book *The End of Ideology* (1962) entitled 'Crime As An American Way of Life' gives a sophisticated account of different gangs associated with ethnic groups and their linkage with the US business and political interests.

There are studies of the relationship between gangsters and politics in the US and other countries, but this interesting area still remains relatively unexplored. *Gangsters and Revolutionaries* by Robert Cribb (1991) presents a detailed document based account of relationship between gangsters and young left wing nationalists during the Indonesian national revolution (1945-49). According to this study, many successful rulers overcame the problem of maintaining the relationship with such unlawful elements by incorporating them in official roles such as local headman in exchange for acknowledgment of the ruler's broad authority and promise to regularise their depredations. The relations between the

gangsters and state authorities, however, tend to oscillate between the poles of recruitment and selective acts of suppression. This is an interesting area for studying certain unknown and unspoken dimensions of political machinations.

The criticism of terrorism in the western media from the 1960s onwards until the collapse of the Soviet government focused mostly on communist terrorism. The target of contemporary attention has shifted to a selective, odd collection of people engaged in acts of violence in different parts of the third world demanding some groups' rights of self-determination, the idea of which received international recognition after the first world war. The violence generated by this idea can be described as a form of secular religion which has become popular as the Marxist idea of global class consciousness did not work out the way it was meant to. Perhaps the most graphic way to describe this development is to rephrase a comment made by Julien Benda in his *The Treason of the Intellectuals* (1969). "Political passions", he wrote, "are now centred on material incentives for a group like the state, country or class and they are 'divinised' into ideologies. The state, country, class are now frankly god; we may even say that for many people (and some are proud of it), they alone are god" (p 39). With the decline of the pull of the ideology of the working class consciousness on a global scale, one can argue that the country and the state have now acquired dominance as a secular version of god.

Another way to get out of the definitional problem often distorting our analysis of terrorism seen in contemporary and historical perspectives is to separate it from other types of violence which have plagued human history. This can pose a problem, too, since one type of violence seen as an ideal-type category may look analytically distinctive, but may not be so in real practice. Inter-state war, distinguished from terrorism, is supposed to involve battles between organised armies, but in recent times it has involved indiscriminate killing of civilians. The analytical division between terrorism and other types of violence, is nonetheless pedagogically important for understanding the contaminating role of the concept of terrorism in contemporary times.

Categorising Terrorism

The simplest way to categorise terrorism as different from other major types of violence that has marked human history is to distinguish it from assassination, regular war, and guerilla war. Communal riots are a separate type of violence in the sense that they generally involve collective behaviour not organised behaviour. While the goal of communal riots can be the same as that of organised acts of terrorism, this species of violence can be treated as a separate category. On the other hand, there can develop a planned or unplanned connection between all these four types of violence. As one type of violence spreads, other types may follow, not necessarily in a unilinear fashion.

When we contrast terrorism and its various definitions with these three other forms of violence, we usually stress the presence or absence of two characteristics—discriminatory use of violence aimed at specific targets accused of immoral acts and the relative immunity of non-combatants or civilian population in general. Terrorism ignores the discriminatory use of violence and the difference between the combatant and non-combatant sections of the population. In the past, the targets of assassination, regular war and guerilla war used to be selective and clear-cut and if violence spilled over to non-target or non-combatant areas of the conflict, it was either regretted or explained away as unintentional. Assassination attempts in the past, for example, were aimed exclusively at specific individuals seen as symbols of evil and carefully avoiding non-target persons. There have been cases when the assassin did not carry out the task because it might hurt other people, or regretted the accidental death of wrong or innocent persons in the target area. Recent acts of assassination do not always observe these limitations.

One interesting point about the history of assassination is that the victims have often been the advocates of peace. Lord Buddha was the target of unsuccessful assassination plots. Mahatma Gandhi and Martin Luther King were assassinated. Count Folk Bernadotte who went to west Asia as a UN mediator to work out a peace formula was assassinated in September 1948 by a Jewish terrorist gang. Western countries, too, have been the scene of frequent assassinations. According to an account (*Assassination and Terrorism* by David C Rapoport, 1971), during the period between 1865 and 1914, in Europe "one head of state or major minister fell nearly every eighteen months" (p 6).

An American report on the subject, mentioned earlier (*Assassination and Political Violence, 1970*) presented data in support of the thesis that the US ranks relatively high in frequency of assassinations even when the data are adjusted for population size (p 160). The sets of data presented covers 50 years between 1918-1968 and another about 20 years between 1948-1967. In terms of the 50-year data, the US ranks second among six countries with population over 100 million. In terms of 20 years data, it ranks first.

The strategy of war nowadays involves killing of non-combatants or civilian population on a large scale and this has posed a moral problem for the superpower US whose war strategies in Vietnam involved widespread destruction of non-combatant population. Such acts are either hidden from public notice or when revealed are justified on strategic grounds and cosmetised by language such as 'collateral damage', 'surgical strike' or 'compellance', a new term coined by the Pentagon to justify air-strikes. 'Compellance' is described as 'strategic coercion'. Conservative columnist William Safire who once worked as a speech-writer in the White House used a sophisticated word-game in describing it as "the use of air power to persuade by punishment". "The purpose of the tactics is a sudden infliction of 'national pain' involving shutting down of electric power, fuel supplies, putting a missile in war ministry" (William Safire's column in *New York Times*, April 19, 1993, entitled. "The Case for 'Compellance' "). The term may be used in future to justify some future acts of violence singularly aimed at the civilian population.

Terrorism as Tactic

Terrorism as a tactic for the political objective of domination seems to have begun along with the escalation of regular warfare from 'gentleman's war' to 'total war' in modern times, then spread to areas of conflict related to different types of 'liberation' struggle, ranging from demands for populist self-determination to national self-determination. Populist self-determination encompasses violent movements based on the ideals of liberty, equality and fraternity; national self-determination refers to the secessionist movements threatening to break up the territorial arrangement of nation-states.

War in the European continent at one time followed the convention of avoiding hurt to non-combatant civilian population. "During all the wars of Napolean, not a single town was destroyed deliberately by his troops. When the Prussian army besieged Paris in 1870, it refrained from indiscriminate shelling of the city" (*The Uses of Comparative Sociology* by Stanislav Andreski, 1969, p 112). This was the European tradition in the 19th century. The Romans and the Greeks in the past had fought in a brutal manner affecting non-combatants. Assyrians and Mongols often committed genocide to terrorise enemies. The politico-religious war that shook up central Europe between 1618-1648 called the 'Thirty Years War' deserves special mention in this context. Its direct and indirect results involved the death of one-third of the population in the areas of conflict. Its ideological effects were the decline of the rule of religion and the emergence of the 18th century worship of 'nature' and 'reason'.

Terrorism as a tactical part of regular war strategy was officially introduced in modern

times during the civil war in the US according to an account presented in *Nationality in History and Politics* (1966) by Frederick Hertz. According to him, a step towards what is called today as 'total war' was made in the civil war in America. Democratic north in the civil war took lead in this new type of warfare while the south clung more or less to the old concept of a 'gentleman's war'. "In the Franco-German war of 1870-71, the American General Sheridan visited Bismarck and stayed with him behind the German lines for some time. Once when the question of humanity of war was being discussed, and a high Prussian official was advocating humane methods, Sheridan dissented and said it was advisable to treat the population with the utmost vigour. It was an aim of strategy to cause the inhabitants so much suffering that they must long for peace and force the government to demand it. The people, Sheridan remarked, must be left nothing but their eyes to weep with. This observation pleased Bismarck" (p 231). The above report was quoted from *Bismarck, Some Secret Pages of History* by Moritz Busch (1898).

Terrorism is different from assassination and guerilla warfare. The target of assassination is generally an individual. It is an occasional, passing act whereas terrorism is a process aimed at a system. From the terrorists' viewpoint, the guilt or innocence of individuals in a group which is the target of attack is irrelevant. This viewpoint distinguishing terrorism from assassination and the old-fashioned 'gentleman's war' is best described in colourful language in an extremist statement quoted in *Assassination and Terrorism* by David C Rapoport (1971). Rapoport quotes an American Ku Klux Klan gang member's statement about indiscriminate bombing which killed some black children: "When I go to kill rattlesnakes, I don't make no difference between little rattlesnakes and big rattlesnakes because I know it is in the nature of all rattlesnakes to be my enemies and to poison me if they can. So, I kill 'em all, and if there's four less little Niggers tonight, then, I say, good for whoever planted the bomb" (p 42).

The term guerilla used in guerilla warfare came from the Spanish origin, meaning 'little war' and people engaged in it in the traditional sense can be seen as small-scale warriors aiming at the establishment's conventional forces for piecemeal destruction. According to a history of guerilla warfare (*War in the Shadows: The Guerilla in History* by Robert B Asprey, 1975), its use stems from the Duke of Wellington's Iberian campaigns (1809-13) when Spanish-Portuguese irregulars or 'guerrilleros' (also referred to at the time as partisans or insurgents) helped drive the French from the peninsula (p xi, vol I).

Compared to the guerillas in this sense, the terrorists are not soldiers, but civilians. They generally avoid direct face-to-face confrontation with conventional forces. Sneaky attacks against conventional troops or their managers, however, form part of terrorist tactics. The above distinction between guerilla warriors and terrorists may pose a problem when we note that the participants in a long-standing terrorist organisation describe themselves as the Irish Republican Army and the reports of guerillas in Latin America killing or torturing civilian population accused of supporting or harbouring what they consider as enemies.

While the analytical distinctions between terrorism, assassination, regular war and guerilla war described and illustrated above are important for an understanding of terrorism in relation to other types of group violence, there is often one element common to all these four types of violence which can sometimes be interrelated. This element can be labelled as "the propaganda by the deed" which Russian anarchists of the 19th century supporting terrorism is reported to have used (*The Morality of Terrorism: Religious and Secular Justifications*, edited by David C Rapoport and Yonah Alexander, 1989 (p 15)).

As we survey the history of terrorism and other forms of group violence, it is clear that terrorism in one form or another was used all over the world and continues to be used even today. It is questionable, however, whether terrorism alone as a strategy can lead to the overthrow of a regime. Walter Laqueur, the author of *The Age of Terrorism* (1987) argued in an article in the *Harper's Magazine* (March 1976), entitled, 'The Futility of Terrorism' that "There is no known case in modern history of a terrorist movement seizing political power, although terror has been used on a tactical level by "radical political parties" (p 103). The second part of the statement labelling the "radical political parties" alone as having used terror on the tactical level is wrong; it is an example of political bias in many scholarly studies of terrorism. Laqueur ignores the 'tactical' use of terrorism by parties other than the radicals.

James Reston, the columnist of the *New York Times*, in an editorial page article (July 22, 1987) entitled, 'File and Forget?' listed some CIA undercover activities which included the blowing up of an Indian Airlines plane that was supposed to carry Zhou En-lai to the Bandung conference in 1955. He, also, mentioned charges of assassination attempts on Fidel Castro of Cuba and Patrice Lumumba of Congo. Selective use of terrorism and assassination as illustrated above, as a tactical part of a broad strategy may yield results. We can describe this as systematic terrorism different from unorganised terrorism. Systemic terrorism can form part of the intervention strategy by a big power or a tactical part of a broad social movement or expressive symbols of militancy as

warning signals by both the proactive and reactive forces. It is questionable, however, whether terrorism as the main element of strategy can lead to the overthrow of a regime.

Another question about terrorism is its destructiveness compared to other forms of violence. An illustrative sample of destruction caused by different forms of violence shows that terrorism alone does not anywhere match the range of destruction caused by regular war, guerilla war and communal riots. Guerilla war in Vietnam and Cambodia escalated into regular war and turned into massacres of civilian population. Likewise, anti-Soviet guerillas in Afghanistan became engaged in indiscriminate killing in the style of modern-style, well-armed and well-organised communal rioters. Communal riots in the past involved simple tools like sticks, stones, knives, spears and swords. Now, guns and bombs, even missiles are used.

One exception to the above note on the limited human loss caused by terrorist activities alone is perhaps the situation in Ireland. A study on the subject claims that between 1969-1975 the number of fatalities in Ulster relative to its population was twice the losses suffered by Britain in the Boer War and about twice the number of deaths absorbed by the US forces in the Korean and Vietnam wars (*Northern Ireland: A Time of Choice* by Richard Rose, 1976, p 27). The phrase, 'relative to the population', is italicised so that the human costs of terroristic acts in Ireland are not compared in absolute numbers with the war costs cited.

A book entitled, *The Paths to Domination, Resistance and Terror* edited by Carolyn Nordstrom and JoAnn Martin (1992) presents startling figures about 'wholesale genocide of tribal peoples" in the last century estimated to be about 50 million. These figures are seldom included in war-related casualties (p 9). A report of the Independent Commission on International Humanitarian Issues (1986) quoted in the above book claimed that there were at least 150 wars since the end of the second world war resulting in the death of approximately 20 million people (p 19).

The proportion of civilian casualties compared to battlefield deaths has increased dramatically, according to some data cited in the above book. In the first world war over 80 per cent of battlefield deaths were soldiers, by second world war, half of the casualties were civilians while today nearly 90 per cent of war-related deaths are civilians. 'It may safely be said that the least dangerous place to be in a war today is the military' (footnotes 1, p 271). Harold Isaacs in his *Idols of the Tribe* (1975) presents startling data on communal riots between 1945-1967 including two million deaths during the partition of India and creation of Pakistan, 1,00,000 Chinese killed by Indonesians and 35,000 Khambas killed by Chinese in Tibet, 2,00,000 Watusi and Bahutu mutually slaughtered during the separation of Burundi and Rwanda (p 3). If we add the number of recent casualties in Rwanda the number of total deaths in the region due to communal slaughter can be doubled. These illustrative examples show that terrorism defined in a narrow sense as occasional acts of violence against civilian targets is not as destructive compared to regular war as developed by the western powers, guerilla warfare with modern weapons as exemplified in Afghanistan and communal conflicts with modern destructive weapons in different parts of the world.

One area of terrorism which has not yet been practised, however, poses a serious danger in future. This can be described as nuclear terrorism involving use of nuclear material or sabotage of nuclear plants. Likewise terrorists can also use equally lethal weapons such as chemical or biological poisons to cause disaster. Several years ago a Ford Foundation report drew nightmare scenarios of what a few terrorists can do with a small amount of poisonous plutonium. The *Wall Street Journal* in a recent front-page report (May 11) hinted that the theft of bomb grade plutonium or uranium from countries with nuclear facilities can lead to secret manufacture of nuclear bomb in a short time. 'Builders with raw material could have less need for scientists and a ten-year project might be cut to 10 months." Since plutonium is often used in nuclear reactors, it can be stolen or waste plutonium can be recycled to construct a nuclear device. Strategic long-range nuclear weapons are difficult to steal and transfer, but tactical nuclear weapons with limited range and impact can be stolen and shipped. The *Manchester Guardian*, in a recent issue (May 29), reported that the US administration could not account for up to 1.4 tons of plutonium, enough raw material for 300 nuclear weapons. What makes nuclear terrorism potentially disastrous is its possible use by madmen rather than goal oriented political terrorists. A report by investigative reporter-columnist Jack Anderson nearly 20 years ago ('Will Nuclear Weapons Fall into the Hands of Terrorists?', *Parade*, September 29, 1974) gave an interesting scenario of this possibility in an incident involving a 15-year-old Florida boy who threatened to incinerate a city unless he was paid one million dollars. His demand was backed up with a 'technically good' drawing of a nuclear weapon. The city was ready to pay until the Atomic Energy Commission decided that no fissionable material was missing from the nuclear plants and therefore, the boy could not produce a bomb.

While the concern for the terroristic manufacture and use of nuclear weapons in the context of the current issue of nuclear non-proliferation can be valid, one should not forget the historic fact that the only country which has so far used its nuclear arsenal is the US. Over 1,00,000 Japanese were killed by the atom bomb dropped on Hiroshima and Nagasaki. President Truman's justification for the use of the the bomb was the claim that it forced the Japanese to surrender thereby saving an estimated 5,00,000 American combat deaths. This claim has been challenged by respectable American experts including Admiral William D Leahy who chaired the joint chiefs of staff during second world war. According to him: 'The Japanese were almost defeated and ready to surrender... being the first to use it, we adopted an ethical standard common to barbarians of the Dark Ages." The real reason for the first use of the nuclear brand of terrorism was the US geopolitical paranoid concerns about Stalinist Russia's advance and influence in the Asian Pacific region.

The potentiality of the use of chemical and biological weapons by terrorists poses another threat in future. They are easier to develop and use. The uses can aim at various targets such as poisoning of a water system, destruction of crops or generation of gases in enclosed spaces. As in the case of nuclear bomb, the US is one of the leaders in the use of chemical weapons during the Vietnam war. According to a recent report by Vietnam's labour ministry, defoliants and other chemical weapons used during the war turned about two million people invalid. As in the case of the use of nuclear bomb, the use of anti crop defoliants was justified by a military tactical logic. The purpose, it was argued by the science advisor of president Johnson, was to force population out of the communist controlled areas to areas under the Saigon regime (*Chemical and Biological Warfare* edited by Steven Rose, 1969, p 153).

Various forms of terrorism, along with other acts of violence, are likely to plague state formation inter-state, ethnic and gang-related conflicts in the future. Terrorism alone as a political tactic is unlikely to succeed unless it provokes establishment officials into extreme repressive measures, which may, under certain conditions, lead to the establishment's loss of popular support and the erosion of its legitimacy. The equation of the political effects of terroristic acts involves three factors—the influence of the propaganda by the acts, the response of the political targets of the acts, and the impact of these two factors on the public attitude and the state organisational set-up. It is difficult to measure adequately the balance among different dimensions of all these factors and additional exogenous factors such as covert and overt intervention by external forces.

The Billion Plus Population

Another Dimension

K C Seal
P P Talwar

While there are many estimates on the size of India's population in the year 2000 AD most people agree that a successful family planning programme will play a crucial role in bringing down the fertility rate

IN view of the crucial importance of the rate of population growth in the overall programme of economic and social development it has become essential to accelerate the pace of decline of the population growth rate this decline has to come from rapid decline in fertility Therefore a great deal of debate has been generated as to the strategies which can help in achieving this goal In a publication *The Inevitable Billion Plus* Vasant Gowariker has predicted that the population size of India will be substantially lower than any projection/prediction made so far by even the most optimistic demographers [1] He has used his own extrapolation of data to predict that With the birth rate down to around 21 per thousand, the death rate of 8 per thousand per year and the natural increase of 13 per thousand India will reach the threshold of the Net Reproduction Rate (NRR) = 1 0 within a decade from now [1] He is aware of the fact that this extrapolation may not be acceptable to most of the others but he deliberately wants to draw attention towards his assumed realism with a view to "deepen the debate on this important issue He has implied that one cannot be complacent on this possibility rather there is need to be serious about the population problem and has suggested that the government should set up three national missions to give necessary urgency and priority towards tackling the population problem Like past efforts which led us closer to our goals, such missions will give the necessary impetus for handling population-related issues on a war footing and bringing about population stabilisation within a short period

An attempt has been made here to examine critically some of the conclusions drawn by Gowariker keeping in view the various constraints regarding their feasibility in the present scenario of demographic transition The study focuses attention on (a) plausible levels of the vital rates in the future, (b) realistic time horizon for attaining the replacement level fertility (NRR = 1 0) and (c) likely population size by 2000 AD Some comments are also offered on the validity of Gowariker's assessment that India s population will never exceed China s population

CONTROVERSIAL PREDICTIONS

Gowariker s predictions seem to be based on a trend analysis of a few demographic parameters estimated from the past data as well as on the fact that a very major thrust is being given to the population control programme both by the central and the state governments In this paper the following conclusions drawn by Gowariker have been carefully examined

(1) The natural growth rate in 2001 AD will be 1 3 per cent This growth rate alongwith the observed growth rate of 2 14 per cent during the decade 1981 91 will give an exponential growth rate for the period 1991 2001 as 1 42 per cent i e, a very steep decline from the present level of 2 14 per cent during 1981 91

(2) India s population will not reach a billion mark in this century but may do so one or two years later

(3) India will reach the threshold of the Net Reproduction Rate of unity within a decade from now around which time the benchmark figure will appear and India s population will begin to move towards stabilisation at the billion plus level

(4) There is no possibility of India s population exceeding China s and threfore the prophecy of India becoming the most populous nation in the world in the future should be rejected

Exponential growth rate for 1991 2001

The natural growth rate for the period 1991 is the difference between birth rate and death rate for the year This comes to 29 5 9 8 = 1 97 per cent based on Sample Registration System data [2] Gowariker predicts the birth and death rate levels in 2001 as 21 0 and 8 0 and therefore, according to him, the natural growth rate of population in 2001 will be 1 3 per cent From these two figures (natural growth rate of 2 14 per cent in 1981-91 and 1 30 per cent in 1991), he computes the annual exponential growth rate for the period 1991-2001 as 1 42 per cent It is not possible to get this rate of growth unless the growth rate falls very steeply in the initial years 1991-93 itself, this is quite improbable Therefore, we do not accept this optimistic prediction of Gowariker

As a matter of fact, his prediction of birth rate of 21 and death rate of 8 by 2001 is in itself too optimistic and very doubtful An attempt has been made to predict a more realistic national levels of birth and death rates in 2001 by us A simple extrapolation of the pattern of yearwise decline in the level of three-year moving average of crude death rates for some of the states from certain past periods when it declined to about 9 8 (current level of national death rate) gives the level 8 1 in 2000 and 7 9 in 2001 [2] (Annexure 1) (The use of three-year moving average was made to smoothen the changing levels for the random fluctuations observed in annual figures) This figure is fairly close to the figure given by Gowariker

It may be stated however that this method of extrapolation assumes that the whole country will follow the pattern of decline in the vital rates similar to the states which have shown relatively higher declines in the vital rates than demographically less-advanced states Thus this method is expected to give an optimistic level of vital rates, the real value is likely to be higher than these optimistic levels unless the family planning programme shows much better results in the demographically backward states like Bihar, MP, Rajasthan and UP than in the past This approach which gives an optimistic level of vital rates seems to be reasonable in the context of various 'action possibilities' enunciated in Gowariker s paper

Gowariker has also predicted that the level of crude death rate may stabilise at the level of 8 This prediction does not seem to be reasonable when one considers the international experience of decline in death rate up to the level of about 6 and then going up to about 10 to stabilise Similar situation is noticed in Kerala where the CDR level has already declined to about 6 plus Possibility of such declines for the country like India is important in the context of the goal of NRR = 1—lower the level of death rate, lower has to be the level of fertility in order to achieve NRR of unity For instance, earlier projections of NRR = 1 had projected crude birth rate of 21 and crude death rate of 9 (National Health Policy [3]) but if the crude death rate declines to 7 9 in 2001, then the crude birth rate has also to be lower than 21 for NRR to be unity and the process of stabilisation to start

Regarding crude birth rate (CBR), a conservative estimate has been given (by Gowariker) to be 21 by 2001 Though this is the goal set by National Health Policy and all of us sincerely wish to be able to achieve it, the extrapolation of the recent trend in the levels of birth rate even in the "demographically advanced" states does not bring us anywhere near that desirable situation The fact of the matter is that extrapolation of the trend of birth rates from three-year moving average for some of the states which had reached the level of around 29 5 (that of India) in the recent past suggests that the average decline in future will be of the order of 0 56 units per year This will mean that the predicted level of crude birth rate in 2001 will be around 23 9 (Annexure 2) instead of 21 projected by Gowariker It is worth emphasising that the aforesaid level of birth rate has been arrived at under some optimistic assumptions which may not materialise in the near future

The recent data on Effective Couple Protection Rate has not shown optimism and therefore some demographers may argue against this level Nevertheless the type of efforts being made under the World Bank funded project like Child Survival and Safe Motherhood (CSSM) and the USAID funded project like Innovations in Family Planning Services (IFPS) suggests that the programme will pick up in the demographically backward states and 0 56 units of decline every year for the country as a whole might be feasible Thus our predicted birth rate in 2001 is 23 9

The natural rate of population growth on the basis of our alternative method from our prediction thus comes to 1 6 (23 9 7 9) in the year 2001 Based on the levels of growth rate in 1991 (1 97 per cent) and 2001 (1 6 per cent) we feel a more plausible exponential growth rate for the period 1991 2001 as 1 77 per cent per year This is far higher than 1 42 per cent predicted by Gowariker

India s population will not reach a billion mark this century

With the average annual exponential growth rate of 1 77 per cent per year for the period 1991-2001 and the population size of 846 3 million in 1991, the population size in 2000 and 2001 are predicted to be as shown below

2000	992 4
2001	1010 2

We therefore agree with the prediction of Gowariker that the population will not reach 1 billion by the end of the century However, it should be noted that these figures have been computed on the basis of 846 3 million population in the Census of 1991, this count has not been corrected for the under-count of the census which generally occurs

An independent check on the upper limit on India s population in 2000 AD could be obtained by using the figures of population projections given by the Standing Committee on Population Projections (1989) for the four demographically backward states of the country (Bihar, MP Rajasthan and UP) The percentage these four states together made in the Census of 1971, 1981 and 1991 of the whole country are 38 7, 39 0 and 39 7 respectively Their projected population size in 2001 divided by 0 397 will give an upper limit of India's population in 2001 (as it is expected that their percentage, i e 39 7 will further go up in 2001) The projected population size of these four states in 2001, corrected for the actual census count in 1991/projected count of 1991 gives the expected projection size of the aforesaid four states Dividing this count by 0 397 is expected to give an upper limit of the population size of India in 2000 and 2001 as given below

2000	995 1
2001	1015 8

This alternative approach also shows that India s population is not expected to reach 1 billion in 2000

India will reach threshold level of NRR=1 within a decade

The NRR of unity in our country will normally mean the total fertility rate of about 2 1 Therefore in order to predict the time period when India will achieve the total fertility rate level of 2 1, we have projected the pattern of decline in the total fertility rate (TFR) for some of the states which had achieved TFR of about 3 9 (the level of TFR for India for the period 1988-90) This method is similar to the one already discussed in Section 3 1 This method takes into consideration the fact that the pattern of decline in TFR differs from one level of TFR to the other but for reasons cited earlier this method is expected to give an optimistic time frame which is acceptable in the context of this paper

The states which had achieved TFR of about 3 9 or lower in 1981 83 were Andhra Pradesh (3 9) Karnataka (3 6) Kerala (2 8) Punjab (4 0), Maharashtra (3 7) Tamil Nadu (3 3) and West Bengal (4 1) The pattern of decline in TFR from this level to their level in 1988-90 has been determined (Annexure 3) it was found that the TFR changed by about 0 09 units every year [4] With this pattern applied for India, an optimistic time frame of TFR for India in different years is as follows

2000	TFR 3 0
2010	TFR 2 1

It therefore seems that prediction of Gowariker when he says that 'India will reach the threshold of Net Reproduction Rate of 1 within a decade from now (around 2003)' is too optimistic and is not expected to materialise For the country as a whole NRR=1 cannot be expected to be achieved at least till 2010

An independent check in this regard is available from K S Natrajan—he has fitted regression equations to the last 10 to 20 years trend data on TFR based on TFR for different states The long-term trend revealed by these regression equations have been utilised by him to compute the periods when different states of India will attain NRR=1 According to his calculations the states and the time periods when they will attain NRR=1 are shown in Table 1 Achievement of the replacement level of fertility by around 2003 as predicted by Gowariker for the country as a whole is therefore unrealistic and highly improbable

Stabilisation level of India s population

Another point has been made by Gowariker when he says that around 2003 India's population will begin to move towards stabilisation at the billion plus level In this regard it may be stated that though the process of stabilisation of India s population might start soon after 2010 the population will keep on growing till the next 60 to 70 years, a zero population growth will be reached only thereafter A computation of the increase in population after attainment of NRR=1 suggests that population may increase by about 20-30 per cent from the point it achieves NRR=1 to the point it achieves stable population with the rate of population growth of zero [5]

TABLE 1

States	Time Period When NRR=1
Gujarat Kerala Tamil Nadu and Punjab	Before 2001
Andhra Pradesh Assam Haryana and West Bengal	2001 2006
Maharashtra	2011 2016
Orissa and Karnataka	2016 2021
Rajasthan UP Bihar and MP	After 2021

TABLE 2

		Year 2001
Crude birth rate	=	23 9
Crude death rate	=	7 9
Rate of natural increase	=	1 60
Population size	=	1010 2

TABLE 3

Time Period	Population (Million) of India	China
2001	1017	1290
2025	1365	1569
Hypothetical size of stationary population (million)	1886	1890

Thus in our view, a more realistic (and somewhat less optimistic) prediction of different demographic parameters and the population size of India in 2001 are as in Table 2. For the country as a whole NRR=1 cannot be attained before the year 2010. Whatever might be the year, the population of the country will stabilise only after 60-70 years at about 20-30 per cent higher level than the level in 2010 or a later year when NRR=1 is attained. Under the optimistic assumption that NRR=1 will be attained in 2010, we have also computed India's population in 2010 and ultimately at the time of stabilisation. The projection of crude birth rate and crude death rate for the states from the time they achieve the CBR level of 23.9 and CDR level 7.9 (based on the method enunciated in Section 3.1) suggests that the crude birth rate and crude death rate in India in the year 2010 will be

		Year 2010
Crude birth rate	=	18.1
Crude death rate	=	7.3
Rate of natural increase	=	1.08

Thus according to our calculations the exponential rate of population growth for India per annum for the period 2001-2010 would be 1.31 per cent. This gives a population size in 2010 as 1,136.6 million. Since the level of population when it stabilises will be about 30 per cent higher than this level, India's population cannot be expected to stabilise at a level lower than 1,477.6 million in around 2080. It may also be noted that this size is much less than the projection of the World Bank [6].

Will India's population exceed China's?

For comparing India's population with that of China, it is necessary to adopt a similar set of assumptions on the vital rates and the same methodology. This has been attempted by the World Bank [6]. Their projections are set out in Table 3. It is noteworthy that despite considerable progress made by China towards achieving a zero rate of population growth, the population of China in 2025, as projected by the World Bank, is 1,569 million; this is substantially higher than 1,477.6 million which has been arrived at in the previous section as the stationary population of India around 2080 after attainment of NRR=1 in 2010. Thus with fairly quick success in controlling population growth, India's population is expected to be lower than that of China in the future. On the other hand, following the World Bank's model, India's stationary population after attaining zero population growth could be quite close to that of China; still it is less than that of China (though by a number of only 4 million). In this respect Gowariker's prediction may prove to be correct.

Concluding Remarks

Efforts have been made in the sections above to examine the demographic parameters for India till the country attains Net Reproduction Rate of Unity. Our alternative predictions are based on the extrapolations of trends in birth and death rates when they reach different levels. These trends reflect an optimistic scenario of India's population but it may not be difficult to achieve if our efforts towards family planning programme are genuine and serious. We feel that our estimates have greater reality because one expects difference in the pace of decline from one level of vital rate to the other. Nonetheless they are still extrapolations and the underlying assumption is that the programme will continue with policies and strategies which are more or less similar to the past and the experience of better-performing states will find more and more application in the programme of poor-performing states. It is therefore necessary that sincerity of efforts shown by better-performing states may be brought up into the programmes of the poor-performing states particularly in the states of Bihar, MP, Rajasthan and UP which form about 40 per cent of the country's population.

Gowariker, on the other hand, "visualised a pronounced downward gradient of the

Annexure 3

Time Period and Patterns of Change in Fertility in the States where Total Fertility Rate is around 3.9

Time Period	Level of TFR for States						
	Andhra Pradesh	Karnataka	Kerala	Maharashtra	Punjab	Tamil Nadu	West Bengal
1981-83	3.9	3.6	2.8	3.7	4.0	3.3	4.1
1988-90	3.1	3.3	2.0	3.4	3.3	2.4	3.4
Average decline	.11	04	.11	.04	.10	.13	.13
	Average decline = .09 units per year						

1981 variety to occur in the current decade". In this sense, his prediction should have been similar to ours since we have also assumed the continuance of the past trends, at least of better-performing states. But, what we interpret as the reason for greater optimism of Gowariker is the idea 'that an average rural and urban folk of this country, through his common sense and wisdom, will take a practical view of what he hears about the desirability of a small family". Such internal urge can definitely accelerate the pace of acceptance of small family and prediction of Gowariker may come true but unfortunately majority of India has not yet realised such socio-economic milieu and we feel that it will take still several more years for that environment to come.

Therefore, in our view, the country has not come to achieve the environment which Gowariker has visualised and which has led him to give a picture of great optimism. We feel that we still have to depend for a major part of our reduction in population growth rate on effective and efficient family planning programme which not only should create demand for the services but also meet demand through provision of good quality services. Though the programme has started to bring about such a culture but it is a time consuming process, we have to give much more impetus to accelerate its pace.

Gowariker's book *The Inevitable Billion Plus* besides three articles of Gowariker contains a large number of other interesting articles written by specialists dealing with specific aspects of India's population problem. Although the reasons for the undue optimism of Gowariker are not very clearly indicated in his article it seems that he has laid considerable emphasis on our success in networking various action possibilities highlighted in others' articles so as to overcome the current apathy towards universal acceptance of a small family norm in a large number of states (particularly the four Hindi speaking states) and certain segments of population. Gowariker's suggestions are undoubtedly good and worth pursuing by the government but to expect quick results out of them, will in our view be too optimistic. Past experience suggests that many useful 'action possibilities' have failed to yield the desired results because of the social economic cultural political and bureaucratic milieu in the country. Therefore our alternative methodology provides a more plausible scenario, which though somewhat optimistic yet may not be very difficult to achieve.

Our analysis on the four issues discussed in Gowariker's two papers referred to earlier tends to suggest the following:

(a) India's population in 2000 AD might be slightly less than a billion but it would cross the billion mark in the next decennial census.

(b) Replacement level of fertility (NRR=1) will not be reached for the country as a whole at least till 2010 AD.

(c) Even if NRR=1 is achieved in 2010 the stationary population of India will be substantially higher than one billion namely, about 1,478 million and the stationary population can be expected to be reached only around 2080 AD.

(d) India's population may not exceed that of China for many years to come despite China's far better performance than India's towards population control programme in the last two or three decades. Nevertheless the gap in the population size of the two countries is likely to be reduced substantially unless family planning programme in India shows sharp improvement in its performance especially in the four Hindi-speaking states which have remained demographically backward during the last four decades.

Three national missions on (a) full literacy (b) adequate energy and (c) innovative communication to popularise small family norm advocated by Gowariker are no doubt worth pursuing. In our view creation of a mammoth cadre of innovative communicators to convey family planning message to all married couples in an effective manner would be a stupendous task. The adoption of small family norm especially by the poor couples would certainly depend on their conviction that their essential needs (both current and future) could be met with a small family such as only a son or a daughter who can provide them with adequate social security at their old age. This may be found extremely difficult unless innovative social security schemes are also launched in our country to cover the poor and neo-literate couples to provide them adequate old age security. Of course harsh measures as adopted in China in the past for forcing couples to accept one child norm might yield quicker result but adoption of similar disincentives for non acceptance of family planning programme may not be feasible in a democratic country like India.

Kirloskar Cummins Limited

Regd. Office : Kothrud, Pune 411 029

Excerpts from the speech delivered by Mr. J. T. Dewing, Chairman, at the 33rd Annual General Meeting on August 10, 1994

As all are aware, our Chairman Emeritus, Mr S L Kirloskar, passed away on April 24, 1994 at the age of 91 years He was a man of vision and foresight - recognized here, and by others who had the privilege of meeting him, as one of the best businessmen He founded KCL in 1962 His guidance helped enable your Company to be the leading independent diesel engine manufacturer in India

Leadership

Last year, we gave a briefing of the Cummins joint venture tie up with Telco to produce engines for powering Telco vehicles I have been asked to assume responsibilities for overseeing all Cummins business activity in India Mike Dodsworth has agreed to take on the job of Managing Director of KCL effective August 1, 1994 I will continue as Non-executive Chairman and may have the privilege of addressing you for yet a few more years I want to take this moment to express to all my sincere thanks for supporting me in discharging my responsibilities

I would like to mention in particular the guidance given to me with generosity and goodwill for KCL and CDS&S by my predecessor, Arun Kirloskar

In this regard, I would also like to recognize two Directors who have helped shoulder the leadership responsibility during my tenure Sudhakar Nagpurkar, President of KCL and Mohan Tol, Managing Director of CDS&S For over 30 years, Nagpurkar and Tol have served your Company with unswerving loyalty, fierce dedication, intelligence that keeps learning and increasing wisdom

Company's Performance

Indeed, last year is best understood as the sum of two distinctly different halves -

- The first six months as the end of a recessionary phase
- The second six months as the start of a dramatic recovery with 40% growth in KCL's domestic sales

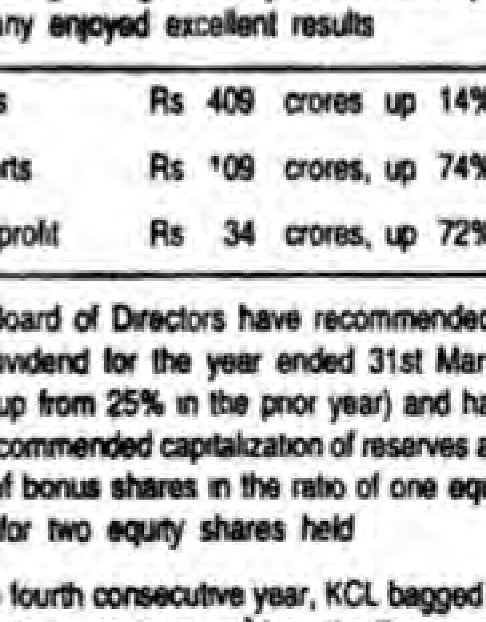
Export markets for your Company's products were strong throughout the year, therefore, your Company enjoyed excellent results

Sales	Rs 409 crores	up 14%
Exports	Rs 109 crores,	up 74%
Net profit	Rs 34 crores,	up 72%

Your Board of Directors have recommended a 30% dividend for the year ended 31st March, 1994 (up from 25% in the prior year) and have also recommended capitalization of reserves and issue of bonus shares in the ratio of one equity share for two equity shares held

For the fourth consecutive year, KCL bagged an all India top exporter award from the Engineering Export Promotion Council

Your Company has a tradition of being number one The past year was no exception, **KCL was awarded the Gold Trophy 'BEST AMONG WINNERS' in the first Rajiv Gandhi National Quality Award Competition.**



Rajiv Gandhi National Quality Best Among Winners Award

This meant that not only was KCL adjudged best of engineering companies but also, best among the winners from other industry segments

I can further announce that last week your Company successfully passed a 3 year mandatory ISO 9001 re-certification audit of its quality management systems by BVQI (Bureau Veritas Quality International)

Commitment to Excellence

In December, 1993, your Company conducted an exhibition of improvement work by the entire management team called CPS convention CPS stands for Cummins Production System, a framework of concepts and practices by which your Company is strengthening its lead in India and increasing its exports

70 % of management volunteered to participate in 165 different project teams This is a positive indicator of the extent of involvement in continuous improvement efforts

"To give more insight into the methods we are using, I want to share with you a few highlights of the 10 CPS practices"

Highlights of the 10 CPS practices

1. Put the customer first

We want to understand our customers' business needs so well that we can keep them as "customers for life" We strive to provide each customer a "value bundle" of product, information and services that creates a measurable comparative advantage This work involves each employee of the Company

2. Involve People

Your employees are the Company's greatest strength Customer delight can be created only by employees who are competent, enthusiastic and involved in improvement work We have increased the percentage of hours dedicated for training and development for each employee Our target is to reach 100 hours per employee per year We are committed to the practice of connecting people in cross-functional teams and supporting their efforts to improve the flow of work through the Company. Our people know each of their internal customers and work to improve performance to them.

3. Synchronize flows and shorten lead times

Once work is seen as a series of flows, improvement comes from the premise that work is "pulled through the plant" at a pace that will meet customer needs on time. The synchronizing or "timed co-ordination" of many different streams

All projects were judged and the top projects were recognized with the winning team going to Columbus, Indiana, U S A. to represent KCL in the Cummins International CPS Convention.

Business outlook

During the first four months of this year, your Company has shipped nearly 2500 engines and sales turnover is in the range of Rs 150 crores This is 25 % better than the previous year and reflects growth of 40 % in domestic engine sales Our export business remains strong and we are actively engaged in developing new projects with Cummins in the higher horsepower range

The most concerning economic variable is inflation caused in large part by supply constraints versus the powerful flow of funds in the economy Controlling inflation must remain of utmost concern for the country as its effects are always cruel and disproportionately assessed Whatever the stated rate of inflation the "misery index", which is the inflation rate of basic essentials, is much higher

Your Company is in the energy business The gap between energy demand and generation is estimated at approximately 10,000 MW in 1996 and growing This means higher generating set business Ambitious plans for increasing production of coal and other minerals, and boosting productivity in terms of output per manshift mean higher requirements of engines both in numbers and horsepower ratings Other sectors and applications, industrial, locomotive and marine also offer excellent prospects

One aside - I would like to note the trend to higher horsepower requirements in borewell applications in order to drill yet deeper wells to reach receding water tables How long can the water table continue to drop? What is the country's policy and action programme?

All this growth in demand means doubling the production of engines within the next 3 years Your Company is geared up to achieve this target by working as per the Cummins Production System We are confident that we can compete with the best

Our collaborator, Cummins Engine Company, the world's largest producer of diesel engines above 200 horsepower is celebrating a 75th anniversary during the current year Cummins considers this as an opportunity to thank all the customers suppliers distributors, communities, shareholders and employees for their part in helping Cummins succeed The on-going, open and mutually collaborative relation of your Company as part of Cummins world-wide family is a key competitive strength In this regard, your Company s competence in alternative fuels is opening another avenue of promising collaboration with Cummins in advanced engine development Cummins leadership in materials technology and fuel efficient, low emission electronically controlled engines continues to provide KCL with a stream of product advantages

Appreciation

Let me conclude by thanking the Financial Institutions, Company's Bankers Depositors and Shareholders for the trust which they have reposed in the Company I also thank the central and state governments and the local bodies for their help in achieving our targets I would also like to place on record our appreciation of the cooperation received by the Company from our various collaborators and suppliers I want to thank all employees for their hard work, inspiration and excellent team spirit which has enabled your Company to achieve excellent results Last, and most emphatically I thank our customers for their on going confidence expressed in each decision to buy

Note This does not purport to be a record of the proceedings of the Annual General Meeting

of work is essential Much careful analysis and creative work is needed to simplify processes eliminate bottlenecks reduce wasted motion reduce non-value added activity and shorten cycle times This work must be done at the most detailed part by part step by step level

4. Build in quality at source

We strive to make a perfect part every time This means each operator must achieve quality control and not rely upon inspectors Much work must be done to anticipate and eliminate sources of error what we call "failsafing" The first question to ask is "what is wrong not who is wrong" The documented quality system is essential and must be followed precisely and in detail

5. Ensure equipment is capable

Perfect parts cannot be made each time without the right tools in the right condition This begins when the part is being designed by selecting a best match with production process We use statistical methods to determine that processes are able to produce parts within the allowable tolerances Care and maintenance of equipment and tooling is essential to maintain these capabilities

6. Create functional excellence

Excellent overall results for customers depend on each person's knowing his or her job This cannot be left to chance All work is to be defined and, so too, the specific skills and knowledge which are crucial With carefully defined "position profiles" managers can establish training needs. Formal training for each skill and knowledge module is developed to meet these needs. Detailed check lists are also designed for each function to assess its total system approach and identify priorities for improvement

7. Establish right environment

People perform better when work conditions are right This means keep things simple and visible so that variations "scream for attention" A clean, orderly tidy healthy and safe environment is essential for quality results We have given this practice special emphasis for improvement in the current year and this will continue

8. Treat suppliers as partners

The plant outside KCL is equally important to customer satisfaction as is the KCL plant We work to develop longterm relationships with our suppliers and commit our people to work with them to install quality systems that provide defect-free parts, fit for use on the required day We view them as partners in our business and try to do joint analysis of ways to eliminate waste and reduce cost

9. Use common approach

We have training underway to teach people a common approach for solving problems and improving processes This not only sharpens each employee's skills but also allows efficient teamwork since the terms and methods have consistent definitions We use a cascaded training technique starting with leaders We recognize that true mastery comes only when one has prepared and taught a subject to others We extend this training to suppliers and dealers

10. Achieve continuous improvement

Through all the above, we are only and always in the process of getting better Of course, the rate of improvement must be faster than the competition's. We teach that making small improvements is a superior method to waiting for "delayed perfection"

Explanation in Social Sciences

Mohammad Talib

Explanation and Understanding in Human Sciences by Gurpreet Mahajan; Oxford University Press, Bombay; pp xii + 124; Rs 150.

SELF-CONSCIOUS perspectives in social sciences, informed of their philosophical underpinnings, continue to be intrigued by question such as 'what constitutes an explanation?'. It may even be a query desperate to qualify the claim to veracity: 'What is a good explanation?' Simple answers elude the question inasmuch as 'good' satisfies different standards of authentication. Thereby, 'good' remains a common adjunct to different explanations at the same time. Surely, the cognitive interest of researchers and their varying definitions of objects of knowledge are critical factors in analysing the construction of explanation in social sciences.

Explanations are also construed in terms of the chosen ontological features of the being under examination (discursive vs practical, meaning orientation vs extra-meaning conditions, particularising vs generalising features of the objects of knowledge). The book under review offers an account of a range of explanations in human sciences. Each mode of explaining the phenomenon seeks to do justice to the specific nature and complexity of their objects of study. Perforce, the relative appropriateness of an explanation draws upon the judgments pronounced by social scientists about the nature of the thing to be explained.

The title of the book provides only a partial glimpse of the problematic of the study. Indeed, the detailed exegesis of the study pertains to the various claims to knowledge of the social world. The terms 'explanation' (commonly the causal mode) and 'understanding' (usually the hermeneutic tradition) appearing in the title, are merely two conceptual motifs of the argument under examination. As a matter of fact, the study presents reason-action explanation, hermeneutic understanding and the narrative as three alternatives to the causal mode of inqufry that has, in some form or the other, dominated the social sciences for several decades. Not that there was a unanimous agreement on its precepts; simply that the causal mode served to set the context of debate about the nature of social sciences (with reference to its methodology and the object/subject of investigation). The present study 'specifies the distinctiveness of each mode of inquiry...it analyses the implications of using a particular vocabulary and language. More significantly, it examines whether the language of text and understanding, and whether the new language and the world-view expressed in it can be accommodated with other non-causal forms of explanation' (pp ix-x).

Causal Mode of Explanation

This form of explanation assumes that the observed event is a consequence of some other antecedent event or condition, that the cause and effect are linked contingently through a law. The existence of such a law or "exceptionless generalisation is regarded as a pre-condition for the existence and affirmation of a necessary connection between two variables" (p 4). Indeed, it is on the basis of such laws that the given phenomenon is explained through the identified cause. Consequently, the search for laws is considered to be an indispensable part of causal investigation. "Two kinds of arguments are adduced in support of this claim: First, causal assertions are implicit in and may be deduced from such laws; second, every causal assertion refers, at least implicitly, to one such general law and the stipulated causal connection is defensible only if the corresponding general law is defensible" (p 5).

The notion that every causal explanation must refer at least to one general law and without such a law no explanation is possible has been challenged on two grounds. "It is argued that social scientists, particularly historians, are concerned with the study of particular occurrences: they examine what happened in *this* particular instance and not what happens every time such events occur...Secondly, and more importantly, 'dredging up' the relevant law is *not* always necessary for explaining a given occurrence...(in other words), the linking together of two variables or objects points to the existence of a law but an explicit reference to that law is not necessary for furnishing an adequate explanation" (p 9). In a sense, the concept of cause gets redefined by "the claim that the social scientists provide explanations of particular events rather than of types of events" (p 14).

Given this framework, the cause refers to "a condition that was contingently necessary or necessary under the circumstances...The cause is here conceived of as an INUS condition, i e, a condition that is an insufficient but necessary moment of a complex that is unnecessary but sufficient for producing the given effect (p 17)...The notion of cause as an INUS condition takes into account the possibility of there being more than one complex of minimal sufficient conditions, and hence, it suggests that (a given condition) could be regarded as the cause (a necessary moment) only if it is a part of complex of minimal sufficient conditions that was present at that time (p 18)...INUS condition is specified in the context of a particular inquiry, i e, it has an identified causal field...(It) also approximates the social scientist's/historian's use of the term 'cause'. However, it is difficult to apply this notion of cause to situations...where two or more minimal sufficient conditions containing different elements are present simultaneously (making it difficult to) specify an INUS condition" (p 19).

One learns "that the notion of cause that is most appropriate for the social sciences is one that undermines the very ground on which causal explanations are frequently privileged and justified. By dissociating explanation from prediction and relinquishing the search for general laws, it renders these explanations incapable of serving technical interest" (p 25). Therefore, one is persuaded "to look beyond causal explanations and explore other ways of explaining an occurrence" (p 25).

Reason-Action Explanation

It has been argued that the subject matter in social sciences do not have an objective existence independent of the investigator. Rather, the social scientists deal with objects that are produced by human beings and their social world, which in turn, have a bearing on the actions of people themselves. It has been suggested that the significant historical events, for example, revolts, campaigns, etc, can only be explained as 'doings', performances of groups and individuals. This requires a reference to the actions of the agents which in turn are grounded in the intentions, motives and beliefs of the individual.

This mode of explanation wherein an agent's action is understood in terms of his avowed reasons is shown to present at least *four* problems: "First, agents do not always give reasons for their actions, so it is not always possible to refer to avowed reasons. Second, even when they do give reasons there is no way of determining that the avowed reason is the 'real' reason for performing that action. Third, most often historical agents give reasons retrospectively to justify their action and to make it appear reasonable. Fourth, while explaining the same action, historical agents sometimes offer different reasons to different audiences" (pp 31-32). Consequently, it is suggested that a choice is to be made between different avowals, for no a priori criterion exists for

privileging one assertion over another. In view of these difficulties, historians frequently hold the avowed reasons in a temporary abeyance and seek to locate the reason for an action through an analysis of the existing situation and the expressed intentions of the agent

Critics argue that the reason-action explanation "brackets the historicality of agents and assumes that human nature is the same and that there are certain known and given patterns of intention-action interrelationship" (p 42) It is further argued that 'what happened in history cannot be reduced to the intentions of agents and events cannot be understood merely as the products of human action" (p 43) Therefore, it is pointed out that reason-action explanations serve a limited purpose, while they can help us to explain the actions of the agent, they are unable to explain the occurrence of the historical event' (p 43)

Hermeneutic Understanding

The next form of inquiry that follows rational-action explanation is hermeneutic understanding (This) is primarily a way of recovering the meaning of the utterances and performances of the historical agents However what distinguishes it from other modes of inquiry is the historical nature of its perception namely its claim about the historicality of human existence and the plurality of historical worlds' (p 50) Such an exercise creates fewer tribulations as long as the object of knowledge and the researcher share a common society and history But the act of understanding becomes complex and difficult when the researcher addresses the linguistic expression and practices of people who belong to a historical time and culture quite different from our own (p 53)

The purpose of an hermeneutic inquiry is stated to be two fold (a) it seeks to understand the other and (b) by making available the life of the other it opens up new worlds and possibilities to us (p 64) This phenomenological excursion in the world of other reveals to us the finitude of our existence and offers us another world on the basis of which we can question our beliefs and certainties (p 67) This form of explanation too is severely limited in its grasp of human action One significant limitation is that it neither reflects upon the condition of effective history that 'ink certain perception with determinate structures of material reality nor does it consider the possibility of comparing and relating aspects of the cultural religious and economic system" (p 70) Furthermore this mode of understanding is shown to suffer from an implicit contradiction "On the one hand, it questions the universalism and scientific rationality of the enlightenment mind On the other it postulates a high degree of consensus and homogeneity within a society It recognises the plurality and incommensurability of world-views over spatial and temporal boundaries, but it does not seriously consider the existence of different world-views and language games within a given society" (p 71) "The hermeneutic method remains restricted to the world of shared meanings and practices and ignores in the process, the contestation of values and meanings within a society" (p 71)

The narrative mode is presented as "a form of explanation in which the explanandum (the event to be explained) follows from and appears as a consequence of the actions of individuals and groups placed in some determinate historical situation" (p 81) This mode of explanation claims 'to grasp the uniqueness and particularity of the object and explicate precise configuration of forces at that time" (p 76) A historian seeking to explain a historical event by depicting it in the narrative in terms of "a reconstruction of an occurrence or a situation that has not itself survived Thereby, the narrative assumes a representational picture and not an imitation or copy of the past" (p 88)

The concluding consideration on method aptly remind the reader that the presentation of different modes of inquiry in the study was no attempt 'to privilege any one method absolutely and unconditionally The discussion of particular modes of inquiry (becomes more meaningful) in the context of the specific conceptions of the nature of social science and judged in terms of what they seek to analyse and what they exclude from examination (p98) Amidst competing claims to knowledge the existence of various examinations is legitimised in terms of their ability to offer new insights and uncover different aspects of reality" (p 102) Pluralism in explanation is also justified in terms of an absence of a theoretical grid from which we can view the world in itself and write its history (p 102)

The exegesis of the various modes of explanation presented in the study carry at its back various unexplicated presuppositions These pertain to the nature of subject object relationship or the dialectics between the enquirer and the phenomenon under study An epistemological picture etched on the descriptions of various explanations The picture is that of an enquiring mind on the one side and an independent reality enquired into, on the other The enquirer remains an active principle, equipped with the instrument of knowledge and a creator of the definition of the object under study At the other polarity, the social reality to be explored is assumed to present itself as a passive resource for the required constructs of knowledge The reality to be explored appears to be discursively incapable of revealing what it is not but could possibly be [1] Furthermore, the exegesis does not clarify why a given explanation furnishes different slices of reality in accordance with the differing cognitive interests of the enquirer Change the cognitive interest in the pursuit of social science and the entire human preoccupation with knowledge change will acquire a qualitatively different mode Even the theoretical statements about facts and the discursive strategies employed would be predicated upon a different knowledge-constitutive interest (i) knowledge that expands our power of technical control, (ii) knowledge that make possible the orientation of action within common traditions and (iii) knowledge that frees consciousness from its dependence' on hypostatised powers [2]

As the analysis of various explanations treats the enquirer as an active principle, the phenomenon under study appears as a 'pebble by the seashore' It is grasped out of an accidental encounter, as a chance of fortuitous occurrence The enquirer is gathering knowledge to reinforce a customary expectation or a policy prescription But sure enough, the active voice of the enquirer is not constituted within the ambit of a dialectical movement of an agency or an organised praxis seeking (through the pursuit of explanation) a retrospective grasp of its self-development [3] There does not seem to be a way out of the given frame The exegesis in its content and scope, remain restricted to a philosophical-methodological locus characterised by explanatory pluralism The equal status granted to various explanations, are forever, condemned to stay in a state of humble submission before the world-in-itself (for the moment the terrain beyond cognition)

The particular aspect of the being chosen as its constitutive feature, also become the methodological axis around which the intuitive material pertaining to the object of knowledge in different situations, is regulated for the purpose of explanation The constitutive feature of the being transforms into a regulative category monitoring the scientists' gaze This is how an explanation allows itself to a priorise an object of knowledge in matters of further research Understandably the explanation gets altered into a theoretical slant a logical screen influencing the selection and organisation of perception

The various explanations presented in the study stop short at the object of knowledge without examining how the object graduates into a subject of research These explanations are limited to the task of ascertaining adequacy (with respect to the standards of authentication set by the community of social scientists) and not relevance of knowledge to people themselves whose status is otherwise restricted to provide data about themselves This asymmetry between the subject and the object in the conventional mode of explanation is an outcome of the social asymmetry between those who do

research and those upon whom a research venture is routinely carried out [4]

A step beyond the mode of explanation presented in the study necessitates that the asymmetry between the subject-object relation is overcome in the theory and practice of research. Reference may be made to an emerging tradition in the history of research methodology where the subject-object relation is represented dialogically and self-reflexively. This mode of explanation involves not merely representing the phenomenon adequately but a complex mutual engagement of the subject and the object. It transforms the object of knowledge into "a speaking subject, who sees as well as seen, who evades, argues, probes back" [5]

Thus the dialogical or participatory mode of explanation does not relate to a static picture of the phenomenon or a series of them from singular points in time. Instead, it refers to a dialogue over time dealing with the dynamics of reality. And also, "the objects of the theory actually become subjects to it which is to say they help to fashion it by their own choices and actions, and by their responses to it" [6] This mode of explanation involves both subject and object and no part of it intrinsically belong to either. Whatever stands on the side of the subject can be transferred to the side of the object, and vice versa. This view provides corrective to the idea that the subject/object are something absolute and ineliminable.

For such an explanation, the validity of claim to knowledge is partially located in terms of the responses that the social actors themselves have to the theory and partly in terms of whether the theory offers a way out of an untenable situation [7] That an explanation indeed offers a glimpse of the possible reality is not merely decided by a community of scientists but the community of people as well who recognise it so and who are able to organise their praxis in its catalytic medium.

The dialogical and participatory mode of explanation seeks sensitivity to the reality not-yet. It recognises that the realm refers to the phenomenon which has not yet given itself a reality of its own, a reality produced from its own collective resources of people's projections, imagination, dreams, ideological anticipations etc. The not-yet belongs to the domain of the possible distinguishable from the actual. A typical experience of an intuitive understanding lacks the orientation to know what lies outside the fold of immediate sense intuition. A possible reality slips out of hand inasmuch as it is unable to produce a certificate of viability issued by experience [8]

This explanation, an alternative to those described in the study, recognises that the very things which make knowledge possible—our ability to monitor our own monitorings, to learn and hence to change our interpretations, actions and responses [9]—are also processes which make the social science enterprise a complex of dialogism and mutual participation between the subject and the object. But this remains not just an external and contingent sociological condition of learning but its constitutive force, which not only drives it but shapes its form. The radical implication of this can be revealed by referring to the role of researchers in stimulating this potentially emancipatory change in others in the process of understanding them. The book under review addresses themes at the centre of current developments in philosophy and theory of research methodology in social sciences. It will be essential reading for all those concerned with the issues and debates in the area.

Notes

1 A pungent retort against such a state questions: "What science is this that only holds true when its subjects hold still? Strange laws that presuppose humanity in formaldehyde! What scientists are these who peer into everything below yet see nothing ahead?" quoted from Nicolaus Martin, 'The Professional Organisation of Sociology: A View from Below' in Robin Blackburn (ed) *Ideology in Social Science*, Fontana/Collins, 1979.

2 This classification is drawn from Jurgen Habermas, *Knowledge and Human Interests*, Polity Press, 1987, p 313.

3 A radical reconstruction of social can immensely benefit from the rich material produced on Hegel Critique of Kant. The present insight is derived from W H Walsh's contributions in Stephen Priest, *Hegel's Critique of Kant*, Clarendon Press, 1987.

4 For further details to a critique of conventional research see Walter Fernandes and Rajesh Tandon (eds), *Participatory Research and Evaluation: Experiments in Research as a Process of Liberation*, Indian Social Institute, 1981.

5 Quoted in Clifford James, 'Introduction: Partial Truths' in James Clifford and George E Marcus (eds) *Writing Culture*, Oxford University Press, 1986.

Managing Common Resources

Dolly Arora

Managing Common Pool Resources: Principals and Case Studies by Katar Singh; Oxford University Press, Delhi, 1994; pp xx+366, Rs 425.

WITH the rapidly-worsening state of world's natural resources and the growing realisation of the need and urgency of averting this, the attention of scholars/policy advocates the world over has been drawn towards understanding this degradation and destruction, and further, devising strategies for their sustainable management. Numerous exercises have been undertaken in both theoretical and empirical realm, especially with a focus on common property resources, which have undoubtedly been the worst afflicted by this tragedy. The explanations and remedies offered by various scholars as well as policy-makers in various settings, however, have been as diverse as the empirical evidence obtained regarding the state of commons themselves. The book under review provides a good introduction to existing theoretical frameworks for analysing common pool resource management problems on the one hand, and offers a detailed analysis of several specific cases in CPR management in India, on the other.

Written primarily for graduate and post-graduate students in common pool natural resource management and resource economics, it makes no claims to originality of ideas and approaches presented in it. The author, however, emphasises its unique approach, organisation, focus and mix of theory and practice, and asserts—quite rightly so—that no other comparable book on CPRs is available in the market. The book is divided into three parts. Part one deals with the basic concepts and connotations of CPRs, theoretical approaches, management regimes and instruments of CPR management. Part two provides a detailed discussion of a some nine cases in CPR management in India, and evaluates these in terms of the theoretical frameworks dealt with in part one of the book. Part three attempts to synthesise the analytical conclusions and lessons which flow from case studies and the literature reviewed in the book.

Differentiating common pool resources from common property resources on account of the irrelevance of any well-defined property rights in defining the latter, Singh has chosen to focus on the broader category of common pool resources, which may or may not be privately or commonly owned, and which are so defined because they are accessible to and jointly used by people living in a particular geographical location such as a village or a cluster of villages—global commons remain largely out of the scope of the study. Most of India's rural poor, he rightly underlines, depend considerably for their livelihood on CPRs. But with the growing commercial exploitation of CPRs that is now going on, the poor find it increasingly difficult to meet their basic requirements from CPRs (p 19).

Conservation, development, and utilisation of CPRs, argues the author, are highly influenced by national and international policies and politics. There are many instances where national export promotion policies and international transfer of technology have significantly boosted the rate of utilisation of natural resources, most often beyond the limits set by local conventions and traditions. While a major change in the utilisation-pattern of natural CPRs in India came with the British who linked these resources with the direct and large-scale non-local demands of western Europe, after independence also the colonial institutional framework for natural resource management did not change materially (p 22). Lack of appropriate environmental protection policies and ineffective enforcement of existing policies led to degradation of natural resources and environment. International aid and trade policies also affected the state of natural resources in general and CPRs in particular: these policies generally tend to promote free markets, privatisation, entrepreneurship, and export-led growth, all of which lead to over-exploitation of CPRs for commercial purposes. Most of the loans from international development banks like the World Bank and its regional counterparts, by requiring the recipient countries to pledge so-called counterpart funds to complement the foreign aid and investment, and by linking the repayment of loans to exports from the recipient country, sadly led to exhaustion and degradation of natural resources, including CPRs, at an accelerating rate (p 23).

With Oakerson, Singh defines the CPR problem as one of co-ordination: although common pool natural resources include such diverse things as community pastures, lakes, rivers, streams, groundwater basins, forests, fishing spots, etc, they all face one common problem of how to co-ordinate the actions of individual users to attain an optimal rate of production or consumption for the whole community (p 12). The need for co-ordination and management is presumed to emerge when the flow of products/services from the resource is insufficient to meet the demand of a community. The primary causes of demand for products/services of a CPR exceeding their supply are identified as: increase in human and animal populations, discovery of new uses for the CPR and/or its products, development and availability of new technologies for exploiting the CPR and for processing, transportation, and marketing its products, discovery of new markets, and launching new public policies and programmes. The possibility of a CPR problem, occurring when the demand is constant is linked to a decline or deterioration in the supply of the resource caused by such factors as degradation due to natural processes, destruction by natural and/or man-made calamities, lack of necessary maintenance, etc (p 12).

Five theoretical approaches to the diagnosis and analysis of CPRs problems—the static equilibrium model, Olson's theory of collective action, Buchanan's and Tullock's cost approach, the game theoretic approach and Oakerson model—have been discussed and evaluated. The objective is to understand the human behaviour which threatens CPRs. The CPR analyst, it is suggested, can benefit from the logical use of conclusion reached by all five models. The case studies presented in the book too have drawn insights from all these models, though Oakerson model has been given a more favourable treatment. For Oakerson model, feels Singh, can be easily adapted to fit any situation.

Three alternative systems for managing CPR problems—privatisation, nationalisation, and creation of some other institutions for collective management, such as CPR user's organisations, etc—have been examined. Though it is suggested in the beginning of the book itself that there are many factors inherent in the structure of the rural economy of most developing countries which make it desirable for these to hold as common property as much of their natural resources as possible, this section emphasises that since there is no one best system of CPR management for all situations and all times, the choice of the system will have to be situation-specific. Irrespective of the system chosen, however, the government is expected to facilitate creation of collective management systems by providing an enabling legal framework, technical information and assistance, and some financial help initially, if and where absolutely essential (p 70). Privatisation, nationalisation and collective management have been treated as institutional frameworks within which a wide range of policy instruments discussed in the book are supposed to become operative. These tools are grouped into four categories—public finance which includes public investment, taxation and subsidies; money and credit; direct controls, such as quantity quotas, seasonal restrictions safe minimum standards and price controls; and changes in institutional framework, implying the management regimes also. The compatibility of tools chosen with the conditions under which management is to apply is considered extremely important. So also is their effective enforcement, which, it is emphasised, has always been problematical (p 95).

The case studies presented in the book cover a wide range of subjects as well as contexts—the Gambhira Co-operative Farming Society, Gujarat; the privatisation

of common pool land in West Bengal, the Mitteman Watershed Project, Karnataka, the Mohini Water Co-operative Society, Gujarat, Common pool irrigation tanks, Andhra Pradesh and West Bengal, the Parwara Van Panchayat, Uttar Pradesh, the Aslali Village woodlots, Gujarat, the joint forest management experience of Arabari, West Bengal and the Bergram Majhipara Common Pool Fish Pond West Bengal. Some of these cases have been analysed and evaluated in terms of the Oakerson model, with its four components—the technical/physical attributes of the specific resource, the decision making arrangements organisations and rules that currently govern relationships among users the patterns of interaction among decision makers and outcomes and consequences which in turn imply evaluation in terms of equity and efficiency.

Since Oakerson does not consider the time factor in specifying efficiency and equity and since time is an important determinant of optimal allocation and use pattern of most natural resources Singh has defined both efficiency and equity in the long run presumably to take these closer to sustainability and intra and inter generational equity in distribution of benefits from CPRs. However this reviewer feels that since these criteria are applied only with reference to the context under study/project without referring to the implications of actions/inactions for the wider reality the evaluation is likely to be misleading in many cases. Successful conservation efforts leading to increased productivity or even equity in a given region may at times be at the cost of decline of these in other regions. In case of forest protection efforts in certain specific areas, for instance, it has been noticed that neighbouring regions often bore the brunt of their concern for increased productivity, for people in the protected area turned to these to meet their needs from forest. Islands of high achievement may also have negative implications for other surrounding or even distant areas. sustainability therefore must take into account the spatial linkages between success and failure too.

The book undoubtedly makes an interesting reading especially for those not yet initiated into the study of commons problems. It must however be read with care especially by the policy makers and managers or NGOs concerned with finding ways of saving the CPRs. The limits of professional management of complex and varied local contexts must not be under estimated. And suggestions about the replicability of what is considered by the author to be a successful and replicable experience must not be interpreted without qualifications. While almost every case analysis presented in the book emphasises that no generalisation can be made on the basis of a single case, an attempt is nevertheless made in each case study to differentiate the variables which could simply not be replicated in other situations from those which, the author felt, could be found in other contexts, and therefore could make way for similar results there too. In doing so, however, the inter-relationship/interdependence of these variables is not duly acknowledged. It is doubtful if some replicable variables can accomplish the results which emanated from a complex relationship of these to several others which cannot be replicated. The suggestions like attempting replication of the Mitteman Watershed Project have to be interpreted with sufficient care. For similar efforts elsewhere—in Haryana, for instance, after the much celebrated success of Sukhomajri Project—have thrown up serious challenges.

With its accent on professional management of CPRs the book, in fact appears to be addressed primarily to policy makers, managers, or would-be-managers and NGOs interested in intervening from above. Even as Singh talks of involving CPR users in the planning and programming exercise from the outset, his is clearly a top down model of management. He advocates the organisation of CPR users into village resource development and management societies but suggests at the same time that these should be professionally managed by appropriately trained and motivated natural resource managers. Purely member controlled societies he opines cannot function successfully until and unless people are empowered. But the means of such empowerment are supposed to be good education training information financial support etc. The faith placed in good honest benevolent, self enlightened local leadership which is dedicated to the service of the poor and the weak and which is also apolitical for making such societies successful, is noteworthy and equally noteworthy is the passimism underlying the observation that good leaders are scarce and therefore the author fails to see any encouraging prospects for such organisations becoming a major instrument of CPR development in India in the near future (p 326).

NGOs are expected to play a catalytic role in establishing and nurturing people's organisations and making them effective over time and the government is expected to create a facilitative environment for them as well as the CPR users (p 326). NGOs are also supposed to conduct education and training programmes for CPR users (p 93). Even as Singh emphasises in the introduction itself that commercial interests and international agencies have adopted policies which adversely affected the state of common pool resources, the possibility of NGOs being used by these interests to serve their own concerns is not even considered.

Although the author admits that the imperfect knowledge of CPR users is only one aspect of the problem and that they are forced by various economic and institutional factors to behave the way they do so, he nevertheless places enormous hope in education and underlines the relevance of educating the CPR users, the politicians and the voting public about the extent and seriousness of CPR problems and the need for public policy. To suggest that the absence of effective or appropriate policy is because of the lack of awareness of the CPR users and politicians however is to undermine the various structural constraints faced by the former while overlooking at the same time the role of numerous pressures in extracting decisions from the latter. The forces which inhibit the state from pursuing an appropriate policy it may be emphasised, lie in the realm of power relations rather than mere extent of awareness or education of policy-makers and managers.

The assumptions about the policy-project relationship which inform Singh's analysis are not convincing either. For successful implementation of a policy, he considers it necessary that the policy be translated into a set of manageable projects. But in this very act of following project approach, policy is likely to lose much of its meaning from the viewpoint of those who remain uncovered by the project, and, as mentioned earlier also evaluating policy in terms of project success can sometimes be even more dangerous because the costs inflicted by some projects on those who remain uncovered fail to enter the project evaluation charts at all. There remains a third problem with Singh's advocacy in this respect the translation of policy into projects is supposed to be done by professionally trained CPR managers. And this further reduces the role of people in the management of CPRs. There have been numerous instances of people managing their commons effectively without any professional help from outside. It is significant that such experiences are not undermined while certain poorly managed instances become the sole determinants of policy and its implementation.

The most disturbing aspect about the book, however, is its concluding section which outlines a CPRM policy for India. For it tends to almost delink the state of CPRs from the general economic policies which as the author himself emphasised elsewhere, created grounds for the worsening state of CPRs. One wonders if the survival of human and other life systems sustainability and efficiency and equity—the three objectives of CPRM policy outlined by the author—can be attained without introducing correctives at the level of other general economic and developmental policies. Or, if CPRs can at all be saved/managed sustainably without questioning the very model of development being pursued.

Despite these limitations, the book nevertheless deserves a close reading, especially by those not yet into the study of commons' problems as also, by those wanting to acquaint themselves with the existing approaches to their analysis. The jacket cover depicting a badly wounded yet struggling banyan tree effectively captures the plight of CPRs it does well to invite the reader too.

South Africa: End of Apartheid and After

Alex Callinicos

The South African elections of April this year were a world-historic event. The black majority's conquest of citizenship denied them under white rule represented far more than simply the elimination of the last vestiges of formal colonial domination in Africa. It was the culmination of a struggle which the oppressed majority had waged in order to win acceptance of their claim to be recognised as human beings, of equal value to and with the same rights as their oppressors.

What made this miracle possible? More specifically, what caused the head of the apartheid regime, F W de Klerk, to make the momentous decision in February 1990 to unban the ANC and free Nelson Mandela? How had the tortuous negotiations which ensued between the government and the ANC succeeded in achieving the constitutional settlement under which the elections were held? And what will the ANC, victorious at the polls, make of its triumph—in particular, to begin to transform the lives of the black majority?

These are the questions addressed in this article.

'HISTORIC' is one of the cliches of media-speak, readily applied to events—summits and elections, for example—whose point is usually that nothing should change. Every now and then, however, something comes along which can properly be described as of world-historic significance. For Hegel, after all, world history was "the progress of the consciousness of freedom".[1] By that measuring rod, the 1989 revolutions in eastern Europe were world-historic events. So too were the South African elections of April 26-29, 1994.

For the first time the black majority in South Africa voted. Their conquest of the citizenship rights denied them under white rule represented far more than simply the elimination of the last vestiges of formal colonial domination in Africa. It was the culmination of a struggle which the oppressed majority had waged in order to win acceptance of their claim to be recognised as human beings, of equal value to, and with the same rights as their oppressors.

The meaning of the simple act of voting to the vast crowds of black South Africans who queued patiently for hours, even days, was evident enough even to those who could only follow the election from their television sets thousands of miles away. It is well conveyed by one black journalist, Mondli waka Makhanya:

> I like to think I'm a tough guy, the type who only cries at family funerals. But on Wednesday, alone in my voting cubicle, tears clouded my eyes as I held that piece of paper in my hand.
>
> This was not just a vote. It was a spiritual experience. Like the octogenarians who had cast their votes the day before, I felt my humanity had been restored.
>
> I made my cross next to the picture of Nelson Mandela, a man who a few years ago I could only sing about and whose photographs I used to hide at the bottom of the family deep-freeze. As I put my ballots in the boxes I almost suffocated with emotion as I realised the sanctity of the act I was performing. Together with millions of my black countrymen I was completing a journey that began more than three hundred years ago when the white man landed in the Cape and proceeded to strip away my humanity.
>
> This was the end of the nightmare.[2]

But what made this miracle (as veteran anti-apartheid campaigner Archbishop Trevor Huddleston called it) possible? More specifically, what caused the head of the apartheid regime, state president F W de Klerk, to make the momentous decision he announced on February 2, 1990 to unban the African National Congress (ANC) and to free its main leader, Nelson Mandela? How had the tortuous negotiations which ensued between the government and the ANC succeeded in achieving the constitutional settlement under which these elections were held? And what will the ANC, victorious at the polls, make of its triumph—in particular, to begin to transform the lives of the black majority? These are the questions which I address in this article.

I
Crisis of Apartheid

While forms of white domination do indeed, as Makhanya says, date back to the first colonial irruption into what is now South Africa, the occupation of the Cape by the Dutch East India Company in 1652, the system of oppression known as apartheid originates in the development of industrial capitalism slightly over a century ago as the process of colonial conquest was completed. The 'minerals revolution' of the 1870s and 1880s, which followed the discovery of diamonds at Kimberley and gold on the Witwatersrand, led to both the emergence of an extremely powerful group of locally-based mining capitalists, and the elaboration of forms of labour control—in particular the exploitation of large numbers of low-paid African migrant workers housed in company compounds, their movements controlled by a system of pass-laws—of which apartheid represented a more systematic development. The establishment under the aegis of British imperial power of a unified South African state in 1910 represented an accommodation between the two most powerful forces in white settler society, English-speaking mining capital and the Afrikaans-speaking landowners who dominated the countryside, often on a semi-feudal basis. Union was followed by the formalisation of territorial and urban residential segregation. The further penetration of capitalist relations—in particular, the proletarianisation of many rural Afrikaners, and the formation, as a result of the expansion of manufacturing industry between the 1910s and the 1940s, of an urban African working class outside mining—threatened to disrupt the established forms of domination. The election in 1948 of the National Party (NP), champion of the cause of Afrikaner republicanism, at once anti-British and anti-black, marked the victory of a strategy which sought to respond to this challenge in two ways: first, minimising class cleavages among the Afrikaans-speaking majority of whites by consolidating the position of the white working class as a materially and politically privileged labour aristocracy, and using state power to advance the cause of Afrikaner capital in its rivalry with English-speaking business; secondly, extending the existing forms of racial segregation in order to reduce Africans in the 'white' areas (some 87 per cent of the country) to the status of disenfranchised migrant labourers tolerated only to the extent that they performed an economically useful role. The NP's radical segregationism—*apartheid* (separation) as it came to be called—evoked mass resistance led by the ANC, and by the black exclusivist Pan Africanist Congress (PAC) which broke way in 1959. But the regime's ruthless use of repression—most notoriously in the Sharpeville massacre on March 21, 1960—eventually broke the popular movements,

The ANC and PAC were driven underground, and after an unsuccessful switch to armed struggle most of their leaders were either gaoled or forced into exile The triumphant NP proceeded rigorously to turn apartheid into a system of separate development' where Africans right to self-determination was acknowledged only in the form of the Homelands or Bantustans the predominantly rural areas reserved for African ownership after Union whose tribal rulers were now given powers of self government and groomed for eventual 'independence' though it was evident that these new states would remain Pretoria s clients [3]

One way of summing up this process is to say that till the 1960s the system of racial domination proved beneficial to the process of capital accumulation in South Africa given the salience of sectors—above all mining and white agriculture—reliant on highly repressive systems of labour control [4] There after, however the evidence mounted that apartheid was becoming a fetter on the further development of capitalism in South Africa During the 1970s and 1980s South Africa entered a period of profound and chronic crisis Three elements in particular were involved First the South African economy after a burst of secular growth during the 1960s stagnated for much of the following two decades Real gross domestic product rose at an annual rate of 4 9 per cent between 1946 and 1974 in the subsequent decade to 1984 the annual growth rate fell to 1 9 per cent and throughout the 1980s as a whole to 1 5 per cent Among the most serious consequences was the growth in unemployment, estimated by researchers to be running at a rate of about 40 per cent among Africans by the end of the 1980s While the South African economy highly dependent on the world market was seriously affected by the global recessions of the mid 1970s and the early 1980s it became increasingly clear that slow growth was a consequence of the prevailing model of capitalism in South Africa One of the most alarming symptoms of this crisis was the contradiction between the sophistication of the South African economy which emerged from the 1960s boom with a wide range of manufacturing industries reflecting high levels of investment in advanced technology, and its failure to become, like the Newly Industrialising Countries of Latin America and East Asia, a major exporter of manufactured goods Indeed, in key areas such as international trade in machine tools South Africa's position actually deteriorated between the 1950s and 1980s The key earners of foreign exchange remained classically 'colonial' exports of agricultural and mining produce South African manufacturing industries' poor international competitiveness was evident from the low levels of labour productivity, which in turn were often traced back to the restrictions imposed on labour mobility by apartheid [5]

Secondly, the post-war development of manufacturing industry brought about a momentous structural change in socio-economic relations The demand for skilled and semi-skilled workers greatly exceeded the supply of white workers whose monopoly of skilled work was legally entrenched by apartheid measures such as job reservation This monopoly was progressively eroded by the spread of assembly-line production, which replaced the old hierarchy of white craftsmen and unskilled black labourers with a new racial division of labour in which whites moved into supervisory and white-collar positions while blacks dominated semi skilled manual employment The result was a shift in the balance of power between white capital and black labour Black manual workers increasingly required levels of education and training which meant it was now too expensive simply to impose discipline by dismissals and other repressive measures Their discovery of the bargaining power this gave came in a wave of spontaneous mass strikes in the Durban-Pinetown area in January-February 1973 In the next two decades a powerful and militant black trade union movement developed Blacks improved position in the labour market was reflected also in a significant compression of racially based income disparities and in their progressive movement into higher levels of the occupational structure including both routine white collar jobs and even professional and managerial positions [6]

These socio economic transformations underlay the third dimension of the crisis of apartheid the development of semi insurrectionary mass resistance to white rule especially in the urban areas The artificial calm among black South Africans induced by the destruction of the popular movements in the early 1960s was broken on June 16 1976 when school students took to the streets of Soweto the country's largest African township outside Johannesburg The issue which sparked off the rising was a new regulation requiring certain subjects to be taught in the medium of Afrikaans the language of the oppressor, but more profound causes were involved—the confidence instilled by the re emergence of the black workers' movement and by the collapse of the Portuguese colonial empire in Africa the agitation of the Black Consciousness movement (Steve Biko and his co thinkers) the growing tensions within the black school system, which had been greatly expanded to meet employers' demands for more skilled African labour, but which still was subject to the requirements of apartheid 'Bantu education' to prepare pupils for a subordinate role in society Repression initially merely fuelled the school students' anger, and when the rising finally subsided in late 1977, it was clear that the regime had only gained a temporary respite [7]

Under P W Botha, who became prime minister in September 1978, the National Party embarked on a new strategy designed to preserve white domination by conceding limited reforms to a minority of blacks The package had two main components First, a variety of socio-economic measures were adopted in order to enhance the position of black entrepreneurs, professionals, and skilled workers—for example, the legalisation of African trade unions, the abolition of job reservation, and the restoration to blacks of the right to purchase leaseholds and then freeholds in the urban areas The aim of these concessions was to dissociate socio-economic from racial inequalities, and thereby to promote the development of a group of relatively affluent blacks with a stake in the status quo Secondly a new Constitution was adopted in 1983 which created a parliament composed of three chambers, one elected by whites, the other two by each of the minority black communities, Coloureds and Indians Once again the idea was to widen the regime s base The limitation it imposed on white rule was however minimal the White House of Assembly still had the greatest say in key decisions for example in the election of the new executive state president political representation was based on ethnicity and most important of all the African majority remained disenfranchised Hermann Giliomee and Lawrence Schlemmer aptly describe Botha s policy as reform apartheid and sum it by quoting a prominent business leader We Afrikaners must try to find the secret of sharing power without losing control' [8]

Botha s strategy was a classic instance of authoritarian reform and it ran into the standard difficulties faced by such attempts to change repressive regimes from above Far from widening the National Party s base the reforms succeeded in alienating many of its traditional supporters while at the same it fed the black majority s appetite for more fundamental transformations The right wing of the NP broke away over the new Constitution in 1982, and launched the Conservative Party (CP) to defend traditional apartheid It emerged from the 1987 white election as the official opposition with 27 per cent of the vote having picked up support from many poorer whites fearful of black advancement and adversely affected by the monetarist economic policies pursued by Botha which, by running down the public sector, and slashing farm subsidies, reduced key forms of traditional state support for whites At the same time, a plethora of more extreme right-wing organisations emerged, many of them adopting paramilitary tactics and fascist rhetoric, of these the most notorious was the Afrikaner Weerstandbeweging (AWB)

Of far greater significance, however, was the popular opposition Botha's policies succeeded in provoking The reaffirmation

of white supremacy implied by Africans' exclusion from the Tricameral Parliament stimulated mass campaigns against the new Constitution organised by two broad coalitions, the United Democratic Front (UDF) and the National Forum Political militancy was fed by material grievances The enhanced Black Local Authorities which were Botha's one political concession to urban Africans were forced to finance themselves by imposing higher rents and rates at a time when economic recession and rural drought were already placing living standards under pressure Successful boycott campaigns during the elections to these municipal bodies and to the new black parliamentary chambers spilled over into outright insurrection The risings began on September 3 1984 the day the new Constitution came into force, appropriately enough in Sharpeville and the other townships in the Vaal Triangle south of Johannesburg Soon they had spread to the rest of the Pretoria Witwatersrand Vereeniging (PWV) region that is the economic hub of South Africa and to the Eastern Cape traditionally an ANC stronghold The imposition of a State of Emergency in parts of the country in July 1985 did not stem the tide of resistance which indeed spread to the predominantly Coloured townships of the Western Cape in October Black youth—school students and unemployed—were as in 1976 the driving force in the confrontations which continuously took place with the security forces But much more threatening were two other features of the risings First the popular insurgency had a genuinely national character reaching into many remote white country areas and Bantustans Secondly the emerging trade union movement played an increasingly prominent role The legalisation of African trade unions rebounded on the regime The new unions refused their proposed role as a labour aristocracy and began to organise the mass of workers in such key sectors as the mining and metals industries Developing traditions of democratic rank and file control made the unions effective mediums for their members political as well as economic aspirations The formation of the Congress of South African Trade Unions (COSATU) at the end of November 1985 marked the decision of the bulk of the independent unions to use their growing industrial strength for political ends The following years were to see a number of major political mass strikes [9]

Though the risings had developed independently of the exiled ANC, their effect was greatly to enhance its political standing The UDF, which from the start aligned itself with the ANC, emerged as the main anti-apartheid coalition The dominant faction inside COSATU also identified themselves with the ANC The exiled movement's military wing, Umkhonto weSizwe (MK), mounted a growing number of guerrilla actions which won strong support in the townships The regime therefore found itself under increasing external pressure to release Nelson Mandela, whom the risings had helped make a world figure, and to open negotiations with the ANC Tentative steps to map out a basis for talks were made under the auspices of the Commonwealth Eminent Persons Group (EPG) which visited South Africa in early 1986 Botha, first having sanctioned these contacts, broke them off, and imposed a nation-wide State of Emergency on June 12 1986 The scale of the repression was unprecedented By June 1987 over 26,000 people had been detained without trial [10] Death squads organised by the South African Police (SAP) and Military Intelligence (MI) murdered many leading activists Township organisation—the civic associations and youth and student congresses which had sprung up in the early 1980s and which provided the UDF with its backbone—collapsed Insurgent youth and workers whose hopes had been lifted by the risings at their height were reminded of the stark fact that the regime retained an overwhelming advantage in the distribution of military power

II
From de Klerk to Mandela

The risings of 1984-86 marked a turning point On the one hand they established that the black majority could no longer be contained within the framework of apartheid Their organisational resources and political aspirations were now too powerful to be ignored or repressed It soon became clear that the abatement of popular insurgency was temporary The independent unions continued to grow and to mount industrial action under the State of Emergency In June 1988 COSATU and a smaller black federation the National Council of Trade Unions (NACTU) held a successful three day general strike in protest against government plans to tighten up union laws On the other hand, the regime retained considerable reserves of strength During the Emergency many activists drew the conclusion that the popular movement was too weak to remove the existing state by revolutionary means They therefore converged on the strategy long pursued by the ANC leadership of using a variety of tactics—armed struggle, economic sanctions consumer boycotts, strikes—to force the regime to the negotiating table The ANC president, Oliver Tambo, had highlighted his commitment to such a strategy by receiving a delegation of white business leaders headed by Gavin Relly, chairman of the vast Anglo American Corporation, in September 1985, when the township insurrections were near fever pitch

The two sides were at an impasse Neither, it seemed, was strong enough to crush the other An accommodation between the two was, therefore, necessary Botha did not rule out such an option completely Secret negotiations between ministers and Mandela, which had begun during the EPG's unsuccessful mission to South Africa, were allowed to continue Botha indeed appointed a four person committee to deal with Mandela [11] Nevertheless the main emphasis of his final years in office was to use a policy of selective repression and reform to undermine resistance in the townships Change continued to take place in 1986 the system of influx control already fatally weakened by a vast influx into the cities of Africans fleeing rural poverty was abolished But a new *strategy* only emerged after Botha resigned as state president in August 1989, to be replaced by F W de Klerk De Klerk had scant credentials as a reformer As leader of the NP in the Transvaal where pressure from the far right was intense he had been one of the more conservative members of the cabinet The issues which led to Botha's removal had concerned not whether or not to talk to the ANC, but rather the way in which the NP parliamentary caucus and cabinet had been effectively marginalised in decision making while the political influence of the South African Defence Force (SADF) had grown dramatically Nevertheless it was de Klerk who made the great gamble of February 1990, when he unbanned the ANC, PAC and the South African Communist Party (SACP), and freed Mandela

Three elements were involved in this decision First there were the objective constraints on the regime These included not merely the internal political impasse but the deteriorating economic situation The risings of the mid 1980s had caused a collapse of confidence in the South African economy A particularly belligerent speech by Botha in August 1985 provoked a flight of capital from the country a sharp depreciation of the rand and South Africa's default on its debts to western banks Denied access to foreign capital the South African government found itself subject to what *The Financial Times* called a 3 per cent ceiling on economic growth since expanding at a faster rate would precipitate a balance of payments crisis Africa's most dynamic economy is having to be reined in before it can achieve the sort of 5 per cent to 7 per cent growth of which it is theoretically capable, and which is necessary if black unemployment and a nearly 3 per cent [annual] population growth rate is to be absorbed [12] The adoption of sanctions packages by the US and the European Community in 1985-86 indicated that even western leaders as sympathetic as Ronald Reagan and Margaret Thatcher were unable to resist the growing pressure from their electorates to isolate South Africa

The second element in de Klerk's decision is far more impalpable put it was strongly stressed by him and by other NP ministers

such as Roelf Meyer, in interviews during the April 1994 election This was that they had ceased to believe that apartheid was morally defensible One does not have to take these professions of faith at face-value to recognise that one condition of profound political transformations is that the dominant group comes to doubt the legitimacy of its rule Scepticism about Marxist-Leninist ideology was widespread among the Soviet *nomenklatura* well before the collapse of existing socialism In the South African case the Afrikaner business elite who owed their rise to support from the NP controlled state had become increasingly integrated with their English speaking counterparts and therefore more cosmopolitan in their orientation Many Afrikan speaking professionals had also as a result of more sophisticated education foreign travel and the development of a mature consumer society among affluent whites, come to adopt western liberal democratic values and therefore to feel themselves distant from the organic nationalism of NP tradition These changes helped to make the option taken up by de Klerk in February 1990 imaginable

This does not mean that he was embarking on an altruistic surrender of power The third element in his decision was ruthless strategic calculation As Ronald Aronson put it de Klerk s brilliant manoeuvre was to release Mandela unban the ANC begin the negotiations and move to end apartheid *before* he was forced to [13] These moves committed the NP to the establishment of a non racial democracy in which blacks would enjoy—equal citizenship rights with whites Nevertheless de Klerk hoped by seizing the initiative and acting before further uprisings had begun significantly to erode the state s coercive resources, to control the transition and therefore also the terms on which the new democracy was constituted The NP s maximum position in the negotiations was set out in constitutional proposals published in September 1991 These sought to limit the effects of introducing universal suffrage by conceding extensive powers to local and regional governments, and by institutionalising permanent rule by coalition at all three tiers of government [14] De Klerk s methods were different from Botha s but the aim still seemed to be that of sharing power without losing control

Whatever the precise form of a constitutional settlement, plainly the NP's political bargaining power in a future parliament would depend in part on its electoral base De Klerk made determined efforts to win over conservative black opinion Thus substantial elements of the Labour Party, which dominated the Coloured chamber in the Tricameral Parliament were persuaded to cross over to the NP Ministers talked of building a multiracial 'Christian Democratic alliance' against the ANC and its allies in the SACP The key force in African politics which the NP sought as an ally was the Inkatha Freedom Party (IFP) headed by Chief Gatsha Buthelezi, premier of the KwaZulu Homeland Buthezeli had built up the IFP into a mass force claiming by the early 1990s some three million members by appealing to an ambiguous mixture of Zulu traditionalism and conservative African nationalism Earlier on relatively good terms with the ANC and with emergent trade unions, Buthelezi was by the end of the 1970s seen by activists involved in the new resistance movements as an enemy The development of the UDF and COSATU during the mid 1980s in Natal where most Africans are Zulu speakers threatened Buthelezi s base A vicious war developed between UDF and Inkatha supporters in the late 1980s, claiming thousands of lives in the townships and squatter camps of Natal Then in July and August 1990 the violence spread to the PWV region as fighting broke out between the predominantly Zulu speaking dwellers in migrant workers hostels and supporters of the ANC in the townships around Johannesburg [15]

The violence which claimed 7 000 lives between February 1990 and June 1992 far more than had died in political conflicts during all the years of apartheid took the gloss off all the hopes raised by De Klerk s speech and Mandela's release The New South Africa increasingly assumed a most sinister aspect Many politicians and commentators both in South Africa and abroad were quick to seize on the fighting to argue that the architects of apartheid had been right to see Africans as lacking any shared identity and divided into tribes whose ancient conflicts once the restraint of white rule was relaxed were issuing once again into bloodshed This interpretation bore no relationship to the facts The fighting in Natal after all took place between two groups of Zulu-speaking Africans distinguished not by ethnicity but by their political allegiances In Soweto perhaps as many as a third of the population are Zulu-speakers The political division there between ANC and IFP supporters was closely related to the social gulf that has developed between the more settled township inhabitants and hostel dwellers most of them migrant workers or unemployed drawn chiefly from rural Zululand often despised as country bumpkins by Sowetans For this marginal and wretched group of urban Africans Zulu ethnicity offered a way of making sense of an alien and often incomprehensible world and a means of acting on that world the member of a Inkatha *impi* rampaging down a Soweto street Kalashnikov or assegai in hand could feel a sense of power he was denied in everyday life

The conflict between the ANC and the IFP was thus less a tribal faction-fight than a political struggle between two rival nationalisms—the revolutionary non racialism of the ANC and its allies in COSATU and the SACP, and Buthelezi's conservative Zulu nationalism The two sides, moreover, did not meet on a level playing field, where the state acted as an impartial umpire From the beginning of the violence in the PWV, evidence began to accumulate of the complicity of the security forces in IFP attacks on ANC areas The first real corroboration of claims made by the ANC of the existence of a 'third force' based in the state manipulating the violence came on July 19, 1991 when the Johannesburg *Weekly Mail* and the London *Guardian* published documents showing that the SAP had financed IFP activity after February 1990 'Inkathagate' was followed by a flood of revelations about the role played by military intelligence in particular in training arming, and directing IFP supporters It took nearly 18 months for de Klerk to acknowledge on December 19, 1992 that elements in the security forces 'have been involved, and in some cases are still involved in illegal and/or unauthorised activities and malpractices' SADF officers were forcibly retired It was not till the eve of the elections on March 18 1994 that the Goldstone commission appointed by de Klerk to investigate political violence issued a report accusing SAP deputy commissioner Basie Smit and two other police generals of complicity in third force activities The revelations raised the question of how much the state president himself had known of the role of his own army and police in stoking up political violence The Botha era had seen the proliferation of secret agencies controlled by a shadowy network of unaccountable securocrats —for example, the Civil Cooperation Bureau, and the Directorate of Covert Collections both run by MI and the SAP death squad based at Vlakplaas De Klerk told the ANC secretary general Cyril Ramaphosa that these bodies had escaped his control If true this augured ill for a future democratically elected government It may be however that de Klerk had cast a blind eye on activities which had the politically useful effect of disorienting the ANC and forcing its supporters onto the defensive

The ANC leadership meanwhile had to strike a difficult balance between its orientation towards negotiating with the regime and its base in the vibrant democratic mass movements that had emerged in the course of the 1970s and 1980s It was these movements which had forced de Klerk to the negotiating table, but their aspirations towards radical socio-economic change, hostility to the state, and emphasis on democratic decision making and accountability constantly threatened to disrupt the pursuit of a settlement with the government The ANC held its first National Conference inside the country for a generation in July 1991 A new leadership emerged headed by Mandela as president and Ramaphosa (former leader of the miners' union) as secretary-

general with the authority to negotiate. But the ANC rank and file constantly expressed their impatience with their leaders' caution and compromises. For example, the ANC's agreement, in the Pretoria Minute of August 6, 1990, to suspend the armed struggle caused fury among township dwellers suffering the IFP's first great assault on the Rand.

In managing these tensions the ANC leadership were aided by their Revolutionary Alliance, formalised in May 1990, with the SACP and COSATU. The link with the Communist Party dated back to the 1940s. For much of that time, however, the party was a predominantly exile organisation, particularly influential in MK, fiercely loyal to Moscow, and strongly Stalinist in ideology and internal regime. An orthodox Stalinist stages theory, according to which national liberation was distinct to, and took precedence over socialism, provided the SACP with the ideological justification for the alliance. In the early and mid-1980s there were fierce political clashes between SACP supporters arguing that the new unions should integrate themselves within an ANC-led coalition and the so-called 'workerists', who advocated the pursuit of independent class politics and a strategy which linked socialism to national liberation rather than subordinating one to the other. These divisions began to blur as the decade wore on, however, and the ANC's influence inside COSATU grew. The response of the SACP secretary-general, Joe Slovo, to the east European revolutions of 1989—which he made the occasion of a (somewhat belated) critique of Stalinism and the party's previous failure to confront it—had the effect of defusing the suspicions many trade-union activists had previously had of the SACP. Tens of thousands of these activists, including most leading socialists within COSATU, rallied to the SACP after it was unbanned in February 1990. The SACP seemed to be evolving into a relatively open mass party whose ideology was social-democratic rather than Marxist. In the unions also, the view developed that the aim should be, not to expropriate capital, but to use state and union power to contain it and force it to become democratically accountable. The popularity in COSATU of the idea of a 'social contract' implied the development of a process of corporate bargaining in which big business and organised labour sought to define their interests within a collaborative framework regulated by a democratic government.[16]

Nevertheless, as serious negotiations got under way, both the NP and the ANC had to chart a difficult course, since each had to bring along with it a constituency large sections of which were deeply suspicious of the entire process. If Mandela had to cope with a mass base impatient for change and often under severe pressure from Inkatha, de Klerk had to wage a running battle with a far right busy stoking white fears of majority rule. It is not surprising, therefore, that the pursuit of a constitutional settlement should have turned out to be so protracted and tortuous an affair, liable to interruptions which often seemed to threaten to bring the process to an end.

The first round of negotiations proper began on December 20-21, 1991, with the first full session of the Convention of a Democratic South Africa (CODESA). This forum embraced, apart from the principal actors, the ANC and the NP, a wide-spectrum of parties, but on the left the PAC and the Black Consciousness Azanian People's Organisation, and on the right Buthelezi (though not the IFP) and the Conservative Party refused to participate. Intensive discussions in four working groups followed the plenary session (or CODESA 1, as it came to be known). An impasse soon emerged. The crucial issue concerned the nature of the transition to full-blown non-racial democracy. The ANC wanted a rapid establishment of a popularly elected constituent assembly to draw up the new constitution and appoint a democratic government to manage the transition. The NP, by contrast, argued that the bulk of the constitution should be settled by negotiation prior to any elections, and sought a protracted lead-up to democratic rule during which time the country would be governed by a coalition of the main parties—objectives plainly intended to secure disproportionate white influence and to minimise the authority the ANC could claim by virtue of its popular support. The distance between the two sides ensured that the second plenary session, CODESA 2, held on May 15-16, 1992, rapidly deadlocked over the government's insistence that key constitutional clauses should be approved in the constituent assembly by a 75 per cent majority, a measure that would in all likelihood force the ANC to respect the NP's wishes on these measures. In retrospect it is clear that de Klerk overplayed his hand. He had just won an important victory, having secured the endorsement of his policy of seeking a settlement with the ANC from 68.7 per cent of those voting in a white referendum held on March 17. Having defeated the right, de Klerk seems to have thought that he could afford to squeeze the ANC. But, as Colin Eglin of the liberal Democratic Party (DP) later told him, "in politics, it is not clever to win everything".[17]

The ANC reacted to the collapse of CODESA 2 by launching a Mass Action Campaign. This tactic served two purposes: it put pressure on the government to make concessions, and it offered a response to the widespread impatience among the ANC rank and file at the slow pace of negotiations. Already on March 8 COSATU had threatened a campaign of "mass action on an unprecedented scale" unless the NP regime were replaced by an interim government by the end of June. Feelings were further heightened when 42 people were killed by IFP supporters in the Vaal township of Boipatong, amid allegations of security force involvement. The Johannesburg *Weekly Mail* called it "one massacre too many".[18] The slaughter at Boipatong brought the anger and frustration among ANC supporters over two years of bloodshed on the Rand to a head. In the aftermath Mandela announced the ANC's withdrawal from CODESA. Amid an atmosphere heightened by a number of major strikes in the PWV region strategies implying a return to confrontation with the regime—for example, the 'Leipzig Option', a campaign of mass demonstrations designed to bring de Klerk down—were hotly debated in ANC circles.

Nevertheless, the ANC's campaign reached its climax on August 3-4, 1992, with a massive general strike that brought out four million workers—an achievement that was all the more impressive since the black-exclusivist wing of the movement, the PAC and NACTU, opposed the stayaway. Mandela in a speech at a rally outside the Union Buildings, the seat of government in Pretoria, signalled his willingness to return to the negotiating table: "History will not forgive any of us if the search for face-saving formulae prevents us from finding the correct responses which allow negotiations to be successfully resumed". On August 22 the two principal negotiators, Roelf Meyer for the government and Cyril Ramaphosa for the ANC, officially met for the first time since CODESA 2's collapse. The basic equation which had led in the first place to the great break of February 1990 remained valid: neither side saw any alternative to reaching a compromise with the other. Various developments served to nudge the ANC and the NP back towards each other. On July 23 the US under-secretary of state for African Affairs, Herman Cohen, publicly attacked the regime's pursuit of a minority veto, declaring: "All sides must recognise the right of the majority to govern".[19] The west's patience with de Klerk was beginning to run out. On September 7 soldiers of the 'independent' Homeland of the Ciskei fired on ANC demonstrators attempting to march on the Bantustan's capital, Bisho. Twenty-eight people died. Ronnie Kasrils, an ANC/SACP leader seen as a vocal advocate of the Leipzig Option, was widely blamed for tactical errors that helped make the massacre possible; the affair was, therefore, a political defeat for the ANC's more militant wing.[20]

The effective resumption of full-scale talks was marked by a summit between Mandela and de Klerk on September 22, 1992, at which a Record of Understanding was signed. Though the measures the government promised to take against Inkatha in this agreement were not implemented, it was widely seen as a retreat on the NP's part. Meyer and Ramaphosa intensively pursued

discussions in the following months, while a fierce debate developed in ANC circles over the idea—first floated by SACP chairman Joe Slovo—that the ANC accept 'sunset clauses'—temporary concessions to white privilege in the new constitution—as a way of easing the transition. This proposal was accepted by the ANC National Working Party on November 18. The ANC took a further step in the same direction on February 18, 1993 when, after prolonged negotiations and agonised internal discussion, the movement's National Executive Committee approved a proposal for a five-year transitional government of national unity representing all parties which won either 5 per cent or 10 per cent of the vote in elections to the constituent assembly. The ANC had thus accepted temporary power-sharing with the NP. These moves made possible a return to round-table talks among the parties. On April 1, 1993 the first session of the new Multi-Party Negotiating Forum (MPNF) was held. Twenty-six parties were represented, including, for the first time, both the PAC and the Conservative Party.

At this stage, however, the nature of the transition away from white rule remained in significant respects undefined. Two crises in the following year, in both cases involving the intervention of the masses, had a decisive effect in promoting a more democratic solution favourable to the ANC and the oppressed majority. The first of these crises came when Chris Hani, General Secretary of the SACP, was assassinated on April 10, 1993. Janus Waluz, an anti-communist Polish emigre, and Clive Derby-Lewis, a CP leader, were later convicted of his murder. Hani, formerly a senior figure in MK, was the most popular ANC leader after Mandela himself, and had an especially strong constituency among the more radical youth and workers. His death provoked an enormous and convulsive, potentially uncontrollable wave of anger among black South Africans. The ANC alliance mounted various protest actions, including two stayaways. Much more effectively than the previous year's Mass Action Campaign, the popular response to Hani's assassination demonstrated the immense strength of the ANC's support among the black majority: it also indicated the indispensable role of the ANC leadership in channelling and controlling the masses' aspirations for change. Significantly, it was Mandela, not de Klerk, who appeared on television after Hani's death to appeal for calm. Patti Waldmeir of the London *Financial Times* describes the assassination as "permanently tilting the balance in the ANC's favour and allowing them to extract the crucial concession that elections would be held on April 27 [1994]."[21]

Further concessions by the government followed. The Interim Constitution finally approved by the MPNF on November 17-18, 1993 fell far short of the NP's objectives. One-person, one-vote elections to a National Assembly and to nine provincial legislatures would be held on April 26-28, 1994. The Assembly would, together with a Senate consisting of 10 representatives of each province, act as a constituent assembly required to draw up a permanent constitution by a two-thirds majority within five years. During this period, a government of national unity representing all parties with at least 5 per cent of the vote would hold office under a president elected by the Assembly. Similar arrangements would operate at the provincial level. The distribution of powers between provincial and central government favoured the latter. In this and other respects the Interim Constitution favoured the ANC's goal of as rapid as possible a move towards a system of government in which the will of the majority would be subject only to the kinds of restriction normal in liberal democracies, notably an entrenched Bill of Rights. De Klerk at the very last minute made a final stand to demand that the cabinet take important decisions by a two-thirds majority, but Mandela refused to give way. "Power-sharing? Madiba cracked him", one ANC leader commented ('Madiba' is Mandela's clan-name).[22]

There remained, however, one very serious obstacle to a democratic outcome in South Africa. On the far right a coalition of all those forces with a vested interest in the preservation of apartheid emerged. Formed in October 1992 as the Concerned South Africans' Group (renamed the Freedom Alliance a year later), this embraced, on the one hand, Buthelezi and the IFP together with the governments of two 'independent' Homelands, Bophuthatswana and Ciskei, and, on the other, the white far right.

The black reaction to Hani's assassination caused a *grande peur* to sweep through large sections of the white population. At his funeral, Peter Mokaba, leader of the ANC Youth League, led the crowd in chants of 'Kill the Boer! Kill the Farmer!' The next day, on April 21, a Committee of Generals was formed by four retired senior military and police officers headed by Constand Viljoen, former chief of the SADF. Subsequently the Afrikaner Volksfront (AVF) was formed under Viljoen's leadership to unite the highly fragmented white extreme right in opposition to majority rule and to win a white *Volkstaat* (people's state) in which the traditions of Afrikaner nationalism could continue undisturbed. The involvement of such respected military figures as Viljoen make it more likely that armed white resistance to the new Constitution—constantly threatened by the AWB's sinister-comic leader Eugene Terre'Blanche—would take place with the support of elements of the SAP and the SADF. At the same time, the IFP continued to demonstrate its capacity, in both its home base of KwaZulu/Natal and the key PWV region, to cause mayhem. The townships and squatter settlements of the East Rand were the scenes of especially terrible violence between ANC and Inkatha supporters in the course of 1993 and early 1994.

The ANC and the NP, now, along with the other parties to the constitutional settlement, represented on the Transitional Executive Council (TEC) responsible for managing the lead-up to the election, found themselves confronted with an extremely dangerous problem. The Freedom Alliance threatened to boycott the elections—a threat which the governments of KwaZulu, Bophuthatswana, and Ciskei had the power to enforce over a significant portion of South Africa. Moreover, reports proliferated of the involvement of the AVF's burgeoning military wing in training and arming Inkatha units with the aim of mounting armed resistance to the government that would be elected in April. The ANC leadership's response was to involve the Freedom Alliance in further negotiations where they were offered concessions designed to persuade them to end their boycott. On February 21, 1994 amendments to the Interim Constitution were agreed which increased the provinces' powers and recognised white 'minority rights' by providing for a council whose aim would be to explore the possibility of a separatist white *volkstaat*.

The *Weekly Mail* and *Guardian* acerbically commented:

> The Freedom Alliance parties ... had already rejected the concessions. Senior ANC members admitted that they had walked 'yet another mile' to accommodate minority fears. Only the NP was smiling.
>
> The new concessions accepted by the country's negotiators in fact satisfied NP demands more than anyone else's, including the Freedom Alliance parties'.
>
> For the first time the NP will now be able to claim some 'victories' at the negotiating table.[23]

Once again it was the intervention of the masses which decisively tilted the balance of favour of a democratic solution. At the beginning of March growing discontent in the Bophuthatswana Homeland developed into a general insurrection. The regime of president Lucas Mangope had been resisting the Bantustan's reincorporation into South Africa and refusing to allow the elections to be held on its territory. Civil servants and industrial workers went on strike over economic issues such as wages and pensions. They were joined by students, a group with a long history of opposition to Mangope. The turning-point in the rising came when the Bophuthatswana Defence (BDF) and the police mutinied. A desperate Mangope appealed to Viljoen for help. Viljoen sent a force of perhaps as many as 3,000 armed AVF supporters. They included some 500 outright AWB fascists, who went on the

rampage in Mmabatho, the Homeland's Capital The BDF reacted by refusing to obey their government's orders to supply the AVF with heavy weapons, and by driving the AWB off the streets The AVF force's commander, Colonel Jan Breytenbach a veteran of the Namibian war then decided to withdraw from Bophuthatswana Three right-wingers, including an AWB 'general' were killed during the retreat, while television cameras recorded their last moments for a world audience [24]

The consequences of the Bophuthatswana rising were momentous The symbolic significance of the sight of Terre Blanche's strutting storm troopers begging ineffectually for their lives for millions of black South Africans used to countless humiliations at white hands cannot be underestimated The image of the white far right's reputedly awesome power was shattered forever The rising's more immediate practical impact was felt very quickly The SADF intervened in Bophuthatswana to restore order but the Homeland was in effect reincorporated into South Africa under the administration of two commissioners appointed by the TEC Within days the regime of Colonel Oupa Gqozo had been overthrown by a similar rising in the Ciskei Meanwhile General Viljoen already uncomfortable with the extremism of allies such as Terre Blanche and CP leader Ferdie Hartzenburg, broke with the AVF and launched the Freedom Front to contest the elections in order to demonstrate support for a white *volkstaat* The Freedom Alliance hitherto so threatening collapsed like a house of cards

This left Buthelezi still boycotting the elections The formidable threat represented by Inkatha was underlined as violence escalated in KwaZulu/Natal Amid extra ordinary scenes on March 27 eight people died in a gunbattle between guards and 10 000 IFP demonstrators outside the ANC head quarters in Johannesburg But the risings in Bophuthatswana and the Ciskei encouraged the ANC leadership to take a much tougher line with Buthelezi They supported the government s decision to declare a State of Emergency in Natal on March 31, though the very limited deployment of the SADF in the province made little difference to the slaughter 88 people died in political violence in KwaZulu/Natal in the first week of the Emergency[25] In the event it was the tactical skill of key ANC negotiators, notably Ramaphosa and Slovo, which finally broke Buthelezi's opposition to the poll Two steps were crucial First, they (with the help of the NP chief negotiator, Meyer) effectively sabotaged the attempt at international mediation—one of Buthelezi's key demands—by Henry Kissinger and Lord Carrington The rapid departure from South Africa of these two worthies was according to Solvo, "decisive in showing Buthelezi he had reached the end of the road" Secondly, the ANC carefully courted the Zulu king, Goodwill Zwelithini, a figure of enormous symbolic importance to all Zulu-speakers but hitherto thoroughly under his prime minister's thumb offering him the role of constitutional monarch of KwaZulu/Natal and an independent income (Buthelezi had tightly controlled the royal purse-strings) Deserted by his king, and under severe pressure from IFP moderates Buthelezi finally agreed at a summit with Mandela and de Klerk on April 19 to participate in the elections The scene was set for the ANC's triumph [26]

III
Results and Prospects

The actual conduct of the elections was remarkable both for its disorganisation and for the absence of violence The elections were chaotically run so much so that they had to be extended for another day in parts of the country Various factors seem to have been responsible the speed with which the elections were set up, the entry of the IFP only a week before polling and the inexperience and incompetence (and perhaps downright malice in the case of some officials) of the Independent Electoral Commission (IEC) charged with running the whole affair [7] Throughout all the resulting confusion the black masses patiently waited for the moment when they could finally have their say At least they did not have to suffer the paroxysm of killing that had been widely predicted A series of bomb explosions on the Rand during election week did cause 21 deaths, but they came to an abrupt halt when the SAP arrested 32 members of the AWB s paramilitary Ystergarde including several of Terre Blanche s chief lieutenants [8] Far more noteworthy however was the fact that the election proceeded peacefully in KwaZulu/Natal This cast doubt on the claims of those such as the Oxford political scientist R W Johnson (in his case from a standpoint sympathetic to the IFP) that 'Inkatha and ANC forces are equally guilty of killing one another' On this analysis, according to which "the ANC Inkatha battle is a struggle between two equally ruthless brands of African nationalism' one would expect both sides to continue to prosecute the war for territory and votes right up to the end of polling [9] In fact as soon as Buthelezi ended his boycott of the elections, the killing stopped in KwaZulu/Natal which strongly suggested that the bloodshed of the previous months had been a consequence of the chief s strategy of using violence in order to force better terms from the ANC and the NP

The results when they were eventually announced on May 6, delayed by yet more IEC bungling confirmed the ANC's popular mandate Its share of the vote, at 62 6 per cent, was not far short of the two-thirds majority which would have given it a fairly free hand in writing the final constitution The NP came second with 20 4 per cent, Inkatha won 10 5 per cent the Freedom Front 2 2 per cent the Democratic Party 1 7 per cent and the PAC 1 2 per cent [30] The geographic distribution of the different parties votes suggests that to a large extent the electorate polarised along racial lines, Africans voting for the ANC whites for the NP There were however two significant exceptions—the two provinces out of the total of nine which the ANC failed to capture

IFP narrowly won Natal with 51 per cent of the vote the ANC's share was 32 7 per cent the NP s 11 4 per cent The result undoubtedly reflected Inkatha s entrenched position in the province Two other factors, however also played some part First, there was evidence of widespread election fraud an IEC report of Northern Natal cited cases of ballot box stuffing the forced removal of IEC officials and ANC agents from ballot stations in KwaZulu the transfer of voting stations to Inkatha controlled areas and the issuing of temporary voter cards to 13 and 14 year olds by the KwaZulu authorities [31] Secondly the ANC—organisationally divided into three regions in Natal and politically polarised between moderates such as Jacob Zuma ANC candidate for the provincial premiership and militants like the tough Stalinist veteran Harry Gwala—ran a poor campaign The *Weekly Mail* and *Guardian* reported

> The reality is that the ANC failed to mount ongoing door to door campaigns in secure areas with the exception of KwaMashu On election days the ANC failed to get its voters to the polls There were also no ANC party agents at some polling stations in ANC strongholds and in other cases those present were youths By contrast prominent IFP leaders took a central role in getting proper identification for their people and ensuring they got to the polls '

The ANC national leadership decided in any case to accept the result in Natal According to *The Financial Times*

> Local ANC officials are screaming foul play and they are almost certainly right, there were no doubt many petty frauds and perhaps some grand ones in the province But the ANC s national leadership has either decided to accept that its hands too were not clean or more plausibly the ANC simply accepted that it had to concede the province to Inkatha or jeopardise the whole election [33]

The only other province to resist the ANC landslide was the Western Cape Here the NP won 54 2 per cent of the vote, the ANC 33 per cent and the DP heir of the tradition of Cape liberalism a mere 6 8 per cent The NP under the leadership of Hernus Kriel the hardnosed outgoing minister of law and

order, ran a campaign designed to play on the fears of Coloured people, who make up 53 per cent of the province's population. Astonishingly, given the suffering inflicted on Coloureds under apartheid, many of them were willing to forget the past and back the Nationalists. Their readiness to do so may reflect the socio-economic structure of the Western Cape, where Coloureds tend to predominate in the more skilled manual occupations, while Africans, if fortunate enough to be employed at all, are usually found in the lowest-paid jobs. The NP seem to have been able to exploit the insecurities of Coloureds in an area which had since over the past decade a huge influx of Africans into the vast sprawl of squatter camps around Cape Town. Coloureds were encouraged to believe that only by voting NP could they protect their homes and jobs from the invading African hordes.

The NP's appeal to a distinct Coloured identity did not always work. In the Northern Cape, over half of whose population is Coloured, the ANC won 50 per cent of the vote, compared to the NP's 40.7 per cent, and the Freedom Front's 6 per cent. The long-standing patterns of racial domination in this area, long a stronghold of labour-repressive agriculture may have encouraged Coloureds to back the ANC against their white masters. Certainly, in the four predominantly rural northern provinces—the Orange Free State, Northern Transvaal, Eastern Transvaal, and the North-West—the ANC won gigantic majorities. The South African *platteland*, where white landowners had ruled with the sanction of church and state, experienced a political revolution as the rural labourers who had till then been forced to remain silent swept the ANC into office at both provincial and national level. As Mandela told the South African people on April 26, as voting started: "This is your day".

Political revolution took place, of course, at the national level as well: Mandela's inauguration as president on May 10 symbolised this transformation. But to what extent would the assumption of office by the ANC lead to a significant improvement in the lives of the oppressed and exploited majority? The composition of the government suggested a policy of careful reform, in which great efforts would be made to reassure white opinion. The Interim Constitution required the new government be a coalition: the NP's and the IFP's shares of the vote entitled them to cabinet posts. Mandela, however, went further than was required of him, by retaining Derek Keys, the outgoing finance minister in de Klerk's government. *The Financial Times* reported that Mandela made this decision "[d]espite opposition from within his own African National Congress", and that in doing so he

> delighted investors, businessmen and white South Africans ... Nothing else would have persuaded the outside world—not to mention sceptical South Africans—of his commitment to free market economics and political moderation. Again and again, Mr Mandela has stressed the need to restore business confidence and attract foreign investment. Yesterday he took the most concrete steps possible towards achieving those goals.[34]

Indeed, so successful had Mandela's wooing of capital already been even before the election that a poll commissioned by the *Weekly Mail* and *Guardian* of a hundred top business leaders revealed that 68 per cent backed him for president, and opposed to 32 per cent who supported de Klerk.[35] Keys's retention as finance minister was a step towards further consolidating the ANC's relationship with big business. Consistent with the broader policy of reconciliation of which this was part was Mandela's praise at his inauguration for de Klerk, second deputy president in the new government. Mandela invoked the language of African nationalism, calling the NP leader "one of the greatest sons of our soil".[36] The same approach was evident in Mandela's appointment of Buthelezi as minister of home affairs. The bulk of the cabinet, however, was composed of ANC members. Here the distribution of portfolios reflected the influence of what the *Weekly Mail* called "an old-school-tie exile's network", as opposed to the younger generation of leaders who had emerged in the UDF and the unions in the 1980s. Thus Thabo Mbeki, long-standing ANC head of information and foreign affairs, was appointed to the key post of first deputy president and effective prime minister. Ramaphosa the other candidate for the position, chose to stay outside the government and concentrate on his job as ANC secretary-general. Alfred Nzo, his notoriously incompetent predecessor, whom Ramaphosa had ousted in 1991, was appointed foreign minister. Nevertheless, the *Weekly Mail* noted, "[t]here is no evidence that these internal dynamics reflect any ideological or strategic divide—merely a paying of personal debts and pursuit of individual vendettas".[37]

Interestingly, some of the most adventurous appointments were made in the area of economic policy. Alec Erwin, a veteran trade-union leader and perhaps the key intellectual influence on the workers' movement, was appointed deputy finance minister to serve as what one cabinet member called a 'watchman' over keys.[38] In an even more strategic position was Jay Naidoo, ex-general secretary of COSATU, who was appointed minister without portfolio in the state president's office, with responsibility for the Reconstruction and Development Programme (RDP). The RDP was the main economic plank in the ANC's election platform. It proposed a series of measures which during the life of the National Assembly could begin to achieve perceptible improvements in the material situation of the poorest South Africans—for example, the construction of a million houses in five years—without requiring significant increases in taxation or in state regulation of the economy. The funding of the programme was a matter of controversy from the start, with the NP arguing that it would in fact require substantial tax increases. After the election, the National Institute for Economic Policy (formerly the ANC's own Macroeconomic Research Group) came up with estimates according to which the RDP would cost some 135 billion rand (nearly $ 37 billion) over five years, though much of the cost could, the institute believed, be covered from improved public sector efficiency and cuts in apartheid programmes.[39]

The first weeks of the new government indicated the kind of difficulties it now confronted. A report recommending that MPs be paid market-related salaries met with widespread indignation in the unions and the ANC-aligned South African National Civics Organisation. The gap between the 16,000 rand (nearly $ 5,000) a month which MPs would be paid if the report were implemented and the 900 rand ($ 246) basic minimum for public sector workers was simply unacceptable to many ANC supporters. Controversy also surrounded the surge in illegal land seizures by homeless people. Informal squatter settlements had been burgeoning in the PWV region for several years, but many of the homeless seemed to have taken the ANC's victory as cue to occupy empty land. The decision of Johannesburg City Council to destroy a shack settlement at Liefde en Vrede, leaving several hundred squatters homeless on one of the coldest nights of the harsh Highveld winter, caused considerable indignation. The government response was ambivalent. PWV provincial premier Tokyo Sexwale condemned the evictions, but the national housing minister, SACP chairman Joe Slovo, said that some of the land invasions were being orchestrated "by outsiders who do not have the best interests of [the squatters] at heart", and the provincial land ministry claimed that the occupations could "create a climate conducive to 'Third Force' exploitation".[40]

It is easy enough to see disputes of this kind as consequences of the conflict between the policies of a government harshly constrained by circumstances and the unrealistic expectations of its supporters. But things are not so simple. Traditionally the ANC and its allies had drawn a distinction between national liberation and socialism, that is, between political and socio-economic transformation. The struggles of the 1980s had, however, fused the two. The political rhetoric and the forms of organisation that had developed in the unions, the civic associations, and the youth and student

congresses involved giving a social content to political demands; the very mobilising power of these movements arose from their supporters' material grievances as well as their sense of political exclusion. The consciousness that emerged in the 1980s did not vanish in the 1990s. On the contrary, it provided the most powerful impulse behind the ANC's successful electoral campaign. Mandela and his ministers were now trying to restrain the very movement that had brought them to office.

The unions are likely to play an important role in the conflicts which develop in this situation. It is hard to think of another major revolutionary nationalist movement that was as dependent on the organised working class as the ANC has become. The organisational infrastructure provided by COSATU was essential to sustaining the ANC in the late 1980s and early 1990s: community-based organisations such as the civics never recovered from the impact of the 1986 State of Emergency, and the development of ANC branches was disrupted in some parts of the country by the Inkatha terror. The contribution of the unions to providing the ANC with some of its ablest personnel also bears noting. Ex-unionists in the government include not merely Naidoo and Erwin, but Sidney Mufamadi, minister of safety and security. Ramaphosa developed his negotiating skills as a miners' leader. The elections creamed off many other union activists who stood as ANC candidates. The *Weekly Mail* reported:

> No fewer than 50 leaders of the Congress of South African Trade Unions, including the federation's general secretary, seven of its nine regional secretaries and eight secretaries of its affiliate unions, have been absorbed by the national and regional governments.[41]

It does not follow that the relationship between the government and the unions will necessarily be a harmonious one. It is true that, as we have already seen, COSATU moved towards both advocating and participating institutionalised corporate bargaining at the end of the 1990s—a process that began with discussions involving COSATU, NACTU, the NP government, and employers' representatives over union laws, then extended into a broader National Economic Forum, and could be expected to develop further with ANC in office. But the unions were pulled in another direction as well, by their own rank and file, concerned both to defend existing wages and conditions and to secure improvements under the new government. The Transitional Executive Council's appeal for a strike truce during the elections fell on deaf ears. A wave of strikes followed the ANC's victory, notably in the former Homelands and on the mines, reflecting the degree to which workers had been emboldened by the ANC's victory. If popular impatience with the pace of change in the new South Africa emerges it is sure to be reflected particularly clearly within a union movement that has developed powerful traditions of rank-and-file democracy.

Perhaps the best way of summing this up is with the old slogan of the liberation struggle in Southern Africa: *A luta continua;* the struggle goes on. The great risings of the 1970s and 1980s have achieved one great victory. The ANC now has its hands on the levers of political power (though how securely remains to be seen, given the presence of the NP and the IFP in the cabinet, and the fact that the same generals command the army and police as did under de Klerk). How effectively the ANC uses this power is likely to depend on the extent to which the movement which brought it to office remains mobilised fighting to translate the political victory into concrete improvements in people's lives. And within that movement the debates which raged in the 1970s and 1980s—over race and class, socialism and national liberation, workers' organisation and popular coalition—are likely to revive, in new forms, and alongside new controversies as well. The outcome of these debates, and the struggles with which they will be linked is likely to determine whether the hopes raised by the ANC's victory are fulfilled, or whether instead South Africa becomes another case study in the failure of national liberation in the third world.[42]

Notes

[Under the apartheid regime's system of racial classification, the South African people were divided into four main 'population groups': Africans (71.5 per cent of the population); whites (16.6 per cent); Coloureds (9 per cent); and Indians (2.9 per cent). Obnoxious though this terminology is, it is unavoidable when talking about a society still shaped by apartheid. I use 'black' to refer to all those who were defined as 'non-white'.]

Devaluation, Liberalisation and Structural Linkages between India's Foreign Trade and National Income

Sunanda Sen
Hiranya Mukhopadhyay

The structural links between a developing country's foreign trade sector and its domestic economy have a crucial bearing on the results likely to be achieved by trade liberalisation and currency devaluation. These links are often overlooked.

This paper provides a macro model of the Indian economy based on a specification of the structural linkages among GDP, exports and imports, using data for the period 1973-89 and tries to identify the repercussions of trade and exchange rate policy changes on the trade deficit and GNP.

I
Introduction

FOR a developing country the structural links between its foreign trade sector and the domestic economy have a crucial bearing, especially in terms of the results achieved by a package of policy reforms. Typically the latter includes trade liberalisation and currency devaluations. This demands a specification of the nature of these structural links in terms of a macro economic model which takes note of these relations. These aspects however are sometimes overlooked in the available literature.

An attempt is made in the present paper to overcome such lacunae in analysis by providing a macro model of the Indian economy which is based on a specification of these structural linkages between GDP, exports and imports. Data relating to the Indian economy for 1973-89 have been used for the purpose of an econometric testing of the model. The period chosen includes the years of a liberalised regime which began in 1985-86 preceded by the earlier years of a trade regime (1973-74 to 1984-85) when controls were relatively prominent. Liberalisation in India has been marked by both devaluation of the rupee and wide ranging trade decontrols.

The model set up in Section II of the paper specifies the pattern of structural linkages between India's GNP, exports and imports in terms of a simultaneous equation system. The specification, as can be seen from an econometric testing of the model in Section III, enables us to identify the repercussions of policy changes on the size of India's trade deficit and GNP. An attempt has been made to quantify the *net* effect of real depreciation of the rupee (changes in RER) on the three variables in terms of the structural relations specified in the model as a whole. Finally we explore the possibilities of parametric shifts in the functional forms relating to the three respective variables as could result from liberalisation efforts (excluding devaluation) under the liberalised regime. Evidently the exercises situate the recent policy changes in the economy by having reference to the pattern of structural interdependence between the different activities of production, exports and imports.

A crucial aspect of our approach which is reflected in the specification of the model deserves here a special mention. Analysis of the structural links between GDP and foreign trade in this paper rests on the notion that imports and exports can be respectively treated as direct and indirect inputs to the production process in the economy. While imports provide the physical inputs needed for production in the domestic economy, exports indirectly provide for them by procuring the requisite finance from abroad. Treating exports as well as imports as inputs to the aggregate production process indicates a marked departure from the conventional demand deficiency models where foreign trade is reckoned in terms of its demand generating capacity. In India with export earnings or import payments each forming less than 10 per cent of the country's GDP it is probably legitimate to underplay the demand generating/repressing role of the trade balance in the economy. Exports however play a crucial role in providing exchange earnings which supplement the country's import capacity. With moderate to high degrees of dependence on imported inputs the country's production process may thus come to a halt if the flows of imports are interrupted. This is typical in a country with a foreign exchange bottleneck, one where exports serve as indirect inputs to the productive system. With external debt and debt related contractual obligations increasing relative to the domestic output and export earnings, net inflows of external finance tends to taper off. Exports have an additional significance under such situations, by providing the finance needed for additional imports. For a country like India where the potentials of a large home market often remain unexplored because of the difficulties of financing imports which are vital to the production process, exports tend to have significance more as a foreign exchange earner than a demand generating activity.

Viewing foreign trade as a supply (production) augmenting rather than as a demand generating/contracting factor also affects the implications of important policy changes like the depreciation of local currency on the domestic economy. It has been pointed out that devaluation may turn out to be contractionary despite an improved trade balance when a redistribution of output from wages to profits (and rents) in the domestic economy causes an upward shift in the aggregate savings propensity [Krugman and Taylor 1978]. The reasoning however is based on the effects of devaluation on aggregate *demand* than *supply*. In terms of our argument devaluation may turn out to be contractionary by curtailing the availability of imports and hence the supply of aggregate output. This may happen when devaluation causes adverse movements in the terms of trade of the country thus reducing the volume of imports which the country can afford. The sequence has been earlier described by us as an import-led GDP compression which in the present case is triggered off by devaluation [Gylfason 1983 and Sen and Das 1991]. In a similar manner liberalisation measures (other than exchange rate adjustments) also can have contractionary effects on domestic GDP by raising the import content of output when the measures have no positive effect on export earnings. A similar result, without a complete set of explanations has been offered earlier by Edwards (1986) to show the contractionary effect of real devaluation in the short run. The model set up in Section II and the results of the econometric exercise reported in Section III address the following questions:

(a) What are the structural links between domestic output and foreign trade in the Indian economy? Do these provide a basis for treating imports (and export earnings) as inputs to the production process?

(b) Can domestic output be affected by changes in India's real effective exchange

rates keeping in view their impact on trade and the structural links between trade and domestic output?

(c) Can other forms of liberalisation (especially those which affect trade) influence changes in domestic production and trade?

The three issues would be taken up in Section III where the model set up in Section II is put to an econometric exercise

II
A Macro-Model of Structural Linkages in Indian Economy

The introductory remarks provided in the preceding section can now be used to formulate the following model for the Indian economy

$$Y_{dr} = \beta M_r^{\tau},\ \beta,\tau > O \qquad (1)$$
$$M : M(RER,\ X,\ Y_d) \qquad (2)$$
$$X : X(RER,\ XS,\ Y_f) \qquad (3)$$
$$TD : M-X \qquad (4)$$

where

Y_{dr}	=	real GNP of India
Y_d	=	value of India's GNP
M_r	=	real imports of India
M	=	value of India's imports
X	=	value of India's exports
RER	=	trade-weighted index of real effective exchange rate for the rupee
Y_f	=	trade-weighted index of GNp of 20 major trading partners, at current prices
TD	=	value of India's trade deficit
XS	=	export subsidies

While Y_{dr} and M_r are calculated in real units, all other variables, Y_d, M, X and TD are expressed in units of dollar, which is arrived at by converting the current rupee values at current rupee-dollar exchange rates Y_f is obtained in dollar units

The essence of our argument is captured by equation (1) in terms of the output supply function Y_{dr} which depends on the flow of real imports M_r The equation can be rewritten

$$Y_d = \beta M^{\tau} (RER)^{\tau} (pe)^{1-\tau}$$
$$\text{or } \ln Y_d = \ln \beta + \tau \ln M + \tau \ln RER + (1-\tau) \ln (pe) \qquad (1a)$$

The dollar values Y_d and M in equation (1a) has been arrived at by converting the respective rupee values (volume x rupee prices, p) at e, the nominal dollar exchange rate for rupee Equation (1a) specifies, for each 1 per cent rise in RER, the percentage change in Y_d, given by τ provided p and e remain constant Evidently, Y_{dr} would also be subject to the same order of change as long as changes in (pe) are ruled out

Equations (2) and (3) provide the functional forms of the import and export value equations RER provides the role of a price relative between domestic and foreign goods in both functions A depreciation of rupee, indicated by a drop in RER, would exercise a price-effect the direction (sign) of which may turn out to be different for exports and imports when the commodities face an elastic demand The standard behavioural impact is captured by Y_d and Y_f in the respective equations for M and X X, the value of export earnings influence dollar value of imports in equation (2) by providing the requisite foreign exchange In equation (3), XS, the level of export subsidies influences the level of export earnings by changing their competitiveness TD, the dollar value of trade deficit is spelt out in the identity given by (4)

The model can be used to test the impact of policy changes like devaluation on Y_d, X and M In equations (2) and (3) the coefficients to RER indicate the partial elasticity of the respective M and X functions *vis-a-vis* changes in RER The overall impact on the three separate variables would however be determined by the pattern of interdependence woven in terms of the structural linkages in the model

The following is now offered as a testable model

$$\ln Y_d = \beta + \tau \ln M + \tau \ln RER + (1-\tau) \ln (pe) + \tau_1 D \qquad (5)$$
$$\ln M = \alpha_0 + \alpha_1 \ln x + \alpha_2 \ln Y_d + \alpha_3 \ln RER + \alpha_4 D \qquad (6)$$
$$\ln x = \theta_0 + \theta_1 \ln Y_f + \theta_2 \ln RER + \theta_3 \ln xs + \theta_4 D \qquad (7)$$
$$TD = M-x \qquad (8)$$

where the dummy variable D is 1 for the period 1985-86 to 1989-90 D captures the impact of liberalisation which began during the period 1985 86 The entire period 1973-74 to 1989 90 as mentioned in Section I can be broken up into a trade-regime in India during 1973 74 to 1984-85 and a second period which relates to the years of 'liberalised regime since 1985-86 While data for 1990-91 and 1991-92 are available there is evidence that imports were artificially restricted by measures like trade credit restrictions This invalidates the functional form specified for our import function during these years and we have excluded these years from our empirical exercise

Equations (5) and (6) constitute a simultaneous equation structure where the parameters can be estimated by 2SLS subject to the restrictions on parameters of equation (5) However multicollinearity problems arise in equation (6) which may be due to the simultaneous existence of X, Y_d and RER This can distort the signs of the coefficients The problem has prevented us from using the 2SLS method Instead we prefer to carry out an indirect least square technique in order to estimate the reduced form parameters The corresponding equations are

$$\ln Y_d = \mu_1 + \mu_2 \ln RER + \mu_3 \ln x + \mu_4 \ln (pe) + \mu_5 D \qquad (9)$$
$$\ln M = \delta_1 + \delta_2 \ln RER + \delta_3 \ln x + \delta_4 \ln (pe) + \delta_5 D \qquad (10)$$

where

$$\mu_1 = \frac{\beta+\tau\alpha_0}{1-\tau\alpha_2},\ \mu_2 = \frac{\tau(1+\alpha_3)}{1-\tau\alpha_2},\ \mu_3 = \frac{\tau\alpha_1}{1-\tau\alpha_2},$$
$$\mu_4 = \frac{(1-\tau)}{1-\tau\alpha_2}$$
$$\delta_1 = \frac{\alpha_0+\alpha_2\beta}{1-\tau\alpha_2},\quad \delta_2 = \frac{\alpha_3+\alpha_2\tau}{1-\tau\alpha_2},$$
$$\delta_3 = \frac{\alpha_1}{1-\tau\alpha_2},\quad \delta_4 = \frac{\alpha_2(1-\tau)}{1-\tau\alpha_2}$$
$$\mu_5 = \frac{\tau_1+\tau\alpha_4}{1-\tau\alpha_2},\quad \delta_5 = \frac{\alpha_2\tau_1+\alpha_4}{1-\tau\alpha_2}$$

It may be noted that δ_2 in equation (10) represents net percentage change in M for 1 per cent change in real effective exchange rate (RER) holding X and (pe) constant However, x is also a function of real effective exchange rate, therefore, total change would be higher or smaller than δ_2 depending upon the elasticity of real exports with respect to RER (which determines the sign of θ_2) Furthermore, δ_2 can be decomposed into two parts, namely, direct impact of RER on M (which we may call 'price effect') and change in M due to change in India's nominal GNP (US $), which we propose to call 'income effect' μ_2 represents net percentage change in real output (holding (Pe) constant) due to 1 per cent change in RER

TABLE 1 PERCENTAGE CHANGES IN RER, ESTIMATED IMPORTS AND ESTIMATED REAL OUTPUT

Year	RER	Estimated Imports	Estimated Real Output
1980 81	11.42	5.90	5.25
1981-82	1.99	1.05	0.91
1982 83	−4.09	−2.19	−1.88
1983 84	1.84	0.97	0.84
1984 85	2.00	−1.06	−0.92
1985 86	−2.72	−1.45	−1.25
1986-87	−7.80	−4.21	−3.58
1987 88	−7.37	−3.97	−3.39
1988 89	−3.74	−2.00	−1.72
1989-90	−4.62	−2.47	−2.12
1990-91	−2.29	−1.22	−1.05
1991-92	−12.40	−6.77	−5.70

Notes (1) Estimated imports and real output show percentage changes in imports and real output caused by changes in real effective exchange rate with a *ceteris paribus* assumption relating to other independent variables These have been estimated by using equations (11) and (12) after substituting equations (13) for lnx

(2) Imports are measured in US $

(3) A negative sign in column 2 indicates depreciation

The OLS estimates (with t value in parentheses) are as follows

$$
\begin{array}{llll}
\ln Y_d = & -7.23 & +\ 0.72 \ln RER & \\
 & (-3.20) & (2.12) & \\
 & +\ 0.71 \ln X & +\ 0.53 \ln (pe) & +\ 0.22\, D \\
 & (4.21) & (2.34) & (4.56)
\end{array} \quad (11)
$$

Time period 1973-74 to 1989-90, $R^2 = 0.98$, $\bar{R}^2 = 0.97$, Lagrange Multiplier Test of first order serial correlation, $F(1, 11) = 0.02$

$$
\begin{array}{llll}
\ln M = & -5.44 & +\ 0.82 \ln RER & \\
 & (-2.96) & (3.12) & \\
 & +\ 0.80 \ln X & +\ 1.14 \ln (pe) & +\ 0.12\, D \\
 & (6.15) & (6.58) & (3.15)
\end{array} \quad (12)
$$

Time period 1973-74 to 1989-90 $R^2 = 0.99$, $\bar{R}^2 = 0.97$, Lagrange Multiplier Test of first order serial correlation $F(1,11) = 0.08$

$$
\begin{array}{llll}
\ln x = & 7.08 & +\ 0.72 \ln Y_f & -\ 0.37 \ln RER \\
 & (6.67) & (10.58) & (-1.96) \\
 & +\ 0.13 \ln (XS) & -\ 0.21 D_1 & \\
 & (2.31) & (-4.66) &
\end{array} \quad (13)
$$

Time period 1973-74 to 1989 90, $R^2 = 0.98$, $\bar{R}^2 = 0.98$, Lagrange Multiplier Test of first order serial correlation, $F(1,11) = 0.58$

III
Interpreting the Results

Several comments are in order to interpret the various parameter estimates in equations (11) – (13) First D which can be called the liberalisation dummy has been found significant for both output and import functions, respectively provided in equations (11) and (12) A positive and significant coefficient for D in either equation indicates that liberalisation efforts since mid-80s could favourably affect output when their impact on imports were also favourable Positive influences on Y_d and M (both dollar values) also indicate similar impact on the real variables Y_{dr} and M_r as long as RER, and (pe) are all held constant (The reader may recall the transformation of Y_{dr} to Y_d in equation (2)) In absence of additional export earnings, the rise in imports were debt-financed, a point which we would take up later while interpreting the deviations between actual and estimated TDs The point is all the more relevant as we observe the insignificant coefficient of D in the export function However, extraneous forces like the stoppage of crude oil from India in April 1985 (following the setting up of domestic refineries) make it meaningful to incorporate an additional dummy variable D_1, in equation (13) with value 1 for 1985-86 and 1986-87 Effects of RER on X indicate a negative and significant coefficient, implying that real exports from India are price elastic However the RER-import relation cannot be empirically checked because of a mis-match between the reduced form parameters and the structural parameters This prevents us from obtaining an unique solution for α_1 in equation (6) which is crucial to check the partial elasticity of real imports with respect to RER. The rather opposite movements in RER and M except during 1979-80 to 1984-85 (see the Figure) can possibly be interpreted by the intuitive reasoning that in India real demand for imports had been price (and hence RER) inelastic over the period

The crucial parameters τ and τ_1 in the structural equation (5) can now be obtained by estimating the equation using the 2SLS method, subject to the restrictions on the parameters The estimated equation with t-values in parentheses are given as follows

$$
\begin{array}{llll}
\ln Y_d = & -3.90 & +\ 0.45 \ln M & +\ 0.45 \ln RER \\
 & (-3.20) & (3.99) & (3.99) \\
 & +\ 0.55 \ln (pe) & +\ 0.29\, D & \\
 & (4.69) & (4.75) &
\end{array} \quad (14)
$$

Time period 1973-74 to 1989 90
DW = 1.62 R^2 (between observed and predicted) = 0.94

Holding the other variables (M and pe) constant, 1 per cent rise in real imports would, in terms of equation (14), bring in a 0.45 per cent increase in real output a result which is revealing

Tables 1 and 2 provide the results of a simulation exercise where the estimated values are arrived at by using equations (11) and (12) after substituting equation (13) for lnx, with a *ceteris paribus* assumption relating to other independent variables in these equations, estimates are provided for annual percentage changes in M, Y_d and TD caused by actual percentage changes in RER during the years 1980-81 to 1991 92

The major finding of the simulation results reported in Tables 1 and 2 relate to the net effects of the annual depreciations in the real effective exchange rate of the rupee on domestic real output and the dollar value of India's trade deficit during each year A reduction in the estimated size of the trade deficit, achieved through a cut in import volume, explains the simultaneous drop in the estimates for real output Thus real depreciation achieves an improvement in trade balance at the cost of domestic growth—a sequence which is based on the theme of an import led GDP compression in a foreign exchange constrained as well as import dependent economy The process also describes the possibilities of devaluation leading to a GDP contraction—for reasons which have been discussed earlier The simulations exercises incorporate the various causal relationships which often move in opposite directions For example while a drop in RER reduces output, a simultaneous increase results in dollar value of imports (provided real demand is price inelastic) and in dollar value of exports (provided real demand abroad is price elastic) The rise in dollar value of exports is likely to increase dollar value of imports while the reduced dollar value of output would reduce imports in dollar

Aggregate effects of a real depreciation (or appreciation) on real output and the trade deficit in dollar terms are thus rather complex in terms of the functioning of our structural model A simplistic approach, by calculating the partial elasticity of the trade variables *vis-a-vis* RER thus leads to false diagnosis as well as solutions

Attention needs to be drawn, before offering our concluding observations, to the disparity in Table 2 between the actual and the estimated annual dollar values for trade deficits Actual trade deficit narrowed by a margin which was much smaller after 1985-86 compared to the narrowing of the estimated trade deficit Since the latter was calculated on the basis of changes in RER alone, the deviations can be related to simultaneous changes in the remaining variables, and especially in D which acquired an explanatory power during the liberalisation regime' Debt-financed imports were rather common during the late 80s [Mundle and Mukhopadhyay 1993, Sen 1994] But for the 'changes' initiated in the economy as liberalisation package and also in the remaining variables which include both domestic prices (P) and foreign income (Y_f) throughout the entire period, actual trade deficit could have been narrower as indicated by the estimated numbers

IV
Concluding Observations

What then is the upshot of the preceding exercise in terms of the relevance of the structural linkages in the Indian economy for trade and exchange rate policies?

The major finding of this paper relates to the need to consider the structural linkages between different sectors including foreign trade As pointed out in our study, these

TABLE 2 PERCENTAGE CHANGES IN RER ACTUAL TRADE DEFICIT AND ESTIMATED TRADE DEFICIT

Year	RER	Actual Trade Deficit	Estimated Trade Deficit
1980 81	11 42	118 82	43 56
1981-82	1 99	−12 36	5 61
1982 83	−4 09	−12 21	−11 23
1983-84	1 84	3 20	5 51

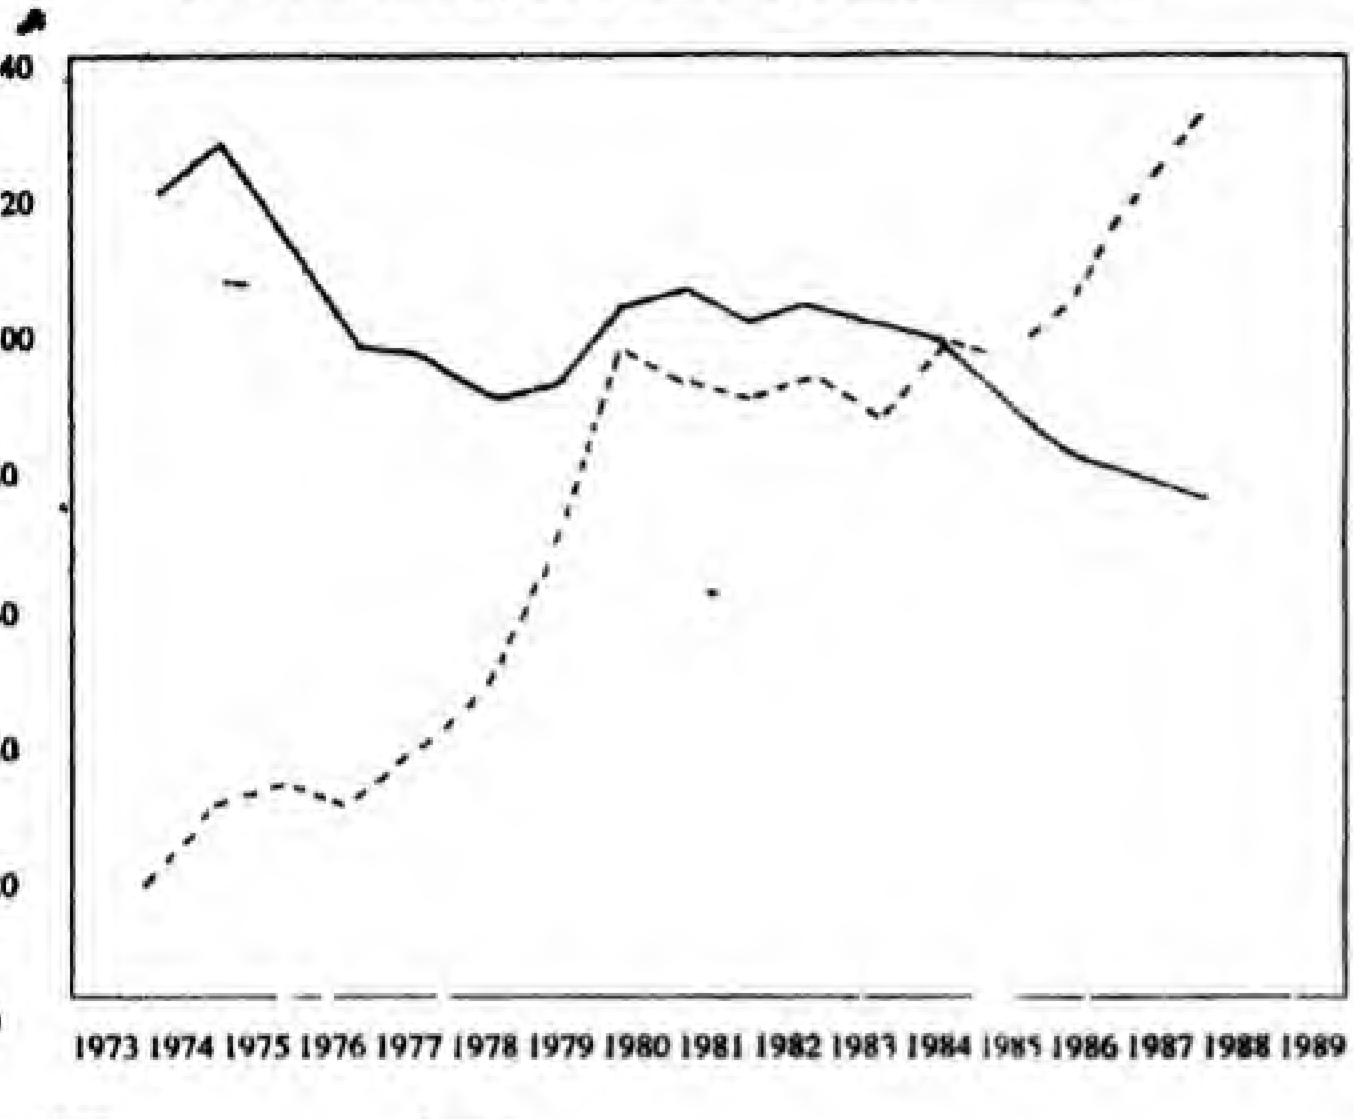
Notes (1) Trade deficit is measured in US $
(2) Estimated trade deficit shows percentage changes in trade deficit due to percentage changes in real effective exchange rate holding all other exogenous variables constant

FIGURE INDICES OF IMPORTS (US $) AND REAL EFFECTIVE EXCHANGE RATE



structural links are of crucial significance in determining the impact of policy changes in the economy. To be specific, our study indicates that in India imports have a crucial bearing on the growth rate of output—presumably because of the nature of imports which mostly consist of raw materials and intermediates needed for production. A tendency observed during the liberalisation regime since 1985-86, for an added degree of this functional dependence between imports and GDP is borne out by results which indicate upward shifts in both import and output functions during these years. Evidently the increased level of imports contributed to additional output. Data for 1990-91 and 1991-92 indicate a reverse process with simultaneous declines in both imports and the GDP.

This paper does not analyse the implications of changes in the capital account of the country's balance of payments as resulted from liberalisation. Resort to debt financing during the late 80s when imports rose very fast resulted in steep increases for debt services. The debt difficulties led, during the 90s, to a GDP compression which was triggered off by a slowing down of imports.

The other important finding of this paper relates to the implications of major instruments of trade policy like devaluation for the economy. Unlike what is usually postulated in the literature, effects of devaluation on the country's trade deficit and the GDP are determined by the interplay of a structurally interdependent system, thus ruling out the relevance of the simplistic exercises implicit in partial approaches.

The net effect of changes in RER on domestic output and trade deficit would depend on the individual effects on imports, exports and output which work on each other. Evidently the structural linkages between the dependent variables and the relation of each to the policy-instruments or other parameters are both crucial in determining the final effect of RER. While our estimates indicate a narrowing of trade deficit at the cost of growth during the period, the story cannot, for obvious reasons, be treated as universal. Thus RER may have a very different impact on GDP and the trade deficit when the structural links and the functional forms of these variables are different.

In our analysis we have stressed the need to treat both imports and exports as essential inputs to the productive process. The approach, which deviates from the demand generating/contracting role of foreign trade is based on the structural dependence of GDP on imports and of the latter on export earnings. The possibility of a 'devaluation-led contraction' in our model arises out of supply (and not demand) adjustments. We have observed that in India devaluation has narrowed the size of the trade deficit. However, the actual narrowing has been much less compared to the estimated net RER effects in terms of the model. This presumably is related to the operation of factors like liberalisation or debt-financed imports which pushed up imports.

Finally, as a note of caution we stress the need to consider the changes in the country's balance of payments as a whole. The difficulties of maintaining and sustaining debt-financed imports are not captured by the model. A complementary analysis, specifying the exact pattern of adjustments between the current and capital accounts is needed to understand the full impact of policies like exchange rate adjustments and liberalisation.

Data Appendix

Data used to test the model include the time series for the respective variables for the years between 1973-74 and 1989-90. Sources for Y_d, M and X are *Economic Survey* of the government of India for the relevant years. Rupee values at current prices have been converted to dollar at the prevailing exchange rate. For Y_r, the data source is *International Financial Statistics* of the IMF. Data sources for XS goes back to the Ministry of Commerce, government of India. The data on real effective exchange rate (RER) have been obtained from the *Reserve Bank of India Monthly Bulletin* July and November 1993. The real effective exchange rate is the nominal effective exchange rate for the rupee based on total trade weights of 36 countries deflated by the effective relative price between India and its trade partner countries based on the same weights. See also *Economic and Political Weekly* January 15, 1994 for a rigorous discussion on the construction of NEER and REER indices by various authors and the Reserve Bank of India.

[The authors are grateful to D N Rao who was instrumental in initiating an earlier draft of this paper. Thanks are offered to Vijay Singh who collected data for export subsidies and Pramila Rajbanshi for efficient typing. The econometric testing of the model was designed and worked out by Hiranya Mukhopadhyay. The authors however are jointly responsible for the paper as a whole and for the errors which have remained.]

Trade Union Participation and Development of Class-Consciousness

Pravin J Patel

This paper attempts to examine the assumption that the trade union is a school of class-consciousness. Two qualifications are added to the original Marxian proposition: (a) that the more active participation in the trade union activities the greater the class-consciousness, and (b) that the leftist/radical ideological orientation of the trade union is likely to generate greater class-consciousness than rightist/reformist ideological orientation.

ACCORDING to Karl Marx a person's class-position is determined by his/her production relations, that is, by the fact whether the person owns the means of production or not. Hence class-interests of the employers and the employees are mutually opposed, whether they are aware of the fact or not.

Marx asserted that ruling bourgeoisie class exploits the working class and sustains an unequal system not only by force but also by spreading an ideology that justifies the class-inequality. He further postulated that in due course of time, however, the working-class will develop a true consciousness and realise that its miserable condition is not due to its own failure but is the result of an unjust system.

Marx made a distinction between the objective class-situation of people and their subjective awareness of it, by giving the concepts of 'class in itself' (klasse an sich) and 'class for itself' (klasse fur sich). So long as a class is not subjectively aware of its objective position within the production relations it remains a category, a 'class in itself'. By becoming conscious of its objective position, it becomes a 'class for itself', it transforms itself into a community capable of acting in unison.[1]

Marx was aware that some social groups do not have the potential for becoming fully developed 'class for itself' in spite of the fact that they share common class-interests in the system of production. He illustrated this point by an example of the small-holding peasants of France of his time, who used their voting rights against their own interests and allowed themselves to be subordinated.[2] However, he prophesied that unlike the French peasants, the industrial proletariats would inevitably become a self-conscious and organised class. Because, the conditions of life in the factory bring the workers together in such a way that they become aware of their common interests and the strength of their unity.[3]

Yet, the evidence from the industrially developed nations does not reveal a very clear pattern of the development of class-consciousness. For instance, it is generally found that people at the higher echelon of social stratification often act to further their own interests and manipulate the system to their own advantage.[4] But the findings regarding working class-consciousness are not consistent. Some researchers have observed that the industrial workers simultaneously hold radical views along with right-wing or conservative opinions, betraying thereby contradictions in their consciousness.[5] Thus they conclude, the workers have not fully developed as 'class for itself'. To explain this phenomenon an embourgeoisiement thesis is also being advanced, based on the argument that increased affluence of industrial workers has an adverse effect on their class-consciousness.[6] But there is no consensus about this thesis among scholars.[7]

On the other hand, however, some studies have revealed the development of class-consciousness among the workers. For instance, in a study of Detroit workers of the US, Leggett found that some sections of working-class do develop a feeling that they are exploited by the system.[8] Some researchers have also attempted to analyse the relationship between objective class-position and class-consciousness.[9] However, there is a considerable lack of consensus among the researchers on this issue. Reviewing such studies Kluegal and Smith conclude that most of these studies catalogue only weak relationships between the perceiver's social or economic position and his/her class-consciousness.[10]

Qualifying Marxian Thesis

However, most of these studies ignore the fact that apart from the objective class-position of workers, Marx also postulated the role of trade unions as a school of solidarity and socialism.[11] In other words, in Marx's theoretical scheme objective class-position is a necessary, but not sufficient, condition for the development of class-consciousness. Marx's early political views were being formulated in an epoch when trade unions were in a formative stage. The fact which seems to have impressed him immensely was that the scattered and mutually competing workers were beginning to unite and form unions to build a resistance against their exploitation. Therefore, Marx considered these trade unions as a school of solidarity and socialism, which provided the workers primary 'class training'.

Engels, even before Marx had observed that as schools of class-war, the unions were unexcelled, and that the experience in trade union participation enhanced workers' self-confidence and class-consciousness.[12] Marx and Engels, however, distinguished the economic movement from the political movement of the working-class, since the objective of the former is to win economic benefits for the workers, whereas the latter has a political goal of establishing a classless society by overthrowing the exploitative capitalist system.[13] But, they assumed that whatever economic goals the trade unions may pursue, there are inevitable political repercussions of such pursuits, whether intended or not. Thus, in their view a trade union was not merely an organisation to redress the workers' grievances, but also a setting for a more general process of socialisation in the class-consciousness. As workers solve their immediate problems through trade unions, they also learn in the process radical attitudes and values, that is, new dispositions to act. But like many other postulates of Marxism this one is also not clearly specified. In fact, in the writings of Marx and also of Engels, we find a contradiction in their vision of the ideal role of trade unions and their evaluation of the actual role of these unions of their time. They were aware of the shortcomings of the European trade unions of their time. They noted that unions had become the preserve of a labour aristocracy and that workers were corrupted by the fruits of colonial exploitation. They also knew that the short-term interests of particular workers could come into conflict with the long-term interests of the whole working class.[14] In spite of this, they retained an optimistic conviction that the working-class would eventually become class-conscious and would enhance its interests by organising a revolution with the help of radical intellectuals. According to them this revolution would be possible by an alliance between the trade union movement and a radical political party. Thus in addition to the trade union, Marx and Engels also emphasised the role of a political party committed to the radical ideology for bringing a revolutionary transformation in the existing capitalist system.[15]

This view is shared by the later-day neo-Marxists like Lukacs and Gramsci. Lukacs, for instance, states "...class consciousness implies class-conditioned unconsciousness of one's own socio-historical and economic conditions".[16] However, this, according to him, will be overcome in the capitalist society by a revolutionary movement. Similarly, Gramsci also asserted that though the dominant class does succeed in thwarting the development of true consciousness among the workers, the radical intellectuals will play a vital role in creating the revolutionary ideology which will ultimately percolate to the masses of the workers.[17]

Objective of Study

In this study, therefore, we will attempt to empirically examine the theoretical assumption of Marx that the trade unions are schools of class-solidarity and socialism, i e, class-consciousness. However, while doing so we have specified that the influence of the trade unions on the development of the class-consciousness among the workers cannot be uniform for at least two main reasons.

First of all, it is an empirical fact that all members of a trade union do not equally actively participate in its affairs and, therefore, they need not be expected to internalise the behavioural dispositions, attitudes and values indicating class-consciousness in the same degree.

Secondly, it would be naive to assume that all unions explicitly work towards the creation of class-struggle. In reality we find that all trade unions do not espouse the Marxist ideology of class-conflict, and, therefore, all of them do not make explicit efforts to educate the workers in this regard. Instead, those unions opposed to this ideology try to inculcate opposite values of industrial peace and class harmony. Hence, we also expect to find variations in the internalisation of those values among participants, according to the ideological dispositions of the unions they belong to.

The Method

We first operationalise the concept of working class-consciousness and then give an account of the trade union situation of Vadodara in connection with the procedure of data-collection.

To Marx, class-consciousness means politically expressed economic group-interest of a class. This subjective awareness, which is known as class-consciousness, implies that the members of a class perceive their own class as distinct; that they develop a feeling of identification with fellow class members and a feeling of difference from and opposition to the other class; and that they possess a capacity to act in unison to pursue collective interests of their own class. When an objective class, that is 'class in itself', develops this kind of subjective class-consciousness it becomes a 'class for itself'. In this sense the concept refers to the consciousness of both the classes, namely, the bourgeoisie and the proletariat. However, we are here concerned only with the consciousness of the working class.

There have been a number of attempts to clarify the dimensions of class-consciousness. While operationalising the concept, some researchers merely try to investigate the awareness of respondents of the existence of classes, by asking such simple questions as the class to which they belong or how many classes, according to them, exist in their community or society. An early effort in this direction was made by the Lynds in their study *Middletown in Transition*.[18]

But working class-consciousness, like many other concepts, cannot be adequately indicated by a single characteristic because it is manifested in a variety of ways. It is a complex of qualities rather than a single trait. Of late, however, efforts have been made to clarify the different dimensions of the concept in greater detail. One such attempt is made by Manis and Meltzer in their study of attitudes of textile workers to class-structure.[19] They tried to measure class consciousness on the following seven criteria: (i) saliency (whether class occupies a significant position in people's minds), (ii) awareness (whether social classes exist in their community), (iii) number (number of classes in existence), (iv) composition (people belonging to these classes), (v) relationship between classes (whether the classes get along with each other), (vi) sense of belongingness (whether people in each class stick together), and (vii) permanence (whether class lines are hardening).

However, as Oscar Glantz rightly observes, class-consciousness means more than mere awareness or one's economic position.[20] It should be "accompanied by class-related politico-economic values". Individuals, according to Glantz, can be called class-conscious only if they are aware of their politico-economic interests in such a way that they recognise their unity with others belonging to their class, and also the general nature of class in opposition. Therefore, Glantz chose two indicators to measure class-consciousness (i) allegiance: self-identification with one's own class, and (ii) orientation: (a) favourable orientation to one's own class (by accepting the values of one's class) and (b) unfavourable orientation to the antagonistic class (by rejecting the values represented by it), revealed by positive or negative responses to pro-labour/pro-business statements.

Two other significant efforts to operationally specify the concept of class-consciousness are made by Lazarsfeld and Leggett respectively. Lazarsfeld operationalised the concept of class-consciousness by taking a typical Austrian worker, i e, a typical member of the Social Democratic Party, as a frame of reference. He categorised

Table 3: Classification of Prominent and Non-Prominent Activists according to Degree of Class-Consciousness (in Terms of T Statistic Sample (N), Mean ($\bar{X}$), Standard Deviation (SD) and the Z Value)

	Prominents	Non-Prominents
N	110	312
$\bar{X}$	12.04	10.93

consciousness into the following four dimensions (i) symbolic or emotional (ii) distrust of class enemies (iii) all-embracing life style and (iv) political militancy [21]

Leggett defined working class-consciousness by identifying the following four dimensions (i) class verbalisation tendency to discuss issues in class terms (ii) skepticism belief that wealth is distributed mainly to benefit the middle classes (iii) militancy disposition to engage aggressively in action to advance the interests of one's own class and (iv) egalitarianism favouring a redistribution of wealth in such a way that each individual would have the same amount (so that there would be equal chances to get ahead) "

It would be interesting to note that the two dimensions highlighted by Leggett namely skepticism and militancy are identical to Lazarsfeld's "distrust to class enemies and 'political militancy Lazarsfeld, however defined militancy as the workers commitment to form a separate labour party while Leggett interpreted it as working-class aggressiveness to advance its interests Leggett's dimension of egalitarianism is not found in Lazarsfeld's analysis whereas Lazarsfeld's dimension of all embracing life style is absent in Leggett's formulation

From these efforts to operationalise the concept of class consciousness we identified the following three dimensions of working class consciousness for our purpose (a) class solidarity (b) economic radicalism and (c) class militancy

Class-Solidarity

This dimension of class solidarity is closer to Lazarsfeld's 'distrust of class enemies and Leggett's verbalisation and 'skepticism It is defined in our analysis as a belief of workers that all proletariats belong to one class and that the bourgeoisie who belong to the other class are their enemies The presence or absence of class-solidarity is measured with the help of an index comprising of six statements with structured and dichotomised responses, that is the responses could be affirmative or negative only In some cases an affirmative response indicated the presence of solidarity whereas in some other a negative response indicated that The responses were converted into numeric codes which are shown in the brackets below, along with the statements Numeric code zero shows the absence of solidarity in the respondent and code one indicates the presence The statements used to measure class-solidarity are (i) Relationship between employers and employees is like that of parents and children (Agree=0, Disagree=1), (ii) Workers are actually not exploited by the employers but by the managerial officers (Agree=0, Disagree=1), (iii) Manual labourers and clerical personnel belong to the same economic class (Agree=1, Disagree=0), (iv) Interests of the industrial workers are different from those of the agricultural workers (Agree=0, Disagree=1), (v) Owners of the factories unwillingly tolerate the trade unions, if they are given freedom they would crush them (Agree=1, Disagree=0), (vi) The interests of the workers and the industrialists are the same (Agree=0, Disagree=1)

Economic Radicalism

This constituent of class consciousness is similar to Leggett's 'egalitarianism' In our analysis economic radicalism is defined as an expression of radical opinions about economic doctrines indicating distrust in the existing economic system This is measured by an index of 10 statements mentioned below Score one in the brackets indicates the presence of economic radicalism in the respondent and score zero means absence of it (i) Government should take over all industries (Agree=1, Disagree=0), (ii) Poverty is the result of unjust distribution of wealth (Agree=1 Disagree=0) (iii) Government ought to guarantee a living to those who cannot get work (Agree=1 Disagree=0), (iv) Government should not put a ceiling on profits (Agree=0, Disagree 1) (v) Great fortunes are mostly made by honesty (Agree=0 Disagree=1) (vi) People would not do their best if government owned all industries (Agree=0 Disagree=1), (vii) If our economic system were just there would have been much less crime (Agree=1 Disagree=0) (viii) Every person should be allowed to keep as much wealth as he can accumulate (Agree=0, Disagree=1) (ix) When a rich man dies his property should go to the government (Agree=1 Disagree=0), (x) Private ownership of property is necessary for the economic progress (Agree=0 Disagree=1)

Class Militancy

This component in our conceptual analysis of class consciousness subsumes political militancy of Lazarsfeld's formulation and militancy of Legett's scheme The dimension of class militancy reflects the sensitivity of the respondent to oppression It measures whether the worker realises that the working class politics is the effective means to establish egalitarian rule The statements used are listed below The interpreting numeric codes are shown in the brackets, zero indicates absence of the feeling of class-militancy in the respondent and one shows its presence (i) Temporary dictatorship of working class is necessary, if any satisfactory progress is to be achieved (Agree=1, Disagree=0), (ii) Workers should not join any agitation which harms the employer (Agree=0, Disagree=1), (iii) Gherao should not be used as a method of protest by workers (Agree=0, Disagree=1), (iv) In capitalist society genuine social progress is impossible without revolution (Agree=1, Disagree=0), (v) At the time of any industrial conflict no one should pay any attention to the view-point of the employers (Agree=1, Disagree=0), (vi) Workers should tolerate whatever predicament they face in their organisation because there is no point in fighting against the management (Agree=0, Disagree=1)

Each of the three dimensions discussed above, namely, class-solidarity, economic radicalism and class militancy measure respectively (a) whether the respondents are aware of their class-position (b) whether they subscribe to the ideology of economic egalitarianism and (c) whether they believe in political militancy The numeric codes representing the responses to all the 22 statements measuring all the three dimensions are then added up to constitute an overall index of class-consciousness The total score then was divided into two categories, point zero to 11 indicating low degree of class consciousness among the respondents and point 12 to 22 indicating high degree of consciousness

Trade Union Situation of Vadodara

The trade union movement of Vadodara, ever since its inception has been dominated by the local affiliates of the national federations At present the following six national federations have their affiliates in

the city: (i) All India Trade Union Congress (AITUC), (ii) Bharatiya Mazdoor Sangh, (BMS) (iii) Centre of Indian Trade Unions (CITU) (iv) Hind Mazdoor Sabha (HMS) (v) Indian National Trade Union Congress (INTUC) and (vi) National Labour Organisation (NLO) which is also known as Majoor Mahajan (Mahajan).

At the time of data collection in 1983 these six federations had organised a total of 64 trade unions consisting of 63,424 workers, i e, about 63 per cent of the organisable workforce of Vadodara. Most of these were small and plant-unions. A few of them were loosely structured general unions often characterised by the lack of a common and unifying bond among their members. Strong industrial or craft-unions were almost non-existent. It is, therefore, not surprising that many of these federations are chronically plagued by a paucity of funds and personnel.

Since most of the workers are mainly guided by their own personal, immediate and expedient considerations the competing federations are successful in attracting workers mainly by raising mundane 'dal-roti' (bread and butter) issues, not by abstract, ideological promises. However, success in winning monetary and real benefits also does not always guarantee that the workers will remain loyal to their unions, or even regularly pay the nominal membership-fee which is often only one rupee per month.

In spite of this, over a period, most of these federations have emerged as viable organisations as indicated by the fact that they have been able to accumulate some permanent assets, of course in varying degrees, such as: office-premises, vehicles, other equipment, office-staff and, above all, veteran full-time/part-time leaders.

Trade Union Leadership

Trade union leadership in India consists of two main tiers, namely, the 'outsiders' and the 'insiders'.[21] The 'outsiders' are the professional trade union leaders and are not employed in any plant; whereas the 'insiders' are worker-leaders or activists who are employed in a plant and who assume the leadership-role to represent their co-workers' problems both to the management and to the union.

In Vadodara too all the six federations have both the tiers of leadership: the full-time, professional leaders, the so-called 'outsiders'; and the worker-leaders or the activists, the so-called 'insiders'. Between the two, the latter is of critical significance for our study, since they not only constitute the backbone of any trade union but also are likely to be more radicalised or class-conscious as compared to the ordinary rank-and-file workers, whose involvement in the trade union activities is generally nominal. If the trade union, as imagined by Marx, is the school of solidarity and socialism, that is, class-consciousness and, if its economic movement is likely to have inevitable political repercussions on its participants then it can be expected that those who participate in it more actively may be influenced by it to a greater extent.

However, one of the heuristic problems is whom to consider an activist. Because, some workers assume active role in trade union activities but they remain, by and large, informal leaders. Whereas, some of these activists assume formal leadership positions in their unions. For the sake of objectivity and also for the sake of practical convenience we decided to study only those activists who take up formal inside leadership roles in their unions.

But, all these formal worker-leaders also do not constitute a homogeneous stratum. Instead, there is a gradation of these activists. Some activists are more in the forefront of union activities than others. For example, those activists who hold any office or position in the executive committee of the union, such as president, secretary, joint secretary, treasurer, etc, are generally more prominent than those who are ordinary members of the executive committee without holding any such position. Our data indicate that the former are not only more prominent but also participate more actively in various trade union activities, including agitations, and perform a more important role of liaison between their union and the management. Therefore, it will be of interest to determine whether there is any distinction in ideological socialisation between those activists who are in the forefront and those activists who play a less prominent role in a trade union. We assume that: The prominent activists, who participate more actively and intimately in the trade union activities, are more likely to be class-conscious than the non-prominent activists, who relatively less actively and less intimately participate in the trade union activities.

Working-Class Ideology of Trade Unions

As we noted earlier, though Marx considered trade unions as the schools of class-consciousness and assumed that the economic movement of a trade union has inevitable radicalising political repercussions, whether intended or not, he also emphasised the role of radical intellectuals and radical political party in accelerating the revolutionary process.

However, in reality we find that all trade unions do not espouse to a radical political ideology or party, though many of them have long-term as well as short-term goals. The short-term goals are common to all of them, which refer to the solution of immediate and day-to-day problems of workers regarding their wage-and-work-conditions. All the unions have to concentrate mainly on the short-term objectives since the workers are mostly interested in their immediate problems. This is true as well for the unions organised by all the six federations of Vadodara. However, in spite of the common pursuit of short-term goals it is the long-term goals, which legitimise the independent and separate existence of these federations. The long-term goals differ from federation to federation and are reflected in their political allegiance as well as working-class ideology.

Each federation has its own ideology regarding the future of the working-class in the system of stratification. Some federations

subscribe to the radical ideology aiming at the abolition of the capitalist system through class-struggles while some others aim at economic and political reforms within the capitalist framework.

The AITUC has allegiance to Communist Party of India (CPI), the CITU is associated with Communist Party of India-Marxist (CPI-M) and the HMS is devoted to the socialist ideology. All the three federations believe in the Marxian principle of class-conflict. Although they differ from one another in their interpretation of the Marxian principle, their main goal is to radically change the present system in favour of the working-class. Therefore, we can classify them as radical federations.

From the remaining three federations, the BMS is associated with Bharatiya Janata Party, the INTUC owes its allegiance to Congress(I) Party and the NLO (Mahajan) is loyal to the Gandhian ideology. All the three are opposed to the Marxian principle of class-conflict and believe in the principle of class harmony. Their main goal is not revolution but they want reform in the existing system for the betterment of the working-class. Therefore, we can categorise these three federations as reformist federations.

Each federation aims to spread its political ideology among its ranks and also to create an ideologically committed following. Thus, it can be assumed that the radical federations (AITUC, CITU and HMS) would attempt to spread their radical ideology by making their followers class-conscious. Whereas, the reformist federations (BMS, INTUC and NLO) would try to inculcate the values of class-harmony among their ranks.

Some studies of the Indian trade-unions have shown that the political ideology of the unions percolates to the workers and that those who internalise these ideologies also become more committed to their trade unions.[24] In this context also the stratum of the working-class activists assumes critical significance. Because, they have to closely interact with the ideologically committed outside leaders of their respective federations whose main goal is to spread their ideology among the workers. Therefore, these activists are more likely to be influenced by their respective federations' ideology as compared to the rank-and-file workers. They are adjacent to the stratum of outside full-timers who are above their own stratum in the influence-structure. As Merton has surmised, persons in adjacent strata of the influence structure constitute a link and there is a sequential flow of influence from the stratum immediately above to the stratum immediately below.[25]

This sociological theory of influence-structure, formulated by Merton, is in consonance with the political theory of the neo-Marxist Gramsci who asserted that the radical ideas generated by the intellectual elites from 'above' percolate down below to the masses of workers. Therefore, our second assumption is: Those activists who belong to the radical federations (i e, AITUC, CITU and HMS) are likely to be more class-consciousness than those who belong to the reformist federations (i e, BMS, INTUC, NLO-Mahajan)

Research Population Sample and the Techniques

Our research population consisted of all the 867 executive members, excluding the outsiders, of the 64 trade unions affiliated to the six federations of Vadodara. We decided to select approximately half of this population for our study, having fairly adequate representation from all the federations with the help of stratified cluster sampling. Table 1 gives federationwise breakdown of the population and the sample in terms of the categories of prominents (i e, officeholders) and non-prominents (i e, non-officeholders). Out of the total 422 respondents, 110 were prominents and 312 were the non-prominents. Interview schedule was used to collect data.

II
Findings

In this section first we attempt to examine whether the level of activism as reflected in the differing prominence of the activists makes any variation in the degree of their class-consciousness. Secondly, we attempt to trace whether the radical or the reformist trade union ideology accounts for variation in class-consciousness of these activists. Next, we also examine which out of these two variables, i e (a) variation in activism as reflected in the prominent or non-prominent rank of the respondents and (b) the radical or reformist ideology of their federation has a stronger relationship with class-consciousness. Finally, in order to test whether the relationship of these two variables with the variation in class-consciousness is independent of any other variable, linear stepwise multiple regression is used.

The findings reported in Table 2 show that 54 per cent prominents *vis-a-vis* 41 per cent non-prominents have high class-consciousness, as indicated by our 22-point index. The difference between the two is statistically significant at $P < .02$ level as shown by the chi-square.

Results of the two-tail t-test given in Table 3 confirm these findings with greater strength showing the significance of the difference at $P < .005$ level.

Thus, we conclude that the prominents who participate very actively in their trade unions are more class-conscious than the non-prominents.

Ideological Affiliation of Activists

Our next task is to see whether the ideology of a federation makes any difference to the class-consciousness of the activists or not. Therefore, we classified the respondents into the radicals and the reformists. We classified

Table 8: Classification of Radical and Reformist Activists according to the Background Variables

Notes: NS = Not significant at <.05 level
Only those responses which indicated high degree on each of the variables are tabulated.

the respondents of AITUC, CITU and HMS as radicals and those of BMS, INTUC and NLO (Mahajan) as reformists In our sample we had 230 activists affiliated to the radical federations and 192 activists belonging to the reformist ones

Our assumption is that the ideology of the federation influences the activists, that is, the radical federations are likely to produce higher degree of class-consciousness than the reformists Table 4 confirms the assumption

As Table 4 shows, 53 5 per cent radical respondents display high degree of class-consciousness as compared to just 34 per cent reformists The difference between the two is statistically significant at P < 001 level as indicated by chi square The mean difference test confirms the difference between the radicals and the reformists on class-consciousness with greater strength i e, at P < 0005 level The results of this test are given in Table 5

Thus in the case of ideological affiliation we find statistically stronger relationship with class-consciousness as compared to the relationship between the prominence and class consciousness

Therefore we decided to control the prominence of the respondents and see whether the association between the ideology of the federation and the class consciousness holds true even after controlling the prominence

Table 6 indicates that the larger percentage of the radical prominents (64 per cent) show higher degree of class consciousness as compared to the reformist prominents (37 per cent) Similarly larger proportion of radical non prominents (49 per cent) show higher class consciousness as compared to the reformist non prominents (34 per cent) The difference between the radicals and the reformists in each stratum (i e prominents and the non prominents) is statistically significant at P < 01 level

The results of the t test given in Table 7 also confirm the difference between radical prominents and the reformist prominents at P < 005 level and between radical non-prominents and the reformist non prominents at P < 0005 level

Whereas when we controlled the ideology and examined the difference between the prominence of the activists and the degree of their class-consciousness it turned out to be slightly weaker For example the mean difference between the class-consciousness of office-holding activists and the non-office holding activists of the radical federations was significant at < 05 level (z = 1 8542) and the mean-difference between the class consciousness of these two categories of the activists of the reformist federations was significant at < 05 level (z = 1 6954)

Thus it can be concluded that though both the prominence and the ideological affiliation are associated with the degree of class-consciousness of the activists, the ideological affiliation is relatively strongly associated with the degree of their class-consciousness as compared to the prominent or non-prominent rank of these activists

Relationship Spurious or Reliable?

However, in this context again a question may arise why do the larger number radical activists (64 per cent) display relatively higher degree of class-consciousness than the reformists (37 per cent)? And why are the prominents (54 per cent) relatively more class conscious than the non-prominents (41 per cent)? Is it because they are socialised in a particular way and therefore they develop more class-related consciousness? Or is it because of some inherent differences in their background they differ in their class consciousness? In other words, it is quite likely that class consciousness may have been associated with other coefficients and that its relationship with the ideological affiliation and the prominence of a respondent may be just spurious We therefore decided to relate the relevant variables regarding the socio economic background trade union participation and attitudinal/behavioural orientations of these activists with their class consciousness in conjunction with (a) their ideological affiliation and (b) their prominence

Other Variables and Class Consciousness

As we saw, the study indicates that the radicals in general display higher degree of class-consciousness than the reformists In order to verify whether this relationship is due to some intervening variables or is independent of them we first examine the radical and the reformist activists in terms of their (i) socio-economic background (ii) trade union participation and (iii) attitudinal/behavioural orientations Then we relate these variables to their class-consciousness in conjunction with their ideological affiliation

Table 8 gives a comparative summary of the selected socio economic background factors of the radicals and reformists and shows that there is a significant difference only in the per capita monthly income and perceived sufficiency of income of the radicals and the reformists Relatively larger proportion of the reformists have high per capita monthly income and also have high perceived sufficiency of income

Table 9 indicates a significant difference between the two on agitational participation (chi square 8 907 P < 005 Z = 5 0698,

Notes NS = Not significant at < 05 level

Only those responses showing high degree are tabulated

P < .0005) though they do not differ significantly in their trade union participation.[26] In other words, the radical activists participate in agitational activities like strike, dharna, processions, gherao etc, to a greater extent than their reformist counterpart.

Table 10 gives us some idea about their attitudinal and behavioural orientations.[27]

Here again there is a significant difference between the two in terms of general activism and general satisfaction with life. A greater percentage (26 per cent) of the reformists as compared to the radicals (19 per cent) are in the high activism bracket. The difference between the two is indicated by Z value at< .005 level significance. The difference between the two on general satisfaction with life is equally significant as shown by chi square at < .05 level and by t-test much above < .005 level which is nearer to < .0005. Here also the proportion of the radicals (36.5 per cent) is smaller than that of the reformists (47 per cent) reporting high general satisfaction with life.

Thus, by examining Tables 8, 9 and 10 we can conclude that the radicals and the reformists significantly differ on the following criteria: (i) per capita monthly income (ii) perceived sufficiency of income (iii) agitational participation (iv) activism and (v) general satisfaction with life. Except the third criterion i.e. agitational participation the reformists are high on the rest of the four criteria. That is, the reformists have higher per capita income, a larger percentage of them feel that their income is sufficient, they have higher general activism and also have greater satisfaction with life as compared to the radicals. The radicals, on the other hand, have higher agitational participation than the reformists.

What remains to be seen, therefore, is whether these characteristics of the radicals and the reformists are associated with the difference in their class consciousness independent of their radical and the reformist affiliations or not. For this purpose we use the linear stepwise multiple regression by taking ideological affiliation as a dummy variable. This test helps us in obtaining indepedent variables with their respective predictive value. The advantage of this procedure is that it recursively constructs prediction equations beginning with one independent variable which is the best predictor and then adding another independent variable, at a time, to the regression equation so that it provides best prediction in conjunction with the independent variable of the preceding equation. The additional independent variable is selected on the basis of its tolerance value.

Although we found that the radical activists differ from their reformist counterpart only on certain criteria, because of the above referred characteristic of the linear stepwise multiple regression we relate all the interval scale variables taken in the analysis with the dependent variable of class-consciousness. Since 'radical and reformist activist' is not an interval-scale variable we convert it into a dummy variable by assigning score value one to the radicals and zero to the reformists since the former display higher class consciousness than the latter.

The correlation coefficients reveal that the association between X_1 (affiliation of the respondent: radical or reformist), X_2 (age), X_7 (total job experience), X_8 (general satisfaction with life), X_{10} (company satisfaction), X_3 (traditionalism), X_{13} (participation in trade union) and X_{14} (agitational participation), and the dependent variable class consciousness is statistically significant at .05 level or better. However, all the independent variables are not positively associated with class consciousness. For instance, X_2 (age), X_5 (total family members), X_6 (per capita monthly income), X_7 (total job experience), X_8 (general satisfaction with life), X_{10} (company satisfaction) and X_3 (traditionalism) are inversely related with it. The summary of the linear stepwise multiple regression is given in Table 11.

Out of all these independent variables X_{14} (agitational participation) explains highest variance (about 14 per cent, multiple R = .138) in the dependent variable of class-consciousness. With the addition of X_{10} (company satisfaction) and X_9 (general satisfaction with life) respectively 21.1 per cent and 24.5 per cent variance in class-consciousness is explained. It is interesting to note that X_1 (affiliation of respondent: radical/reformist) individually explains only 2 per cent of the variance and in conjunction with other five variables it explains 32 per cent variance in the class-consciousness.

Thus, the variable of agitational participation among all the other independent variables has the strongest association with the dependent variable of class-consciousness. That is, the higher the agitational participation of the respondents the greater the degree of their class-consciousness. Even the relationship between the ideological affiliation and the class-consciousness which was strongly established earlier now turns out to be relatively weak as it explains independently only 2 per cent variation in the class-consciousness of the respondents. This means the stronger relationship found earlier in our analysis between the radical affiliation and the higher degree of class consciousness was also due to the fact that the radical federations as our data reveal tend to agitate more in practice.

Prominence, Other Coefficients and Class Consciousness

A similar exercise is performed with reference to the prominents and the non-prominents. Our data show that the prominents significantly differ from the non-prominents on several of the social-background, trade union participation and attitudinal/behavioural criteria. For instance, the larger number of prominents report that their per capita income is higher than the non-prominents (z=2.5763, P < .05) and that their subjective perception of the sufficiency of their income also reflects the same tendency (z=2.4347, P < .01). Likewise, the prominents are more educated than the non-prominents (z=6.2075, P < .0005). They have greater proficiency in English language than the latter (z=7.0575, P < .0005). The prominents participate more in the trade union activities than the non-prominents (z=7.7208, P < .0005). Their agitational participation is also greater than that of the latter (z=4.5317, P < .0005). They are less traditional than the non-prominents (z=3414, P < .0005) and are also less alienated than the latter (z=2.4362, P < .01).

Table 11: Summary of Linear Stepwise Multiple Regression Analysis Keeping Ideological Affiliation as a Dummy Variable

Dependent Variable: Class Consciousness

Independent Variables in the Stepwise Regression Equations	Direction of Relationship	Multiple R	Multiple R²
X_{14} Agitational participation	+	0.372	0.138
X_{10} Company satisfaction		0.450	0.211
X_9 General satisfaction with life		0.495	0.245
X_3 Traditionalism		0.530	0.281
X_7 Total job experience	–	0.553	0.306
X_1 Ideological affiliation of the respondent (radical or reformist)	+	0.566	0.320
X_{13} Routine participation in trade union	+	0.576	0.332
X_5 Total family members		0.584	0.341
X General activism	+	0.590	0.348
X Per capita monthly income		0.594	0.353
X_4 Proficiency in English	+	0.597	0.356
X_{11} Alienation	+	0.598	0.358
X Age		0.599	0.359
X_3 Education	+	0.599	0.359

Notes: + = Positive, – = Negative

Therefore in order to study the relationship of these variables with the respondents' class consciousness, we use linear stepwise multiple regression to see the association of all the interval scale variables in conjunction with the variable of prominence. For this purpose the variable of prominence is treated as a dummy variable by assigning score value one to the prominent activists and zero to non-prominent activists since the former display higher degree of class consciousness than the latter.

The correlation coefficients further confirm that the seven independent variables reported in the above section (i e X_2, X_4, X_7, X_7, X_8, X_{10} and X_1) are inversely related with the dependent variable of class-consciousness and that except X_1 (Rank of respondent prominents or non prominents) the association between all the other variables mentioned in the above section (i e X, X_7, X_8, X_{10}, X_1, X_{11} and X_{14}) and class consciousness is significant at .05 level or better.

However the summary of the linear stepwise multiple regression given in Table 12 shows that only 34 per cent variance (Multiple R^2 = 0.340) in the class-consciousness is explained as compared to 36 per cent reported in Table 11. This reduction of 2 per cent seems to be due to the exclusion of the variable of the radical reformist activist (which accounted for 2 per cent variance in the overall class consciousness) and the inclusion of the variable of prominent and non prominent activists (which has practically zero contribution to the class consciousness). This further confirms the earlier finding that the relationship between the rank and class consciousness is weaker when we control their ideological affiliations.

Except this the variables with the strongest association with the dependent variable of class consciousness remain by and large, the same. For example, X_{14} (the agitational participation) explains the highest variance (i e about 14 per cent) in the class consciousness followed by X_{10} (the company satisfaction) and X_8 (general satisfaction with life).

III
Concluding Remarks

At the outset we assumed that if trade union as postulated by Marx is a school of class-consciousness then (i) the prominent activists who participate more actively in the trade union activities are likely to have higher degree of class consciousness than the non prominents and (ii) that the activists affiliated with the radical federations are likely to be more class conscious than those affiliated with the reformist federations. The data support both these assumptions. But, between the ideological affiliation and the prominence, the former has relatively stronger association with the class-consciousness of the activists. However, further analysis of the data indicates that the participation in struggles and agitations, for basically economic or other related immediate objectives is most significantly associated with class-consciousness of the activists than any other variable. That is, the greater the agitational participation of the activists, the greater the probability of having higher degree of class-consciousness by them. In other words more active participation in routine trade union activities does not seem to be significantly related with class consciousness. It may be a necessary condition but not a sufficient one to radicalise the workers.

This brings us to the socialisation aspect of trade unions. Generally the outside trade union leaders spend most of their time in routine trade union activities. Therefore they do not have much time to conduct study circles or to formally educate the workers in the ideology of their respective federations.[9] But the struggles and the agitations which they lead against employers seem to have a radicalising impact perhaps unintended on their followers. This may be because of the fact that at the times of struggle interest and participation of the workers in the trade union increases. When they agitate they realise that they have common interests which can be realised only through unity. They also learn that their interests conflict with those of their employers and that they can enhance their class interests only at the cost of their opponents interests. Moreover during the struggle they develop greater empathy for the problems of the working class in general and antipathy for the class of employers. Thus it can be concluded that the trade unions prove to be a school of class consciousness provided that they engage in agitations. As our data suggest the stronger relationship between the affiliation with the radical federations and the higher degree of class-consciousness of the activists is due to the fact that these federations not only espoused the radical ideology which explicity supports an agitational approach but also in practice they agitate more often.

As a corollary, it can be inferred that if the reformist federations are compelled to adopt agitational approach more frequently, either because of the failure of the adjudication process or for any other reason, then probably they may also generate greater class-consciousness among their members much against their professed intentions or manifest ideology.

Conversely, if the radical trade unions become less agitational, either due to increasing dependence on adjudication machinery or for any other reason then probably they may fail to generate radical consciousness among their followers defeating thereby their ideological objective.

In this connection, however a methodological caveat regarding the index of class-consciousness is in order. Since the research in this area is limited and lacks cumulativeness a commonly accepted and standardised research tool is so far not available to measure class consciousness of workers, especially in the Indian context. Therefore, we decided to construct an index for this purpose. Although an index may not be considered as powerful a research tool as the scaling technique is it is accepted and widely used as a classificatory device and as a tentative step towards quantitative measurement of socio psychological data.[10] Of course we tried to make this index reasonably comprehensive by including 22 items encompassing the three important dimensions of class consciousness dervied from the available literature namely (a) class solidarity (b) economic radicalism and (c) class militancy.

Table 12: Summary of Linear Stepwise Multiple Regression Analysis Keeping Prominence of the Respondent as a Dummy Variable

Dependent Variable: Overall Class Consciousness

Independent Variables in the Stepwise Regression Equations	Direction of Relationship	Multiple R	Multiple R^2
X_{14} Agitational participation	+	0.372	0.138
X_{10} Company satisfaction		0.459	0.211
X_8 General satisfaction with life	–	0.495	0.245
X Traditionalism		0.530	0.281
X_7 Total job experience		0.553	0.306
X_4 Total family members	–	0.563	0.317
X General activism	+	0.569	0.324
X Per capita income		0.574	0.329
X Proficiency in English		0.579	0.335
X Participation in trade union	+	0.582	0.339
X Age		0.582	0.339
X Education	+	0.583	0.340
X_1 Alienation	+	0.583	0.340
X Rank of respondent prominent or non prominent	+	0.583	0.340

Note + = Positive – = Negative

Besides, our data confirm its validity through the indirect criterion method. The criteria groups are the radicals and the reformists And, as theoretically assumed, the data analysis shows that the radicals display relatively higher degree of class consciousness as compared to the reformists Thus, the index constructed by us is a valid measure of the concept of class-consciousness

Moreover, the correlation coefficients of the class-consciousness also show that except one item ("temporary dictatorship is necessary, if any satisfactory progress is to be achieved") the other 21 items are related with the total score at < 05 level of significance Nevertheless, the index can be further improved with the help of more rigorous procedures such as factor analysis and test-retest method

Notes

[This is a revised version of a paper presented at a seminar on 'Urban Poor in India' held at Centre for Social Studies Surat February 10-11, 1993 I am indebted to N R Sheth Robert Merton Peter Blau and Bernard Barber for their exceedingly valuable comments on the earlier draft My thanks are due to H M Rajyaguru and Sri Hari for their helpful suggestions regarding the statistical analysis I am also grateful to Ranu Vanikar for editorial improvements However the final responsibility of the views expressed and errors that might have crept in is mine]

DISCUSSION

Final GATT Agreement

An Assessment

V M Tarkunde

THIS article is being written after a good deal of hesitation. I have gone through the controversial provisions of the Dunkel Draft. I have also seen a good deal of the literature on the subject including an instructive article by S P Shukla who was formerly finance secretary of the govern ment of India and was also India's ambassador and permanent representative to GATT at Geneva. Not being a professional economist nor a person well versed in international commerce I can do no more than present my tentative views on the controversy generated by India's representative signing the Final Act of GATT's Uruguay Round. Nevertheless I think it necessary to do so because many of the published articles on the Dunkel Proposals (*not* the one by S P Shukla) were felt by me to be highly one sided and also because some leftist political parties have decided to start a mass movement to condemn India's signing the Final Treaty. I believe that such a movement will be highly detrimental to India's interests and also to the cause of the leftist parties themselves. I hope that the publication of these tentative views will evoke a thoughtful response from persons more qualified to contribute to this discussion.

It is a matter of regret that many of the leftists in India have apparently developed a phobia against the US. The phobia seems to have originated in the tussle for supremacy between the US and the former USSR which commenced at the end of the second world war. For the Indian leftists the USSR represented the progressive left and the US the reactionary right. After the self liquidation of the USSR the leftists' fear of American domination appears to have increased because the US is the only world power left in the field. It is being overlooked that although the US is undoubtedly the most powerful military nation in the world today it is no longer the supreme economic power. Its economic supremacy is challenged by the EU as well as by Germany and Japan. Moreover, despite its powerful lobbies of vested interests the US is a staunch democracy which harbours a number of vocal progressive elements. It is wrong to assume that everything which emerges from the US is necessarily antithetical to the interests of developing countries like India.

It is even more erroneous to assume that every proposal of an international body in which America plays an important role is aimed at promoting western vested interests and is likely to be detrimental to the interests of developing countries. When in the beginning of 1992, some conditionalities were proposed by the IMF and the World Bank in granting a substantial loan to India to meet a critical balance of payments crisis the government of India declared an economic policy which was largely in conformity with the conditionalities proposed by the international lending agencies. A hue and cry was raised by many of the Indian leftists on that occasion and the economic policy was condemned as being anti Indian. The monthly *Radical Humanist* pointed out at the time (in an editorial 'Let Us Remove Our Blinkers' published in the March 1992 issue) that it was wrong to assume that the IMF and the World Bank have some animus against India. It was argued in the article that India's economic policy, though limited in scope could be defended as being in India's interest. Although it is still doubtful whether the economic policy declared by the government at the beginning of 1992 will or will not succeed it is now clear that the apprehension about the IMF and the World Bank having some reason to impose conditionalities detrimental to the interests of India was entirely justified. Subsequent events have made it clear that the IMF and the World Bank are not reactionary bodies. It is now well known that while advancing a substantial loan for the Sardar Sarovar Project on the Narmada river the World Bank had imposed conditions for the rehabilitation of tribal oustees which were exceptionally generous. A recent report says that the World Bank has now proposed the grant of a loan of 70 billion dollars to India for the purpose of programmes for poverty alleviation including the provision of health care to the rural poor. It appears that the prejudice which the Indian leftists had for organisations like the IMF and the World Bank has now subsided to a large extent.

In the case of GATT also, a similar change of attitude on the part of Indian leftists is likely to take place. GATT (General Agreement on Tariff and Trade) was formed in the year 1948 and India was one of the countries which were parties to that agreement from the beginning. There are at present 110 countries, the majority of whom are underdeveloped or developing, which are parties to GATT. It is in the interest of developing countries like India to have more trade with other countries. Indira Gandhi, when she was the prime minister of India, was once reported to have said to the developed world "Give us trade rather than aid". What she said made good sense. International trade is helpful to all the parties involved, and developing countries are naturally in greater need of such help which harms none and benefits all.

Including the General Negotiations of 1947 48 there had been seven Rounds of Negotiations of GATT countries till the year 1979. These negotiations were aimed at reducing tariff and non-tariff barriers to the exchange of goods in the course of international trade. The decisions reached in these seven rounds do not appear to have resulted in any serious controversy. The eighth and last round called the Uruguay Round commenced in 1986 and after protracted negotiations, the Final Act of this round was signed by the GATT countries on April 15 1994. The Dunkel Proposals which were made towards the end of this round and which resulted in the Final Act proved to be highly controversial and the controversies have continued even after the signing of the Final Act.

The controversies arose because a number of new items were introduced for the first time in the agenda of the Uruguay Round. The new items were (i) Agriculture (ii) Trade in services (iii) Protection of intellectual property rights (particularly object patents in plants and medicines) and (iv) Deregulation of controls of foreign investments. Out of these, the theme relating to trade in services did not prove to be contentious. That was because as pointed out by S P Shukla in the article mentioned above the US which was the main protagonist of the theme relating to trade in services found itself on the defensive in certain service areas. There was a strong opinion in the US and Japan that financial services should be removed from the GATT agenda. The proposals under this theme were accordingly moderated and the developing world was able to retain an adequate degree of autonomy in the area of services. The other theme regarding the deregulation of controls over foreign investments did not also lead to much dispute because the developing countries were themselves keen to welcome foreign investments and had no reason to impose unacceptable controls over them. Thus only two of the newly introduced themes remained controversial—agriculture and the protection of intellectual property rights

There were of course some other controversial topics which were not related to the new themes introduced in the Uruguay Round. One of them was the Multi-Fibre Arrangement (MFA) which was arrived at between certain developed countries including the US and which enabled them to depart from the basic rule of GATT that there should be no discriminatory restrictions on international trade. Under the MFA developed countries could impose discriminatory restrictions on imports of textiles and clothing from developing countries whose products were cheaper because of lower wages and efficient production. The demand of developing countries, including India, which were interested in the export of textiles and clothing, was that these unjust restrictions should be removed.

It is natural that in trade negotiations between as many as 110 countries the resulting decisions would contain a good deal of give and take. In judging the final result of the Uruguay Round from India's point of view we have to weigh what we are likely to lose against what we are likely to gain. A cognate question is whether it is more advantageous to India to remain within the GATT umbrella after taking into consideration all the advantages or disadvantages or whether it is more in India's interest to opt out of the GATT altogether and rely only on such bilateral trade agreements as we can enter into with individual countries.

Let us first consider the gains made by India as a result of the Uruguay Round. In the first place, it has been now agreed that the Multi Fibre Agreement which enabled the US and some other countries to impose discriminatory restrictions on the import of textiles and clothing from India and other developing countries will be phased out in the course of the next 10 years. Ten years is perhaps too long a period for the phasing out of the MFA but that time can be utilised by us in improving the quality of our cloth and garments. Textiles of various kinds are the largest single item in our exports. The textile industry also remains the largest single industry accounting for 20 per cent of the total industrial output in India. It is moreover a labour-intensive industry. While the production of yarn takes place in the organised sector more than three fourths of the cloth produced is through powerlooms and handlooms. The phasing out of the MFA in the course of 10 years would be of substantial advantage to India.

The fate of Indian agriculture under the provisions of the Final Act of the Uruguay Round remains highly controversial. While an intelligent and experienced leader of Indian agriculturists like Sharad Joshi does not find anything detrimental to the prospects of Indian agriculture in the final Uruguay decisions, the same decisions are looked upon by some other agriculturist leaders as ruinous to Indian cultivators. I am inclined to take a middle position in this controversy but my position is more towards that of Sharad Joshi than that of the other agriculturist leaders. While some decisions of the Uruguay Round are highly beneficial to Indian agriculturists the other decisions are not as harmful as they appear to be and they can even be turned to our advantage by well conceived developmental activities.

One of the decisions taken in the Uruguay Round in the region of agriculture was in regard to the subsidies which a country may give to its agriculturists. Obviously a substantial amount of subsidy given to agriculturists enables them to sell their products more cheaply both inside the country and abroad. It is therefore necessary for non-discriminatory international trade to do away with agricultural subsidies. Now the subsidies given by the developed countries to their own agriculturists are on the whole far more generous than the subsidies which India has been able to extend to its own agriculturists. It was decided in the Uruguay Round that (leaving aside minor refinements) developing countries including India would be allowed

to subsidise their agriculturists to the extent of 10 per cent of the value of the total agricultural production, whereas developed countries were allowed to subsidise their own agriculturists to the extent of only 5 per cent. Now the subsidies given by developed countries to their farmers are much above 5 per cent of the value of their total agricultural produce while the subsidies given by India to its own farmers are much less than 10 per cent. All the subsidies given by India to its farmers, consisting of subsidised supply of fertilisers, antiseptics and water and electricity work out at less than 6 per cent of the total agricultural produce. (By the way the lower prices charged to ration card holders in our Public Distribution System is a subsidy to consumers and not to agriculturists.) Thus we have no reason to reduce the subsidies given to our farmers for the sake of complying with the Uruguay decisions. The reduction of subsidies given by developed countries to their farmers would however result in raising the price level of agricultural products in the international market. That will obviously be helpful in promoting our agricultural exports to the advantage of India's farmers. It is likely that the advantage will be substantial.

An Uruguay decision which is likely to be harmful to Indian farmers consists of the grant of patents to plant varieties. Such patents are in the nature of what is called object patents. They protect the exclusive right of the patentee to make, use and sell the patented object. Object patents given to plant varieties will extend, it appears, to the seeds of the plants. Apart from the object patents granted for plant varieties, process patents can also be granted to micro organisms and non biological and micro biological processes. Since plant varieties are likely to be produced by the use of micro biological processes, a patent granted for a plant variety will also extend to the process by which that variety is produced. A patent once granted will last for 20 years. When an object patent is granted the same object cannot be prepared by adopting some other process without purchasing a licence from the patentee. Also without such a licence the patented object cannot be used for research for producing improved products.

Much emphasis is placed by the government of India on a provision in the Dunkel Draft which says that the protection to a plant variety may be given either by patents (for which purpose the Indian Patents Act, 1970 will have to be amended) or by an effective *sui generis* system. What shape a *sui generis* system may take is not clear. Since such a system has to be 'effective' in protecting the patent, it does not appear that this facility will go far in moderating the effect of patents granted for plant varieties.

However, the provision of object patents for plant varieties is not so detrimental to the interests of Indian farmers as it appears on the surface. Firstly, the cost of seed is a very minor part of the total cost of production of agricultural goods. Even if the cost of the seed increases by, say, 40 or 50 times, it will still be a small percentage of the total cost of production. Secondly an agriculturist will purchase the costly seed only if he finds it more profitable in the result than the non-patented seeds available to him. It is possible that patented seeds may have to be purchased or imported every year but even that may be distinctly profitable to the farmer. Indeed the patentee will also have to limit the price of the patented seed to the capacity of the market. Even today progressive farmers from south India import hybrid tomato seeds in a big way year by year and find them highly profitable (*Dunkel Proposals* by K N Chowdhry and J C Aggarwal, p 131). Thirdly the patentee can be required by law to grant a licence, and that too at a reasonable price, to one who wants to prepare the same object or to adopt the process which is patented or to use the patented object for further research and this right can be enforced by a judicial authority. The Final Act of the Uruguay Round specifically provides that judicial remedies both to the patentee and persons who want to acquire a licence for the use of the patent will be available from the judiciary of the country where the patent is operative. Thus in India the protection to the patentee and to the intending purchaser of a licence will be made available by Indian courts and in accordance with the amended Indian law. Lastly we need not assume that object patents and process patents in regard to the plant varieties will be owned only by individuals or corporations of foreign countries. India is one of the richest countries in plant varieties and Indians are not lacking either in intelligence or in inventiveness. A period of 10 years has been provided in the Final Uruguay Act for the introduction of the patent regime, and during that period we can develop research facilities which may enable Indians to acquire patent rights in plant varieties that may be very useful in India as well as abroad.

Another provision of the Uruguay Final Act which is potentially harmful to India is the one relating to patents for medicinal preparations. Here also the patents will be for products as well as processes. They also will be for 20 years. The patent regime will have to be established before the expiry of a period to 10 years from the signing of the Dunkel Draft. It is true that some of the medicines used in India will become much more costly when the new patent regime is established. The government of India says that only 10 to 15 per cent of the medicines will thus increase in price, while the opponents of the Dunkel Draft say that about 40 per cent of the medicines will become more costly. The two parties also differ in regard to the extent to which the prices of patented medicines are expected to rise. It appears to me that both the percentage of the medicines affected and the extent of the rise in their prices will be greater than what is claimed on behalf of the government of India. But here also we have some advantages which should not be ignored. We have in India a rich variety of medicinal plants of ancient fame as well as a large number of effective ayurvedic medicines. Research in these and other Indian varieties of medicines should now be intensified. Some of the ayurvedic as well as homeopathic medicines are found to be more effective than the allopathic ones. In this sphere also both the prices of patented medicines as well as the charges for securing licences from the patentees for manufacture or research will be subject to the judicial process of Indian courts. It is specifically provided in the Dunkel Draft that the use of patented medicines without the authority of the patentee will be permitted if prior to such use the proposed user has made efforts to obtain authorisation from the right holder on reasonable commercial terms and conditions and that such efforts have not been successful within a reasonable period of time. It is also provided that unauthorised use may be allowed in a national emergency or circumstances of extreme urgency or in cases of public non commercial use. It thus appears that public hospitals in which entirely free medicines are provided to the poor will be entitled to use patented medicines without the authority of the patentees.

S P Shukla in the article mentioned above has observed that if the national interest requires us to opt out of the Uruguay Round decisions we should face the isolation 'with courage and conviction'. I do not think, in the first place, that it is necessary for us for reasons stated above to opt out of the Uruguay decisions. Secondly, I believe that more courage and conviction is required from us in India to remain within the comity of nations and to fight our way out of the difficulties created by patents in plant varieties and medicinal preparations, than to opt out of the Final Uruguay Act. It appears to me that much of what is written against the Dunkel Draft is the result of a defeatist attitude. We should have more confidence in the intelligence as well as the courage of Indian scientists, entrepreneurs and consumers.

The Rising Sun

Japan's response to the new international economic and political situation and its emerging international role can be understood only in the light of the changes which have taken place in its domestic political economy and its industrial policy regime in the post-war decades 2418

Black and Female

Toni Morrison's novels explore a world of interlocking systems of race, class and sex oppression which denigrates the coloured as inferior and locates the female in the periphery 2439

A Farce

The Andhra government's hasty move to include all kapus and all Muslims in the list of backward classes thereby side lining the backward classes commission has reduced the system of reservation to a farce 2397

Defining Liberalism

Is India a liberal economy? To be so would mean that India has to move strictly in accord with the direction laid down in the Constitution, in the Directive Principles of State Policy in the matter of equality before law of all citizens of this country and in matters such as the right to information 2393

Dos, Don'ts and Musts

An understanding of the traditional beliefs about a pregnant woman's prescribed food helps in the formulation of strategies and programmes for improving maternal nutrition 2427

Internal Transfers

The USAID the main conduit of American development aid to the third world is pumping in millions of dollars into the country's family planning work which is being programmed to use contraceptives produced by MNCs, aiding the US industry 2401

'Foreign' Presence

The presence of migrants, whether they be labourers or entrepreneurs must be considered an important factor in analysing social tensions in a society including the recent communal violence 2408

Resplendent Tiger?

The inevitable corollary of accumulation wedded to liberalisation privatisation and accelerated integration into the world market is the frenzied drive to capital concentration in Malaysia 2403

To Market

The eagerness of nationalised banks to go to the market to raise capital throws up some awkward questions 2402

'Socialist' Regime?

Spokespersons of the ex-Soviet Union used to claim that a change in the juridical form of ownership in the means of production meant a change in the capitalist relation of production itself This is nothing short of standing Marx on his head 2444

Unfreedom

Three newspapers have been banned in Indonesia for allegedly disrupting 'national stability' by asking uncomfortable questions on the government's recent defence deals 2407

Crack-Down on Kashmiri Activists

IT is a mark of our indifference towards Kashmir that not only does a week-long crack-down on Kashmiri activists go unreported but it also evokes little response among those who know. It is as though infringement of rights and arbitrary rule are of no concern.

In raids conducted by the security forces in Srinagar in the past one week, several prominent citizens including engineers, doctors, professors and journalists have been arrested. They were said to be the ideologues of the Jamaat-e-Islami in Jammu and Kashmir which demands right of self-determination for the people of Kashmir. As part of this crack-down troops confiscated on September 7 computers and other equipment used by the Institute of Kashmir Studies to document atrocities committed by Indian security forces.

Amidst the violence that Kashmiri society has been subjected to, such raids and arrests may not seem extraordinary. But we believe that in attempting to suppress voices which have documented and disseminated violations of democratic rights by Indian troops there is a danger of an escalation of the Indian military crack-down.

We would like to point out that the Institute of Kashmir Studies by recording all cases of atrocities was filling a gap in our information about the goings-on in Jammu and Kashmir. By confiscating its equipment and records, the government of India is setting a new precedent of denying Indian public the right to know the nature of the crimes being committed in its name by agencies of the government.

HRD Expenditure

IN his letter (July 23) A K Sarkar wonders how I had worked out (June 11) an estimate of 15 per cent as the real increase in HRD expenditure in the first three years of the economic reforms. First of all, however, I would like to stress the fact that even a smaller increase, against the background of rapidly declining total expenditure (18.4 per cent between 1990-91 and 1993-94 [budgeted], means a relative increase and therefore an improvement (however small) in priority setting.

Next I will explain the 15 per cent. If I want to combine the performances of the three years mentioned, of course, I have to compare with the year before the first one, which is 1990-91. That gives an increase of 15 per cent. The 9 per cent increase Sarkar mentions takes the first Manmohan year as the base year. That wrongly excludes the performance of the first budget. I agree that the last (pre-Manmohan) year was quite bad for HRD expenditure (also relatively, as a proportion of total expenditure, namely, only 6.36 per cent). That is why I also make a comparison with an earlier year (1989-90), which gives a real increase of 6 per cent. This seems a small increase, but this still means a relative increase of not less than 29 per cent (from 6.96 to 8.97 per cent).

It is surprising how Sarkar and I come to completely different conclusions based on the same quantitative data. Still I do not see how Sarkar can maintain the conclusion that HRD expenditure has been affected during the stabilisation period, given the fact that the average real rate of growth of central HRD expenditure during the first three reform years is 4.8 per cent (i e, 15 per cent in three years), while real total expenditure has fallen by 5.8 per cent per year, on an average, in the same period (i e, 18.4 per cent in three years).

I do agree, however, that the actual figures of five years would give definite conclusions.

August 20

THE *EPW* issue of August 20 this year marks something of an anniversary—the first issue of the *Weekly* was dated August 20, 1966. You, your staff and readers may be interested in knowing that only in three other years after 1966 have your issues carried that date: 1977, 1983, 1988; and you will have to wait another 11 years, that is, until 2005 for another such coincidence. Actually, August 20 falls on a Saturday (the day of issue of the *Weekly*) in a pattern of 6+11+6+5 years repeated every 28 years.

ECONOMIC AND POLITICAL WEEKLY

Behind the Gloss

GOVERNMENT spokesmen have of late been declaring that the economy has definitely turned the corner and that overall growth in 1994-95 would be about 5 5 per cent On the face of it many aspects of the improved economic performance—the large foreign exchange accruals and reductions in current account deficit, the rise in government tax revenues and the improvement of the fiscal balance, the pick up in private sector investment the acceleration of growth of industrial output and the moderation of inflation—are more or less palpable But in their smugness about these developments, the finance minister the fiscal adviser and the finance secretary sweep under the carpet the other fundamental socio-economic problems which remain to be addressed by the government s economic policies

Assuming that the government does manage to produce a growth rate of 5 5 per cent this year the acute problems of poverty unemployment and underemployment and the extremely inadequate social infrastructure of educational and health facilities, let alone the growing inequality in income and wealth, both between classes and regions, will not be ameliorated for that reason In fact the higher growth if it is achieved, will be at the cost of dealing with these basic aspects of underdevelopment High growth of over 5 5 per cent had occurred during the whole of the decade of the 1980s, but these socio-economic problems continued by and large to be acute at the end of the decade The present government has characterised the growth in the 80s as 'borrowed growth', that is, it had been financed by excessive public borrowing from abroad as well as domestically, resulting in unsustainable levels of external and domestic debt But the present pattern of financing of growth is hardly different In the first place, in order that growth is sustainable there should be a rising proportion of saving in gross domestic product This is not happening The 1980s saw virtual stagnation in the domestic savings ratio and, since the beginning of the structural adjustment programme in 1991, there has been in fact a steady decline in the saving rate Of course, it could not have been otherwise, what with free import of gold and silver and the general encouragement of conspicuous consumption, including through provision of bank finance The whole industrial strategy of the government is critically dependent upon middle class consumption For example in the first quarter of 1994-95, passenger car production has jumped by 57 per cent and car sales by 21 per cent, similarly, some Rs 10,000 crore worth of gold, silver and other consumer durables were allowed to be imported or smuggled in 1993-94

The largest part of the additional foreign exchange accruals is attributable to portfolio investment by foreign institutional investors (FIIs) and external commercial borrowings and other finances obtained through India funds and global depository receipts (GDRs) These inflows have now crossed $ 9 billion, that is, over Rs 28,000 crore Even a net 15 per cent cost of these funds would mean an annual foreign exchange outgo of about Rs 4,200 crore, which is certainly in excess of the normal debt servicing cost of equivalent borrowing Also, this cost is in no way different from the cost of the debt contracted in the 80s, the only difference being the hidden nature of the present cost Apart from that the FIIs' investment in share markets has contributed to the generation of a massive amount of unearned income and wealth which would have serious social consequences in the long run The government, mesmerised by the structural adjustment programme, is incapable of appreciating these deleterious consequences for society, just as it is unconcerned about the exorbitant cost to the economy of these external liabilities Above all the experience of many countries, including our own in the 1980s, shows that excessive dependence on foreign borrowings generates complacency in regard to the need to raise the level of domestic savings

Domestic borrowing in the past two years, facilitated by the easy availability of liquidity in the financial system, too has been sizeable If the government now expects the gross fiscal deficit (GFD) in 1994 95 to be only about 6 per cent of GDP, it is partly because of a reduction in expenditure, whereas the government's overall borrowing as a proportion of total expenditure is unlikely to be lower The government has surrendered a significant proportion of current revenues through tax reductions and has opted instead to depend on costly market borrowing Against normal market borrowing of Rs 4 848 crore planned for 1993-94, the government borrowed through dated securities, other medium- and long-term borrowings and 364-day treasury bills a total amount of Rs 49,000 crore Similarly against the normal borrowing target of Rs 4,654 crore for 1994 95, the centre s requirements are now estimated at Rs 36,000 crore Borrowings through dated securities and 364-day treasury bills during April-August 1994 have already aggregated nearly Rs 19,500 crore against Rs 6,000 crore during April-August 1993 Also the government's claim that tax revenues have shown exceptional buoyancy so far this year needs to be accepted with caution until more details are made known There has been, for instance a 284 per cent increase in collections under corporate taxation from Rs 393 crore during April-June 1993 to Rs 1,509 crore during April-June this year but the two figures are not comparable as there were large tax refunds last year Besides, companies have been generating substantial other income' through sale of real estate dealings in the stock markets, etc, which have not emanated from real economic activity and which cannot be sustained in the long run In any case for annual budgeted corporate tax receipts of Rs 12 480 crore receipts of Rs 1,509 crore in the first quarter of the year can hardly be considered satisfactory The collection of Rs 11,092 crore from excise duties and Rs 7,451 crore from customs during April July 1994 may appear substantial, but as the collections in the previous year were unduly low, the increase in coming months will have to be watched before the nature of the final outcome can be determined What is more, the final outcome of the budgetary position will be qualitatively development-friendly only if expenditure on the

social and economic infrastructure is commensurate with the Eighth Plan targets For the present all the indications are that there has been a continuous and sizeable shortfall in such expenditure

True, there has been some moderation in annual inflation to about 9 per cent, just as there has occurred some improvement in the economy's overall growth rate But by far the largest contribution to the improved performance has come from the bumper agricultural crop that is expected after the good south-west monsoon With growth, in value added terms, of about 3 5 per cent in agriculture and 6 per cent in manufacturing and with appropriate growth assumptions for the other sectors, overall GDP may well show a rise of about 4 5 per cent of which about one fourth will come from direct agricultural growth Similarly the inflationary situation had remained stubbornly disquieting until the satisfactory south west monsoon

A crucial issue is whether the private corporate sector on which so much is dependent is expanding its investment activity commensurate with the hype in evidence in the stock and financial markets In this regard, studies based on the capital expenditures of companies which have been sanctioned assistance by the term-lending institutions do not present an encouraging picture It is found that the private corporate sector is expected to achieve a total capital expenditure of Rs 37 551 crore in 1994-95, showing a rise of 15 5 per cent in nominal terms over the capital expenditure in 1993-94 There had been a sharper rise of 20 8 per cent to Rs 32 500 crore last year Considering that project cost increases are not fully reflected in the wholesale price index for capital goods, rise in expenditure in real terms is unlikely to have been more than 5 to 6 per cent in 1993-94 It would not be any higher in 1994-95 too Also, imports of capital goods are rising at a fast rate and hence the rise in corporate sector investment may not be fully reflected in increased domestic production of capital goods

Total domestic investment will also continue to be affected by the arresting of investment expansion in the public sector Macro-economic data suggest that the overall domestic saving rate is unlikely to go beyond 24 5 per cent as against 23 per cent to 24 per cent in the four years from 1990-91 to 1993-94 While in 1993-94 the net inflow of foreign resources was probably a nominal Rs 1,500 crore (0 2 per cent of GDP) there would not be any saving inflow for investment from abroad in 1993-94 Hence, investment as a percentage of GDP in 1994-95 will be no higher than the proportion of domestic saving—roughly about 24 5 per cent, which was the investment ratio in 1993-94, or 2.5 percentage points below the investment ratio four years ago in 1990-91 (27 per cent) The government's contention that the domestic investment rate has picked up does not therefore, hold water

UTTAR PRADESH

No Case for Dismissal

IF the central Congress leadership decides to withdraw support to the SP-BSP government in UP, as recommended by the state Congress committee or dismisses the present government and dissolves the assembly, as urged by the BJP it would only help the combine to consolidate further the mass support it has doubtlessly mobilised in the plains during the current agitation in the Uttarakhand region of the state against the extension of the 27 per cent reservation for the OBCs to this region

Actually the central leadership of the Congress is unlikely to go in for taking these drastic actions The agitation in Uttarakhand has already largely fizzled out leaving no case for the dismissal of the UP government Given the *realpolitik* abilities of the chief minister Mulayam Singh Yadav, amply demonstrated in the recent and distant past, the government may survive the withdrawal of support by the Congress by engineering further walkovers to the Samajwadi Party from the smaller parties in the legislature (The most recent of such walkovers occurred only a few days back when Afzal Ahmad, one of the two remaining legislators of the state CPI, joined the SP bringing its strength in the assembly to 129) Besides, given the meagre support base the Congress(I) has in the state, as was once again demonstrated in the last assembly elections the central leadership of the party may not like to further antagonise the large OBC and dalit populace of UP which has, over the years, gradually withdrawn its traditional loyalty to the Congress(I) and has shifted itself to backing the SP and BSP As such the UPCC is likely to be persuaded to manoeuvre itself into a position which is tactically more politik

The issue in the current crisis in UP, therefore, is not the (un)likely withdrawal of support by the Congress(I) to the SP-BSP combine Nor is it the continuing threat by the Joint Action Committee spearheading the over a month-long agitation against 27 per cent reservation for OBCs, the agitation has only helped the combine to paper over to some extent the differences between the two parties that had, a couple of months ago, threatened to snowball into a real crisis for their government

The issue that this crisis has thrown up is the chronic underdevelopment of the eight hill districts of the state that comprise the region called Uttarakhand, and which is the real reason behind the current agitation Although the issue has manifested itself in the form of a protest against the reservations for the OBCs, and the BJP has expectedly attempted to take advantage of the protest to prop up its sagging image in the state, there is substance in the argument, put forth with varying emphasis by the Joint Action Committee, the Uttarkhand Kranti Dal (UKD) and the BJP, that special provisions need to be made to bring the Uttarakhand region, economically and educationally, up to the level of the more developed regions of the state

The underdevelopment of this region is basically rooted in the large-scale exploitation, over the years, of its forest wealth, which has disrupted the traditional structures of its economic and social life without replacing them adequately with alternative patterns Moreover, the region remains under-represented in the state and national legislatures sending only 19 MLAs and four MPs, respectively, to these legislatures This has contributed to the continued neglect of the region on the part of successive governments and particularly the government headed by Mulayam Singh Yadav whose party, the SP, secured just two seats from the region Parties behind the current agitation, including the BJP, have demanded a separate state for the hill region Some other state parties, including the CPI, too, have justified this demand Short of creating a separate state, however, always a major decision and not without political consequences, there is sense in the CPI(M)'s suggestion for instituting a Hill Development Council to give greater autonomy to hill districts

EDUCATION

Dismal Picture

THE habit of making tall claims backed by false figures continues to be a common practice with almost all ministerial departments, in spite of periodic embarrassing disclosures that expose the lies The latest report (of a study conducted jointly by the National Council of Education Research and Training, the National Institute of Educational Planning and Administration, and New Concept) reveals the actual state of affairs behind the official claim of rising enrolment in

primary schools—a claim which bolsters India's image abroad.

The findings of the report indicate the quality of education that is being imparted to Indian children—including those of poor parents who spend their life-time savings on educating them. Earlier reports had confirmed suspicions about the quantitative claims made by the government regarding enrolment in primary schools, while the latest report reinforces the doubts that many had voiced all these years—that the education being imparted to even the few who can afford, or want, to attend the primary schools is qualitatively much below minimum standards. About the falsity of the quantitative claims, some time ago the report of the Committee for Review of National Policy on Education concluded on the basis of a number of studies that the "actual number of children attending schools even in Classes I and II is *far less* than what is claimed officially." Explaining why it was so, the report stated " since teachers [of the primary schools] are under pressure to show better enrolment targets, they keep the names of these children [who are drop-outs] alive in their registers."

Now the latest report on primary schools (covering 50,000 students in 46 districts in the states of Assam, Haryana, Kerala, Karnataka, Maharashtra, Orissa, Madhya Pradesh and Tamil Nadu), commissioned by the education department, which should make it an officially recognised document, exposes the professional incompetence of these primary school teachers, and the inferior quality of the lessons they impart to the children. The report brings out that less than half of the Class IV and V students were able to pass a basic arithmetic test given to them during the survey. It then attributes this to their teachers by pointing out that in some districts like Karbi-Anglong in Assam, Gajapati in Orissa and Betul in Madhya Pradesh there were a large number of primary school teachers who had not even studied up to Class X, the minimum qualification for a primary school teacher. The team of investigators during the survey examined some teachers in one of the states in Class V arithmetic test and found that more than 83 per cent of them could not do an LCM sum.

While all this reveals the appalling state of primary education even after 47 years of independence, no useful purpose can be served by shifting the blame on the shoulders of the ill-equipped and ill-educated teachers of the primary schools. Primary education had been the responsibility of the state and yet, as the report indicates, the local administration in the districts had been totally indifferent to the need for equipping teachers with even basic requirements like chalk or blackboards. More than two-thirds of the teachers interviewed in these districts complained that they did not get any help from the government-appointed block education officers who, under their service rules, were required to visit the schools and supervise the teaching. Several block education officers, according to the report did not even know the location of the primary schools which were under their administrative jurisdiction.

What emerges from this bleak scene is the harsh fact that the reality in village India will continue to refute the tall claims that New Delhi might make at international forums in order to impress the World Bank and other foreign aid donors and its public relations campaign to seduce multinational concerns with promises of a readily-available labour force of skilled and educated personnel necessary for new hitech jobs. Like much of our manufactured goods that we export this labour force might also turn out to be of sub-standard quality when put to test judging by the type of education that they are getting in the schools.

MEDICARE

Unsafe Hospitals

THE death of 15 children in Bombay's Cama and Albless hospitals last month due reportedly to meningitis is yet another indication of the growing inefficiency which has come to characterise public health services. These new-born infants were not admitted to the hospitals because they had infection; they contracted meningitis as a result of septicemia and 'other causes', all related to unhygienic practices, in the hospital. In other words, their chances of survival would have been better had they not been in the hospital—a portent of the coming Illichian nightmare.

Under the circumstances the 'steps' taken by the dean and supported by the state government make a mockery of the very purpose for which a medicare institution exists in the first place. The hospital authorities have stated that when the unusual rise in deaths due to meningitis was noticed—only in the first week of September—the hospital appointed a committee of experts to look into the matter. On the basis of their report the hospital is undertaking disinfection of two wards and 'high risk' areas like the operating theatres, labour rooms, etc. The authorities have been at pains to state that the hospital is functioning normally with the emergency labour room and the OPD open. The point quite ignored by the authorities is that even one case of infant death due to meningitis should have been investigated. Why did they wait for 15 infants to die? And if the investigation had taken place earlier the reasons for septicemia, which the authorities are now saying is a result of the insanitary conditions in the hospital, may have attracted notice.

Most importantly, the tragedy highlights the urgent need for better administration of hospitals. For, not only is there a lack of funding and personnel in state services, but the public sector today has suffered a deterioration on all counts. Norms of hospital practice for which the Bombay hospitals were at one time well known, have eroded. The practice of investigating every unusual death is no more a matter of routine. Add to this the fact that the image of a public hospital has suffered tremendously. If public hospitals are today assumed by general consensus to be dirty, unhygienic, inefficient and staffed by mediocre doctors and nurses, then there is little scope for those in it to aspire to be efficient. This is not to condone the irresponsibility of hospital staff with regard to hygiene and care. But certainly, the state's growing de-emphasis of the public sector has an impact on more than the financial aspects.

The state government may well agree to set up a high level probe into the deaths. But unless there is a determination on the part of the government or those who staff public institutions to create a different public response to the public systems, recommendations, however radical, will only remain on paper. And this implies a concerted attempt to influence the government not only to change its priorities and increase state funding but to reassess medical priorities, norms and practices in these institutions and the retraining of medical, paramedical and other staff.

HUMAN RIGHTS

Criminals in Uniform

THIS is not really for the first time that the Punjab chief minister's progenies have indulged in criminal acts from under the protection of security guards provided at state expense. But this is perhaps the first time that the cognisance of such a crime has followed, and followed without inordinate delay. A young French woman visitor was reportedly followed at night from a Chandigarh restaurant to a house at Mohali, some way off from the town, by a gang, some of whom were in uniform. From the Mohali house the French girl was forcibly picked up by the uniformed criminals and carried off in an unmarked car to a place where the girl was molested

by the gang. The victim luckily was able to escape from the place of confinement the next morning, after which she lodged complaints with the authorities. It took the local police 48 hours to make a move. Reportedly, the police needed a nod from the chief minister before it acted, as the impugned policemen were the security details of one of his grandsons.

It is to be hoped that the trial and punishment of the alleged heinous crime would follow swiftly. In case any of the chief minister's grandsons is found to have been involved in the crimes, his security guards must be withdrawn along with other punishments under the law. A single paisa from public funds must not go either for aiding the criminal pursuits of or providing security to such criminals.

Not only the isolated Chandigarh case, the entire range of questions related to the crimes and punishment of the criminals in uniform needs public scrutiny and vigorous corrective actions. The shocking facts detailed in the first annual report of the National Human Rights Commission do not really reveal any secret. The broad nature of the prevailing violations of human rights was well known. But the examination of some of the sample cases out of the 3 000 complaints of police atrocities, many of them committed under the protection of TADA, received by the commission, gives a comprehensive view of the enormity of the crimes committed by the police, mostly in the interest of the powers that be within the institutional power structure as well as at various levels of the social hierarchy.

The facts and issues of this report must be made one of the main planks in the campaign for the coming round of state elections. The murky face of the regime must be exposed and adequate protection of human (that is essentially democratic) rights must be ensured to the extent possible under the present social regime.

MONTREAL PROTOCOL

In Whose Interest?

IN 1986 during discussions leading up to the finalisation of the Montreal Protocol, third world countries had been adamant about ensuring that the economic burden of phasing out CFCs should not fall on their already stretched economies. It was argued that while industrial nations could afford to phase out CFCs and develop alternatives, third world nations would find it difficult to transform existing technologies based on CFCs without injuring the nascent industrialisation process. In setting deadlines for phasing out of CFCs, the third world was allowed an [illegible] 10 years. Industrialised countries were to phase out CFCs by 2000, a deadline subsequently brought forward to 1996, and third world countries by 2010. Meanwhile, however, MNCs manufacturing CFCs were allowed to continue producing 10 per cent of their 1986 capacities for the specific purpose of exporting to developing countries where indigenous production could not cope with demand.

The Protocol was ratified by India and 127 other countries in 1987 and it has had an odd impact on the industry. At that time there were only a few manufacturers of CFCs producing about 3000 tonnes annually. Today, somewhat ironically, the industry has a capacity to produce 20 000 tonnes and exports about 2,000 tonnes to south and west Asian countries. This development has come about as a consequence of CFC producers getting their act together in response to what they see as a threat from the MNCs which heavily influence what is termed the Ozone secretariat which monitors implementation of the Protocol. In 1993 the MNCs succeeded in getting the secretariat to allow them to raise their production to 15 per cent of the 1986 level in order to supply the growing Asian markets. While it is natural that the Indian manufacturers are perturbed given the growing markets for the product used in a range of consumer products such as refrigerators, air-conditioners, aerosols, etc, these developments raise some pertinent questions on the impact of international agreements and protocols.

While it is true that the Indian manufacturers will lose export earnings if pushed out of the international markets by MNCs, should they and the government not be more concerned about the lack of movement on the development alternatives? There is clearly nothing unenterprising about Indian industry which has done its best to exploit its investment in plant and technology to the fullest not only in the domestic market but by developing markets abroad. The secretariat's latest notifications setting out new conditions demanding that third world importing nations provide detailed accounts of how CFCs have been used and that CFC producers submit annual reports of requests from these countries, have met with a sharp response from Indian manufacturers, according to a report in *Down to Earth*. They see this as an attempt by the secretariat to protect the interests of the MNCs which are being threatened by the expanding markets of third world producers. While this reasoning may well be valid, at what cost is Indian industry, manufacturing a product clearly damaging to the environment, to be protected?

TWENTY YEARS AGO

EPW, September 7, 1974

Some months ago, a Lok Sabha member of the ruling party spoke effusively of the virtues of limited dictatorship. Many assumed at the time that he was merely speaking out of turn. But the manner in which the railwaymen's strike was put down was an object lesson in authoritarian precision. It further confirmed one's misgivings that few national newspapers care—or dare—to write in detail about the disgraceful acts indulged in by the minions of offi-cialdom at such or other times. Only some foreign newspapers carried details of repressive official activity; one is sometimes driven to look up *Le Monde* to learn about some of the doings at home. The moulding of the public media to serve the government's cause is, indeed, now complete. There is no longer even the felt need to keep up pretences; the story is rapidly going round as to how a prominent econo-mist's marginal comments, in the course of a radio discussion, on the repression let loose against the railwaymen and their families was firmly scissored out of the broadcast. Such instances are multiplying with every day. Protests remain ritualistic as they are not backed up by political mobilisation.

Nevertheless economic discontent is likely to intensify as nature has ceased to co-operate on growth forecasts and as the policies adopted so far have left the root causes untouched. In the deepening discontent, the vacuum of lack of opposition—either nationwide or regional—is going to be even more suffocating. The discontent would thus seek an outlet, and the people's wrath might explode in events and episodes resembling chapters from the annals of anarchy. Inside the government, the view would be expressed that such bouts of anarchic outburst are fatal for the nation's long-term viability. Yet others might argue that such explosions would further damage the prospects for price stability and growth. Quite a number belonging to the ruling party honestly believe that the failure of the organised opposition to behave responsibly has given rise to anarchic trends, which bring fascism in their train. With a little bit of conditioning, a majority of them might be only too willing to acquiesce in the adoption of extraordinary measures to fight that menace of approaching chaos, for, better a limited suppression of democratic rights than a take-over by the forces of anarchy and disorder.

LIC Housing Finance

PROMOTED by Life Insurance Corporation of India with equity participation from premier financial and investment institutions like the UTI, IFCI and the ICICI, LIC Housing Finance (LICHF) is entering the capital market on September 15 with 1,89,18 000 equity shares of Rs 10 each at a premium of Rs 50 each aggregating Rs 11,350 8 lakh Subsequent to the issue, LIC will hold 38 46 per cent of the company's equity and 36 3 per cent will be held by UTI, ICICI and IFCI The LIC Housing Finance has a wide network of offices throughout the country making it easy for the consumers to avail of the benefits of its various housing finance schemes Within a short period of its existence the company has disbursed cumulatively housing loans to the extent of Rs 1,348 60 crore by March this year The company has stupendous scope for expansion considering the fact that the demand supply gap in the housing sector is increasing rapidly and the projected shortage in the year 2001 will be 41 million units, a rise of 94 per cent over the figure in 1991 Other than inevitable external risks like change in policies which would affect the financial sector as a whole the internal risks are minimised as the company has long experience in the business The issue is lead managed by ICICI Securities and Finance Company DSP Financial Consultants and SBI Capital Markets

International Comptech Engineering Services

International Comptech Engineering Services (ICES) an Ahmedabad based public limited company is setting up a 100 per cent software export oriented unit (EOU) at Software Technology Park (STP) in Bangalore at a capital cost of Rs 1 500 lakh which is a co venture promoted by Softech Management Services(SMC) INC Ontario Canada and VMC Project Technologies India The project aims at exporting software packages for special construction and integrated engineering solutions and extended reverse engineering services through STP 64 KBPS global satellite network The foreign collaborators are to have a 50 per cent equity stake in the project Paul Hewitt president of SMS, Canada, is to be a director of ICES The company is coming out with a public issue of 88 00,000 equity shares of Rs 10 each at par aggregating Rs 880 lakh on September 19 to part finance its new project While the promoters' contribution would be Rs 520 lakh, the balance of Rs 100 lakh will be lent by Canara Bank which is also lead managing the public issue The company has obtained approval from the government of India as a 100 per cent EOU to export software for engineering applications and CAD/CAM/CAE and Digital Mapping Services to service its global clientele through satellite network The project is to have the most sophisticated hardware and system facilities

Agri-Marine Exports

Promoted by three experienced business men Ramanathan Muthu (chairman), K D Madan (vice-chairman) and Ehjaz Elias (managing director), Agri-marine, one of the prominent seafood exporters, is a 100 per cent export-oriented unit (EOU) The company's exports include shrimps lobsters cuttle fish, squid, clamps mussels octopus snail meat and a wide variety of other fish To part finance its expansion project of Rs 800 lakh, the company is coming out with a public issue of 32 64 000 equity shares of Rs 10 each for a premium of Rs 2 50 per share aggregating Rs 408 lakh the rest of the project cost is being financed by term loan (Rs 272 lakh) and promoters (Rs 120 lakh). The company already has a plant at Kaladipet, Madras with a total processing capacity of 1 500 mtpa It also has 100 mt capacity of cold storage facility and an ice producing capacity of 2 500 mtpa The company now plans to set up plants with additional processing capacity of 4 500 mt and freezing capacity of 250 mt The company also proposes to purchase four refrigerator container vans to transport the processed products and raw materials and a modern individual quick freezing machine (IQF) which is being imported The company has been successful with its new products in the international market It has also entered into processing and marketing of fresh water fishes to the UK The company secured the US FDA A category certification in 1992 The company has marketing tie ups with major companies in the UK, Italy, France Japan and West Asia It also has a long standing association with J and C International for buy-back of 60 per cent of the installed capacity The company plans to begin its commercial production with its added capacity by April 1995 The issue will be lead managed by Foresight Financial Services and Indbank Merchant Banking Services

Gem Cables and Conductors

Gem Cables and Conductors, a Hyderabad based company engaged in the manufacture of cables and conductors including alloy conductors, is all set for an expansion programme To part finance the project the company is entering the capital market on September 21 Hitherto a closely held company now going public, it is coming out with a public issue of 24 lakh equity shares of Rs 10 each at a premium of Rs 10 aggregating Rs 480 lakh the total cost of the project being Rs 720 58 lakh A major part of the project cost that is Rs 480 lakh will be used to finance the long-term working capital requirements and hence to that extent there will not be any addition to the company s fixed asset The company has confirmed orders worth Rs 1,828 lakh The company s thrust on quality has paid off since it enjoys a zero rejection record since its inception It has obtained the ISO 9002 certificate and has bagged the 'Outstanding Performance award for the past two years from the Council of Industrial and Trade Development The company also has a research and development centre and has been successful in developing risk reducing cables indigenously The lead managers to the issue are Credit Capital Finance Corporation and Bank of Baroda

Pentafour Products

Pentafour Products the flagship company of the Pentafour group from Madras has a wide range of activities in various field like electronics auto components refrigeration and air-conditioning solar energy speciality chemical software export and training The company is now embarking on an expansion project with a capital outlay of Rs 105 crore to be met through a rights-cum- public issue of Rs 96 crore and Indian and foreign loans worth Rs 9 crore

The project under the electronic division is to manufacture FR4 Grade Glass Epoxy Copper Clad Lamination under Electronic Hardware Technology Park (EHTP) Scheme in collaboration with Nationwide Circuits Products who have been in the field for a quarter of a century The collaborators have underwritten the entire production for a period of 10 years The company's new chemicals division in Cuddalore is establishing a sulfonation plant for the production of anionic surfactants in collaboration with Chemithon Corporation USA which is also the world market leader Chemithon Corporation has given a firm buy-back of 30 per cent of the production for their market The company is also expanding the capacity of its auto division for carburettors, water pumps and fuel pumps to meet the rising export and domestic needs The expansion programme for the auto division is to be completed by October this year The company is coming out with its public-cum-rights issue of fully convertible bonds (FCBs) of Rs 360 each aggregating Rs 96 crore The rights issue will be in the ratio of 5 FCBs for every 100 shares held and will consist of 4,80,210 bonds The public issue will consist of 14,64,000 FCBs of which 1,00 000 bonds will be reserved for preferential allotment to the shareholders of Pentafour Software and Exports while 3,00,000 bonds would be reserved for the NRIs The bonds are convertible into 10 equity shares after six months of allotment at a premium of Rs 26 each The lead managers of the issue are Indian Overseas Bank BOI Finance, and Sterling Holiday Financial Services

CURRENT STATISTICS

EPW Research Foundation

A distinct aspect of the current inflationary situation is the accelerated increase in the cost of living indices during the past 12 months, though in recent weeks the increase in WPI has been edging downwards and the wholesale prices of food articles have also moderated. The highest 12-month rise in wholesale prices is to be found in non-food articles. In the monetary sector, a peculiar situation of growing liquidity bulge has arisen due to reduced bank credit demand from both the commercial and government sectors. As a result of a sizeable contraction in net RBI credit to the central government, the reserve money growth has also been considerably arrested. In the share market, the BSE sensitive index has attained yet another peak at 4,551 as the day's closing quotation, showing an over the year rise of 76 per cent.

SANDOZ

Gearing Up for Competition

SANDOZ (INDIA), the Indian subsidiary of the Sandoz Group of Switzerland, has not performed well during the year 1993-94, it has registered only a marginal increase in net sales of 4 2 per cent and in operating profit of 5 4 per cent In fact, the company's net profit has declined by 11 3 per cent, despite a significant reduction in tax provision by 10 3 per cent and interest burden by 47 8 per cent Even though the performance of the company has not been very encouraging, it has announced a dividend of 25 per cent as against 20 per cent last year

The company has argued that with a view to ensuring its long-term viability and helping restructure its business to face competitive pressures in the liberalised economic environment it has implemented a voluntary retirement scheme (VRS) for which 535 employees opted and which cost the company Rs 16 90 crore as compensation As a result the company's expenditure on salaries and wages increased by 60 5 per cent

The company has diverse businesses like pharmaceuticals agroproducts, chemicals and seeds The company's pharma business had been sustaining losses for several years and therefore it has been relying more on its other areas of production However, of late its pharma business has been picking up, with sales registering a 29 per cent growth in 1993 94 as against the previous year Even so, the company claims that uncertainty regarding the new drug policy continues to affect the unit The company's agro business remained low this year with little increase in sales Its chemical business has fared well with sales crossing the Rs 100-crore mark in 1993-94—a 24 per cent increase over the preceding 12 months The company's seeds division has also fared well with increasing sales and profits The company's exports have gone up by 23 per cent, the main contributor being made by its chemical division

The company has been upgrading and developing its infrastructure It has achieved the distinction of being the first affiliate company of the Sandoz Group to be awarded the ISO 9002 certificate At its Kolshet plant in Maharashtra, the company has successfully completed the development of the incinerator project for burning its toxic waste in a cost effective manner Modernisation of the dye plant has also been completed At its Kandla plant the pharmaceutical plant was utilised to meet export orders, while the agro plant was idle due to lack of exports The Panoli chemical and agro plant capacities were well utilised However, the company spent only Rs 31,015 on Research and Development during 1993-94

COLOUR-CHEM

Modernisation Programme

Colour-Chem, a subsidiary of Hoechst AG, has shown improved performance in 1993-94 The company's net sales have gone up by 19 8 per cent mainly due to an improved performance in the first half of the year and it has experienced a significant rise in net profits (76 2 per cent) essentially as a result of an improvement in operating profits, but a sizeable reduction in interest burden following reduction in debt equity ratio has also helped the company's bottomline Tax provision was only 24 per cent of gross profit against 37 per cent in the previous year Gross profit to sales ratio at 14 4 per cent during 1993 94 has been one of the highest in recent years The company has announced a dividend of 30 per cent for 1993 94 compared to the previous year s 25 per cent

Colour-Chem has upgraded and modernised its manufacturing facilities at its Thane and Roha plants incurring a capital expenditure of Rs 1,465 lakh It also has a joint venture with Haycolour in Sri Lanka which registered a turnover of SL Rs 673 34 lakh with a net profit of SL Rs 20 46 lakh and has announced a dividend of 22 per cent The company also has two subsidiaries, viz Vanavil Dyes and Chemical (VDCL) and Kundalika Investments, both of which have done well VDCL has produced a gross turnover of Rs 2,846 lakh in 1993-94 as against Rs 2,325 lakh in the previous year and raised its dividend to 17 per cent from 15 per cent in the previous year Kundalika Investments has also performed commendably this year, with its net profits amounting to Rs 4 79 lakh as against Rs 1 78 lakh last year and has for the first time in its 12 years' of operation, announced a dividend of 10 per cent

With its status as a registered export house, Colour-Chem's increase in foreign exchange earnings this by 32 per cent over the preceding year reflected a rise in the share of exports in total sales to over 20 per cent from 16 per cent two years ago The company claims excellent industrial relations at its factories and other establishments Being an export house, Colour-Chem is making use of sophisticated information technology to meet its corporate objectives The company is also conducting various intensive training programmes to enhance its operational efficiency, upgrade its quality standards and increase its productivity levels to match market standards The company has invested Rs 173 lakh in Research and Development with the focus on technology used for dyes, various intermediates and performance chemicals meant for the local and export markets

ALFA LAVAL

Successful Indigenisation

Alfa Laval (India), a subsidiary of Alfa Laval AB of Sweden, has performed well in 1993-94 with net sales going up by 28 per cent Following rising operating cost the company's operating profit rose only by 5 7 per cent Even so, its net profits have increased by 26 per cent due to a significant growth in non operating income by 62 per cent and a striking reduction of 39 per cent in interest burden The company has pushed up its dividend rate to 30 per cent for the year 1993 94 against 25 per cent in the previous year The company enjoys an unusually low debt-equity ratio at 2 7 per cent but a high ratio of short term bank borrowings to inventories at 57 per cent The company has been achieving phenomenal addition to gross fixed assets in recent years, its value arising from Rs 20 crore in 1992 to Rs 51 7 crore in 1994

The company s wholly-owned subsidiary Alfa Laval (India) Leasing and Finance ventured forth with its operations during the year 1993-94 and has registered an operating profit of Rs 11 9 lakh and a net profit of Rs 0 33 lakh The leasing and finance company has firm commitments for lease and hire purchase of industrial machinery worth Rs 52 2 lakh Alfa Laval holds 49 per cent of equity in Saunders Valves (India), which has reported a net sales turnover of Rs 4 77 crore and a net profit of Rs 82 lakh Lavrids Knudsen Maskinfabrik (India) is another associate firm in which the company has 49 per cent equity stake Its sales turnover was Rs 7 56 crore in 1993-94, while its operating profit was Rs 77 lakh

The company intends to promote a new company in association with Asea Brown Boveri (ABB), an associate of ABB Stal Refrigeration AB Sweden which has a worldwide reputation as a leading manufacturer and supplier of refrigeration plants and allied products The unit, for manufacture and sale of refrigeration plant including modern reciprocating compressors, screw compressors and allied products, parts and components, will be located in Maharashtra and will have technical know-how and support from the Swedish company

The company has been awarded the ISO 9001 certificate by Lloyd's Register Quality

* 15 months.

Assurance (LRQA), UK, for its Thermal Business Group. It has set up a Technology Centre which is fully equipped with pilot plants, analytical laboratories, computer centre and training rooms. The company incurred an expenditure of Rs 5.17 crore on Research and Development and has been successful in indigenising certain critical components which has helped in cost reduction.

PUDUMJEE PULP

Fruitful R and D

Pudumjee Pulp and Paper Mills, a Pune-based company, is engaged in the manufacture of all varieties of paper, paper boards, paper products and cellulose pulp. During the year ended March 1994, the company registered an increase in net sales by 7 per cent, operating profits by 9.3 per cent and net profits by as much as 57.4 per cent, essentially due to extraneous factors like a significant decrease in depreciation (23.37 per cent) and tax provision (21.19 per cent) and also a low interest burden of 1.16 per cent. The gross profit to total assets and gross profits to sales ratios have been at a high of 15 per cent and 18 per cent, respectively. The company also experienced an increase of inventories by as much as 47 per cent.

The company had proposed an expansion-cum-modernisation project, which it has not been able to implement successfully due to delays in deliveries of equipment. It is expected to be fully operational by December this year. Pudumjee Pulp and Paper Mills has invested Rs 33.54 lakh in Research and Development. R and D was carried out in the development of new products, pulp quality improvement, environmental pollution control and cost reduction and development of a new tissue culture plant. The company has not imported any new technology in the last five years.

Gresham Investments and Finance, which was earlier a subsidiary of Pudumjee Investments and Finance, has now become a subsidiary of Pudumjee Paper and Pulp Mills. Of the two subsidiaries, Pudumjee Investments and Finance has done well and has declared a dividend of 28 per cent while Gresham Investments and Finance has run into a small loss.

The company has been trying to develop an export market for its paper, but has not met with success due to stiff international competition and high cost of raw materials. Besides exporting locally purchased de-oiled cakes, the company has started export of tissue culture ornamental plants which is expected to pick up substantially in the coming years. With the demise of its chairman S L Kirloskar, the deputy chairman M P Jatia, was appointed chairman.

TCI

Diversified Operations

Transport Corporation of India (TCI), a leading transport operator in the country with diversified activities, has performed well in 1993-94 with turnover increasing by 35.4 per cent and operating profit by 16 per cent. The company has made no provision for taxation, thus achieving a significant rise in net profits by 39.4 per cent. The growth of 32 per cent in the company's fixed asset in 1993-94 stands out.

The transport division's turnover registered a growth of 19 per cent and that of the shipping division has grown by 23 per cent. The cargo division (called Gati desk-to-desk service) has expanded with 70 branches and six zonal offices. Bhoruka Aluminium, a subsidiary of TCI, has achieved a high turnover and also exports during the year. The Wheels Rent-A-Car division has earned a fair amount of foreign exchange during the year. The company started a new money changing division called Transcrop International Bureau D'Exchange last year, which was initially operating only in Bombay but has now expanded its network to five other major cities. The lease division, Transcrop Lease Finance, commenced operations in the last month of the year and has now entered into leases contracts with reputed companies. The company's appeal in the Bombay High Court against the tribunal order rejecting the application of Mukesh Textile Mills seeking its closure is still pending.

CUREFAST REMEDIES

Higher Dividend

Curefast Remedies which is engaged in the manufacture of specialities as well as generics covering antibiotics, analgesics, antianeobic, antispasmodic and dental products, has earned a net profit of Rs 28.6 lakh on a turnover of Rs 3.8 crore for 1993-94 as against a net profit of Rs 2.4 lakh on a turnover of Rs 1 crore last year. The company has raised the dividend rate from 7.5 per cent last year to 10 per cent in 1993-94. In the current year the company plans to expand its marketing territories and launch new products. The number of employees has risen from 40 in 1990 to 150 in 1994 while the number of products has increased from 35 to 72. In 1994-95 it plans to notch a net profit of Rs 1.7 crore on a turnover of Rs 15 crore.

JAIHIND GRANITE

Diversification

For the year 1993-94, Jaihind Granite Industries, a Bangalore-based Bhansali group company, out-performed its projections made at the time of its public issue in May 1993. The company has proposed a dividend of 18 per cent after notching up a turnover of Rs 52.4 crore for the period as against a turnover of Rs 7.3 crore in 1992-93. Encouraged by its performance the company now plans to go in for major expansion-cum-diversification in the areas of software, construction, infrastructure, power and exports. The government's decision to give a five-year tax holiday to new projects in the power sector and the exemption of export profits from tax have brightened the prospects of the private power sector, merchant exports and software exports. The company's expansion plans which are estimated to cost around Rs 127 crore will be financed through placement with FIIs and a rights-cum-public issue. To reflect its diverse interests in the future the company plans to change its name to CRB Corporation.

SAHAS AGRO

Export Unit Status

Sahas Agro, a Meerut-based company engaged in the production of white button mushrooms, has been extended 100 per cent export-oriented unit status by the Department of Industrial Development under the Ministry of Industry. The company, which presently caters to the domestic market with a capacity of 280 mtpa, is now expanding its capacity by another 1,140 mt in technical collaboration with Macon Agri, Ireland. The Irish company will also buy-back 100 per cent of the production on expanded capacity for the next five years.

Etymology of Liberalism and Efficiency

Arun Ghosh

Let us take a quick look at the present policy of 'economic liberalisation' and how it conforms to the concept of 'liberalism' on the one hand and that of 'equality of all citizens before the law' on the other.

THE Shorter Oxford English Dictionary (1987) defines 'liberality' as "freedom from bias or prejudice" To liberalise, in turn, means "to free from narrowness, to enlarge the intellectual range of" (I am not giving all the other meanings of 'liberalism', one of which relates specifically the membership of the Liberal Party in the UK, nor the meaning of liberality in the sense of generosity, munificence) Ralf Dahrendorf defines liberalism more in tune with the political philosophy of John Locke (among others) "Its central idea is liberty under the law People must be allowed to follow their own interests and desires, constrained only by rules which prevent their encroachment on the liberty of others" (R Dahrendorf, 'Liberalism' in *The New Palgrave* (ed), Eatwell Milgate and Newman, W W Norton, New York and London, 1989)

One observes a subtle, an almost invisible move, in Dahrendorf, from the political philosophy aspect of liberalism to the economic aspect, from the concept of equality of all under law to the pursuit by each of his own self-interest (provided one does not impinge on others' liberty to do likewise)

Dahrendorf adds that the notion of the "rule of law, is not without ambiguity A certain tension between liberal thought and the notion of natural rights is unmistakable" And indeed, as of recent times, according to Dahrendorf, "liberalism died a 'strange death', it ceased to be a source of reform and became a defence of class interest" This is an important admission from one who is otherwise 'a Defender of the Faith'—faith in the neo-classical view of liberalism

The Constitution of India, very carefully drafted by the founding fathers of the Indian republic, is quintessentially liberal in outlook, form and substance The Fundamental Rights supposed to be enjoyed by every citizen (under Part III of the Constitution), read with the Directive Principles of State Policy (in Part IV of the Constitution), make—at one and the same time—provision for equality before the law (of all citizens), *and* an attempt to redress the existing unequal distribution of resource power (to be brought about through the exercise of the Directive Principles of State Policy)

There can be no question that the Constitution of India is imbued with the highest traditions of liberal philosophy Indeed, if the case law in respect of Article 14 of the Constitution is carefully analysed, the simple sentence "The State shall not deny to any person equality before the law or the equal protection of the laws within the territory of India" would be seen to have now acquired a significance and an importance which is sadly missed, not only by the lay public but also by those on whom vests the responsibility for the governance of the country

To cite the most significant example, in a historic judgment, the Hon'ble Supreme Court of India (in, Maneka Gandhi vs the Union of India, 1977) not oly conferred on all citizens of India the Right to Information, but also the criteria of openness of governance and equality of opportunity for all citizens, within the territory of India There are other similar traditions built up over time, in case laws, traditions which, regrettably, are openly flouted in the process of administrative decisions

It is for legal pundits to explore the full implications of the historic (1978) judgment of the Supreme Court in regard to political freedom (and freedom of expression) for all Indian citizens throughout the length and breadth of the country, circumscribed as that freedom is today by the TADA and a host of other restraints

But at this point of time, we are on a wholly different track, we seek today to explore the consistency of the present government policy of 'economic liberalisation' (or economic reform, as many choose to designate the on-going policies) with the meaning of the word liberalisation, as well as with the quintessentially liberal constitutional provision of 'equality before the law' of all citizens

Going back to the Oxford English Dictionary meaning of the word, economic liberalisation should involve the removal of restraints (on individuals) from economic activity, without bias or prejudice The Constitution of India enjoins such freedom for all citizens of India (and we may perhaps extend the definition to include all Indian institutions, including corporate bodies)

An aside at this juncture may be excused Nearly 16 years back, the government of India had appointed (in May 1978) a high-level committee on controls and subsidies (popularly known as the Dagli Committee) That body submitted its report in May 1979, with recommendations which suggested the removal of as many (avoidable) restraints on economic activity as possible, with very specific recommendations for each sector Though that report is no longer relevant, it should be noted for the record that the report was 'filed'—for there was a change of government soon after the report was submitted—and the report was not even considered by the successor government, nor released (for public debate) In India, obviously, the process of 'liberalisation' has to be 'imposed' by outside experts, not as per the suggestions of Indian social scientists, and curiously, the great exponents and implementers of present-day economic liberalisation were precisely the gentlemen who consigned the report of the Dagli Committee (on controls and subsidies) to oblivion (The present finance minister was then the economic secretary in the union finance ministry) However, this is a digression, not strictly germane to the present discussion

Let us take a quick look at the present policy of 'economic liberalisation' and how it conforms to the concept of 'liberalism' on the one hand and the concept of 'equality of all citizens of India before the law' on the other One has necessarily to seek recourse to examples (rather than talk vaguely as to first principles)

Restrictions on Investments

There is no question that undesirable, administrative, bureaucratic restraints on economic activity are unwarranted But that does not imply that 'liberalisation' has to be coterminous with complete abandonment of 'planning' or a complete surrender to 'market-driven' investment and production, in a country which suffers from under-development, unemployment, lack of skills, poverty and extreme inequality in the distribution of income But that argument belongs elsewhere, in the realm of economic development theory, and we promised to avoid discussing first principles, we undertook to *illustrate* the divergence between thought and action even in regard to the process of 'liberalisation'

One may dismiss the case of the sugar industry as one with so many vested interests, and such ramifications of power politics that nobody dare introduce reform For, after all, there is, to begin with, the sugarcane lobby (the cane crop hogging all the irrigation

water available in Maharashtra, for instance) Then, there are the sugar barons—and we leave out the present sugar crisis (as being investigated by a retired Comptroller and Auditor General)—who exercise an inordinate influence on politics through their money power, not only from sugar but of late, and more particularly from potable alcohol made from molasses, a residue of sugar Hence, there has been no change in the sugar policy, all manner of reports (like those of the Dagli Committee and the BICP) notwithstanding

All right Let us accept that where there is sugar, there must be flies, and where there are flies, there must be disease Perhaps those in charge of governance of economic policy-making, are helpless in the matter of sugar (Why else appoint a one-man committee to probe the latest sugar scam when all facts are contained in a few very files, and the contents known to even outsiders?) Perhaps the government is powerless to act in this case, which—like the dark spots on the moon—may be accepted as an inevitable blemish in an otherwise very good policy framework

But the same dark spots appear, with some malignancy in almost every aspect of the policy of liberalisation Take the structure of import duties The liberalised policy permits the duty free import of equipment for power generation and for the manufacture of fertilisers when even the World Bank has categorically stated that the Indian manufacturers of power and fertiliser equipment suffer from negative protection

But apparently even the negative protection on domestic manufacturers is not enough, imported power generation equipment has to be forced on the country through profit guarantees given to foreign investors who are allowed to import their equipment without recourse to competitive bidding

Let us think this over Forget economic arguments, economic reasoning There is no 'equality between the foreign and Indian suppliers any longer

Liberalism one thought, meant "freedom from bias or prejudice" From a prejudice against imports, we have suddenly, in a space of three years switched over to a deep prejudice against the indigenous manufacturer, and this *not* because people are being "allowed to follow their own interest and desires "

Not only is the policy repugnant to the ideas of liberalism, the policy is violative of the Constitution of India in a number of ways There is extreme secrecy in the matter of the terms of the agreements between different foreign parties and the authorities, which is violative of the Right to Information included as a fundamental right under Article 14 of the Constitution in the historic (1978) judgment of the Supreme Court More That judgment enjoined the principle of 'equality', but apparently the foreign investor today is more equal than the Indian manufacturer, he can get away without competitive bidding even where the buyer (of the service or the output or the facility) is the government, and ultimately, the consumers, the people of India.

It is surprising that no legal luminary in India has yet instituted a 'public interest litigation' in the courts thus far against such blatant violations of the Indian Constitution, which include the sovereign guarantees being given by the government of India for a (tax-free) minimum return of 16 per cent to the foreign investor These guarantees can be met (if the need arises, and the need is certain to arise) only out of the Consolidated Fund of India But Articles 292 and 293 of the Constitution permit the government of India (and the state governments) only to *borrow* "upon the security of the Consolidated Fund of India" There is no provision for sovereign guarantees in the matter of repatriation of guaranteed profits out of the Consolidated Fund of India Again, any such guarantee given by any government (central or state) would be violative of the Constitution

One can understand the pursuit of a liberal' philosophy, though even Dahrendorf admits that "a certain tension between liberal thought and the notion of natural rights is unmistakable" We, each one of us, are entitled to our beliefs But when we parade our ideology as 'liberal', we need to be careful Liberal for whom? In whose interest? We need liberal thinking in the context of Indian society, and there is only lip service so far in regard to liberalism in the matter of religion, liberalism in the matter of the backward sections, liberalism in regard to women and their place in society

And regretfully, we need to hang down our heads in shame, when the issue is the place of women in Indian society, the place of the Scheduled Castes/Scheduled Tribes in Indian society So much for 'liberalism', *a la* Hobbes, Locke, Hume and a host of others

EFFICIENCY

We turn next to the problem of 'efficiency', since all neo-classical economists swear by 'Pareto optimality' or Pareto efficiency (Incidentally Pareto himself, and later, his pupil Enrico Barone, thought of the possibility of 'optimality' within a socialist framework But that is another story)

We need not go into the already well known critiques of the concept of 'Pareto optimality', since we have started by saying this is not a debate on a theoretical plane but an attempt to unravel the relevance of these concepts/policies in Indian society, through some obvious examples (Suffice it to mention here the well known critique by Amartya Sen that technically Pareto optimality'—a state where no one can be made better off without making someone else worse off—is consistent with widespread hunger and famine)

What is 'efficiency ? How do we define efficiency? At a micro level, there are clear parameters for judging the efficiency of

each unit of production. At a macro level, efficiency must be related to the overall aggregate efficiency of the entire economy

Again, let us take an example from current events The Maharashtra State Electricity Board has recently signed an agreement with Enron—a foreign company setting up a power project with a capacity 2,015 megawatts The MSEB has undertaken to buy the power generated at Rs 2 40 per unit to start with (The price would certainly escalate with time, there are built-in clauses in the Power Purchase Agreement to that effect) In a meeting in the Planning Commission some time back, the then Special Secretary (Power) stated vehemently that the agreement was in India's interest because Enron was going to be a highly 'efficient' unit He explained that Enron was going to operate at between 88 and 92 per cent of capacity On questioning he admitted that under the agreement with Enron, the MSEB was obliged to buy up to 92 per cent of Enron power capacity, if generated, with penalty clauses if the generation were to fall below a certain percentage of installed capacity The power secretary described this as a sign of the 'efficiency' of the foreign investor (Technically, given 24 hours in a day and 365 days in a year, 1 kilowatt of capacity working continuously would generate 8,760 units of power in a year Operating at, say, 90 per cent of capacity, this would imply supply of 7,884 units of power over the year But the point, to repeat, is we do *not* require 7,884 units of energy from every KW of capacity, we need much less)

Everybody was impressed This is the argument the Hon'ble N K P Salve has been trotting out in season and out, in India and abroad

But there is a catch Electricity is something you cannot store, it has to be used instantly At night, you do not need electric lights at home, maybe, you need a fan Most industries work either two shifts or one shift, small industries usually work for only one 8-hour shift This is where two concepts come into play 'peak demand' (during the day) and 'total energy demand' There is a substantial gap between peak and offpeak demand for electricity

Let us go back to Maharashtra In that state, 'peak demand' is around 71 per cent of total power generation capacity available, the MSEB (and other associated power units like the ones owned and operated by the Tatas) operate at something like 62 per cent of capacity, on an average

There *is* a small gap between peak demand and the capacity of the system to meet that demand, though one has to repeat that 62 per cent generation is average generation, not peak generation Where the gap is large, one can resort to 'demand management' (e g, supply electricity for irrigation at night, irrigation rates being highly subsidised)

Anyhow, in Maharashtra (as of 1990-91) the MSEB's cost (of generation, transmission and distribution) was around 115 paise per unit of power The MSEB would hereafter buy Enron power at 240 paise per unit Forget the overall increase in MSEB costs, if MSEB has to buy 92 per cent of the power from Enron, the generation of the rest of the system (MSEB and the Tata Electric Company) would have to perforce drop, from an average of 62 per cent to say 40 to 50 per cent

What exactly does that imply? The boiler cannot be shut down, so the flame is reduced, oil is injected to keep the fire going, power is not generated The costs go up, the output goes down, bang goes viability

Suppose the MSEB cost goes up to 150 paise, as a result of the above forced 'backing down' of the MSEB, the overall system efficiency would decline What is it that we are after? Efficiency of one preferred unit? Or overall aggregate efficiency of the entire production apparatus?

The above is one isolated example, but the 'economic liberalisation' policies appear to have generally had the effect of reducing the overall aggregative efficiency of the Indian production structure

This is more than apparent from the effect of the 'financial sector reform' which has been introduced Bank credit to the 'priority' sector has gone down from 40 per cent (in 1990-91) to 36 per cent (in 1992-93) The rate of interest has officially been lowered over the past two years, but whom has it benefited? The government now only prescribes a minimum rate, and the minimum rate for commercial bank lending has been lowered from 19 per cent to 17 per cent But small borrowers still have to pay 22 per cent or more to commercial banks, when the latter agree to make such loans at all In the informal sector—from where small producers have to obtain the bulk of their finance—the going rate is 5 per cent per month, or 60 per cent per annum By freeing the banking sector from its obligation to make loans to the priority sector (agriculture, small industries, etc) by stating publicly that the banks should lend only as per their commercial judgment with no ceiling on the rate of interest—without putting in place an alternative credit structure for meeting the credit needs of rural borrowers—have we promoted either the efficiency of the overall production system in the country?

By allowing import of power generation equipment, at much higher cost than that of domestic equipment suppliers, have we promoted either the efficiency of the economy as a whole, or even of the limited area of power generation?

How, in other words, does one define efficiency?

We have not cited the Oxford English Dictionary meaning of efficiency because therein the meaning of the word does not strictly relate to economic efficiency (being efficient is to be "productive of effects", an efficient person being "adequately skilled and active") The definition makes it, in legal parlance, 'an open and shut question' The Webster Dictionary, being American, comes closer efficiency is defined as "effective operation as measured by a comparison of production with cost (as in energy, time and money)" This is an acceptable definition, but again, when government intervenes in any manner—even in regard to the removal of earlier interventions—the efficiency of the measures can be judged only by the resultant overall aggregative efficiency of the entire production system, as compared to the earlier level of efficiency

And, if we were to judge by the overall rate of growth of the economy over 1991-92, 1992 93 and 1993-94, we would be seen to be far less efficient today than in the past

This essay is *not* concerned with the ongoing reforms, their rationale and their effectiveness The purport of this essay is to question those who assume (or who pronounce) that India has now become a liberal economy

India is *not* a liberal economy To be a liberal economy, India has to move strictly in accord with the direction laid down in the Constitution, in the Directive Principles of State Policy, in the matter of equality before law of all citizens of this country, in matters such as the Right to Information

Indeed, the so-called economic liberalisation policies have been violative of the Constitution Those in charge of governance need to recognise this

Old Hands at an Old Game

GPD

Indians and Pakistanis do not learn the lessons of history easily; all the same, there might not be a war between 'them' and 'us' after all.

THERE have been three-and-a-half wars (the little skirmish in the Rann of Kutch counting as half a war) between them (the Pakistanis) and us. Add to that the holocaust of the partition. One would think that this experience would make the people (who matter) in New Delhi and Islamabad pause and think before they turn relations between them into a theatre of the (cruel) absurd. Obviously, that is not the case. The subcontinental politicians and statespersons are a special and unique breed. It was in December 1989 that George Fernandes, then railway minister, came out with a statement on Tibet. In no other cabinet system would a railway minister issue a statement which has a bearing on foreign policy. Nawaz Sharief, the former prime minister of Pakistan, has announced that Pakistan is a nuclear power. Issues of defence, security and foreign policy would not be talked about so lightly and irresponsibly in other democracies. But South Asian culture or the essential unity of erstwhile India is demonstrated usually through such acts of irresponsibility. Fernandes provided an example; Nawaz Sharief has provided another; and Benazir Bhutto's proposed and now frustrated trip to the Gaza Strip is yet one more.

It is not our purpose to establish if Pakistan does or does not have nuclear weapons. In any event, the government in New Delhi would know if it has. Nawaz Sharief's statement that nuclear weapons could be used in an Indo-Pak conflict is what is crucial. Here then we have a leadership which can and does speak of conflict and the use of nuclear weapons quite freely. Sharief might have done so with an eye to creating problems between Benazir Bhutto and the Americans. His performance in London last week would suggest that he was trying to create his own version of Zulfiqar Ali Bhutto's 'Islamic Bomb' slogan. Essentially all this bravado seems to be a rather crude exercise in political one-upmanship, which is unlikely to do any good either to Pakistan or to India-Pakistan relations. At the official level, the American and Indian governments have reacted to the Nawaz Sharief statement with considerable caution and have tended not to make an issue of the Pakistani nuclear capability, whether real or otherwise.

But this makes it necessary that the deteriorating relations between India and Pakistan are attended to as early as possible. As long as the Kashmir situation remains what it is, this would appear to be near-impossible. It is possible to argue that the Indian elite was never so closed in its attitude to the idea of a normal, working relations with Pakistan. Many commentators have drawn attention to the sabre-rattling between India and Pakistan which is perhaps more threatening today than ever before. The dialogue between policy-makers in Islamabad and New Delhi is increasingly becoming a dialogue between the deaf, or perhaps between two people who do not understand a word of each other's language. They react to sounds and judge each other's tempers and react to them in equal measure. This is probably what the mutual expulsion of diplomats amount to. We have not yet seen the high commissioners themselves being expelled. But even that cannot be ruled out. After all, something similar had happened between India and China. It was not quite a case of expulsion. It was a case of withdrawal of ambassadors. One cannot rule out a repetition of that scenario between India and Pakistan. In short, Indo-Pakistani relations have never been so bad since the 1971 war as they seem to be today. Are we heading for another war? L K Advani thinks that we are. In his case we can blame a lot on the factor of wishful thinking. But is it only that?

Enough has been written on the prime minister's remarks in his Red Fort speech on independence day. Narasimha Rao acknowledged only one unaccomplished task in Kashmir and that was the recovery of that part of Kashmir which is under the occupation of Pakistan. Was this a kind of sabre-rattling? The PM assured the country that Kashmir would stay with us. Riaz Khokar, the Pakistani high commissioner, was listening to his speech and the Doordarshan cameras focused on him more than once. We once overheard him greeting an Indian journalist in chaste, Sanskritised Hindi. So he must have understood the PM's sarcasm when he said that Pakistan, he had heard, was planning to raise the Kashmir issue even at the conference of 'swasthya mantris' (health ministers). What does this new belligerence amount to and what does it mean?

It would seem that bellicose statements apart, there is unlikely to be a war between India and Pakistan. India does not need it. Pakistan does not want it. Benazir Bhutto is a 'modern' statesperson and fundamentalist jingoism that a war with India will inevitably generate will seal her future. Even Nawaz Sharief would not want a war with India. His nuclear bomb statement was irresponsible, but that is an 'Indian' weakness. But the essential unity of the subcontinent which takes different forms has made everyone aware by this time of the fact that joint suicide is usually attempted in a condition of love, rarely in one of hate. This is perhaps the reason why Indians and Pakistanis have been blowing hot and cold for the last two decades. This is a sub-continent of myths and mythologies. That is why Bhutto spoke of a 'thousand-year war'. That is also why Rao speaks of the recovery of the 'lost territory' in Kashmir. South Asian nationalism was once civilisational. Now it has become 'territorial'. But one should perhaps not read too much into these periodic rhetorical outbursts.

You might think that the words (and diplomats) lately being exchanged between India and Pakistan amount to a lot more than just rhetoric. Indeed, they do. Yet the chances are that they are not signals of an imminent conflict. Let us look at what Rao said on August 15.

The PM said that Kashmir would stay with us. This means that a piece of territory that belongs to us will stay with us. What you have is negotiable. This is one way of looking at the statement. Another meaning could be that the Indian prime minister was making a calculated reference to the ceasefire-line in Kashmir. The reference was calculated in the sense that in terms of bilateral relations the only reality that matters to India and Pakistan in Kashmir is that line. Insurgency or militancy in Kashmir is a separate issue. Pakistan should keep off it and talk of matters which are, strictly speaking, matters concerning states of Pakistan and India. It would appear—or, at any rate, it is a plausible hypothesis—that Rao was saying that if anything needed to be changed, it was that line and the unstated part was that, since it cannot be changed, someday it could be at the frontier between India and Pakistan. Nehru must have agreed to the ceasefire line in the hope that it would someday form the basis of a frontier arrangement between India and Pakistan. It does seem to us that Rao might have had that possibility in mind. Whether it is Nawaz Sharief or Benazir Bhutto, Rao must have reckoned, nobody in Pakistan wants to fight liberation wars. We shall divide Kashmir between the two of us or, rather, since it has remained divided between us for so many years, why not treat the matter as closed, Rao seemed to ask.

This, of course, is only a hypothesis. Besides, there is no guarantee that Pakistan would accept the idea even with minor adjustments. What Rao has suggested, if our hypothesis is right, is a good piece of advice. Keep away from the 'liberators' and come close to us; the ceasefire line could be a good starting point.

Nothing will eventually come of it. Indians and Pakistanis do not learn the lessons of history easily. But meanwhile, people such as the present commentator can draw some satisfaction that there might not after all be a war between 'them' and 'us'.

ANDHRA PRADESH

All Kapus as BCs

Reducing Reservation to a Farce

M Shatrugna

In a desperate move to garner support for the forthcoming assembly elections, the Andhra Pradesh chief minister has sidelined the backward classes commission appointed by the Congress(I) government itself and hurriedly issued a government order including all Kapus and all Muslims in the list of backward classes eligible for reservation in the state, thereby reducing the whole system of reservation to a farce and an object of ridicule.

BY announcing the inclusion of Kapus, Muslims and 12 other communities in the list of backward classes, chief minister Kotla Vijaya Bhaskar Reddy has fired the first shot in the electioneering for the ensuing assembly polls. The decision is laced with hypocrisy and political fraud.

Though Articles 15(4) and 16(4) of the Constitution empower the state to give affirmative protection to the backward classes, those eligible are first to be identified. This is normally done by a commission appointed under the Commission of Inquiry Act 1952. The first such commission was appointed in the state in 1968 during the regime of Kasu Brahmananda Reddy. Popularly known as the Anantaraman Committee, its terms of reference included determining (1) the criteria to be adopted to identify the socially and economically backward classes setting out also their approximate numbers and their territorial distribution, (2) reservation of seats in educational institutions maintained by the state, (3) percentage of such reservations, (4) quantum of assistance and period for which the assistance was to be given, and (5) reservation of appointments, percentage of such reservations and the time frame.

But before the Anantaraman Commission could work out the modalities, it had to look into the constitutional provisions on reservations. When the Constitution came into force on January 26, 1950, it did not contain the exception clause (4) in Article 15. There was an order of the Madras government, known as Communal GO No 1254, Education, dated June 17, 1948, regulating admission to the medical and engineering colleges in Madras state on the basis of caste or communities. After the Constitution came into being, the validity (of the order) was questioned in the Madras High Court in the now famous Champakam Dorairajan vs State of Madras case. The high court found that this regulation offended against the fundamental rights guaranteed to citizens by Articles 15(1) and 29(2). The high court, therefore, held that selections made on the basis of the Communal GO were unconstitutional.

The matter was taken in appeal to the Supreme Court and the apex court finally dismissed the appeal (AIR 1951 SC, 266). The dismissal of the appeal led to a wave of protest and agitation in Madras, which made Jawaharlal Nehru take the initiative to look into the reservation issue afresh. Accordingly the government of India felt that some special provision must be made for the educational advancement of the backward classes as the BCs cannot claim benefits under Act 16(4) if they are not educated. Accordingly clause (4) was added to Article (15) conferring such benefits. Incidentally it was the (First Amendment) Act 1951 of the Constitution.

But 15(4) does not define social and educational backwardness. Secondly, doubts were expressed whether 15(4) covered both social and educational backwardness or either one of the two. This was clarified by the Supreme Court in (Balaji vs State of Mysore) wherein it has been observed that " the backwardness under Articles 15(4) must be social and educational. It is not either social or educational but it is both social and educational."

By the time the united Andhra Pradesh was formed on November 1, 1956, the former Andhra state (formed out of the Madras Presidency in 1953) had a BC list of 86 and the former Hyderabad state segment (Telengana) had a list of 60, thus totalling 146 castes. With this background the Anantaraman Commission, after an elaborate exercise, prepared a questionnaire listing the criterion for social and educational backwardness and identified four categories of backward classes with aboriginal tribes, vimukta jathis, nomadic and semi-nomadic tribes covering category A, vocational groups under B, harijan converts under C and D covering other classes. The commission had recommended 30 per cent as BC reservations with 7 per cent under (A), 13 per cent under (B), 1 per cent under (C) and 9 per cent under (D). While A covered 37 castes, B had 21 castes, C had scheduled caste converts into Christianity and D 33 other castes. It is interesting that neither Kapus nor Muslims in general were accepted by the AR Commission as BCs, though a number of representations were made by the Muslim community for favourable consideration. While rejecting the demand that 'all' Muslims should be regarded as BCs, the commission has agreed to include certain sections of Muslims who over the years have been treated as low in social position due to the nature of their profession and educational backwardness. For instance, the Dudekula (Laddaf, Noorbash) section of the Muslims were included in the BC list as "most of this class of Muslims are converts from lower ranks. Their traditional occupation was cotton ginning, making of beds, pillows, etc. They are treated as a separate class even by the Muslims and they are not allowed to inter-marry with the other Muslims. They are looked down low in society, both by the Muslims and Hindus" (AP Report, p 202). The commission had included this section of Muslims in BC list in the 'B' category. The Majlis Ittehadul Muslimeen (MIM) had represented to the commission that all Muslims who were not assessed for income tax (economic criterion) should be treated as BCs. The commission had rightly rejected the demand.

While accepting the report the state government had decided to give 25 per cent reservations to the BCs. The commission further recommended that reservations may be allowed for a period of 10 years subject to revision. After 12 years, in 1982 the state government appointed another commission called the N K Muralidhar Rao commission to review the implementation of the recommendations made by the Anantaraman Commission. Also, for the first time the demand of the minority communities formed a part of the terms of reference.

The Muralidhar Rao (MR) Commission, following the AR Commission guidelines, recommended five categories. While retaining almost the same list in the A and B categories, it shifted SC converts to E category and divided the earlier D group into C (miscellaneous professions) and D (OBCs). The additional list included all the castes listed by the 1970 commission and nine others—Gajula Balija, Quraishi (Muslim butchers), Ayyerukala, Kasi-Kapadi, Kurakula, Nagaralu, Pala Ekar, Patra and Pondara. While rejecting the demand for inclusion of Muslims in the BC categories, it retained the earlier categories, viz, Dudekula and Mehtars, the latter added by a government order. Similarly the demand of the Sikhs was also rejected. The other recommendations included the upward revision of reservations from 25 per cent to

44 per cent (as in the view of the commission, the BCs constituted about 52 per cent of the total population of the state) and reservations for a period of 25 years (one generation), subject to review. As earlier, the Kapu community nowhere figured in the MR report. The MR further found that the reservations had not been fully implemented in a number of departments. For instance, in the AP Agriculture University there were 2 BC professors out of 35, 10 associate professors out of 137, 61 assistant professors out of 688. In the high court (government pleaders, public prosecutors and juniors) and Muftasil courts, only 12 per cent belonged to the BC classes. Economic benefits like subsidised housing was provided to only 17.5 per cent of BCs in 1979, increasing to 18.5 per cent in 1980-81.

The most significant recommendation of the MR Commission was that reservations should be enhanced to 44 per cent.

But in January 1983 the state saw the eclipse of the Congress(I) government headed by Kotla Vijaya Bhaskara Reddy and the coming into power of TDP. With the TDP posing a challenge to Indira Gandhi at the centre politics in the state took a despicable turn with the convening of a BC conference by Shiv Shankar of the HBW-gas pipeline fame. Shiv Shankar, belonging to the Mannuru Kapu community (BC) had never won even a municipal election so far. A legal aide of Indira Gandhi after the Emergency, he was a former judge of the AP High Court. A political manipulator, he was the government counsel in the Justice Bhargava Commission set up by the Janata government to enquire into naxalite killings in Andhra Pradesh. Defeated in the 1984 Lok Sabha polls, he was made a Rajya Sabha member from Gujarat by Indira Gandhi. After having failed to rally the BCs under the Congress(I) in 1986, he unwittingly strengthened the hands of NTR. In the political charade NTR proved to be cleverer. He established himself as the unchallenged champion of the BCs by 'enhancing' BC reservations to 40 per cent. When the state high court struck down the government order, he deliberately refused to go to the apex court. But the MR Commission's main recommendation of 44 per cent reservation for the BCs was never accepted. The old policy of 25 per cent reservations continued.

Though the TDP lost power in the 1989 elections, successive Congress(I) chief ministers did not change the basic policy on reservations, though they criticised NTR on the issue when they were out of power.

Mudragada Padmanabham, a prosperous Kapu leader from East Godavari district, was a Congress MLA in 1978 but switched to the TDP in 1982 to win the assembly seat in the 1983 and 1985 polls. He was a minister between 1985 and 1988 and had resigned from the ministry in 1988, just before the 1988 Kamma-Kapu riots in Krishna district

[illegible] in 1988 of the Kapu and a known 'rowdy-sheeter' of Vijayawada, Vangaveeti Mohan Ranga, Padmanabham was asked to preside over the first major Kapu conference in Vijayawada drawing the attention of his community to his "non-corrupt, clean" image

In the 1989 elections, he contested on the Congress(I) symbol and was elected He was included in the N Janardhan Reddy ministry, but Kotla kept him out Piqued, he vowed to avenge the insult But there was no political issue on which he could fight Kotla The only issue that could confer Kapu leadership on him and indirectly help him fight the fledgling BSP of Kanshi Ram was the BC one In a calculated move he resigned from the assembly, returned to his village and demanded the inclusion of Kapus in the BC category

Kapus are historically attached to land as watchmen, agriculturists and, more recently, big farmers Prosperitywise they are below the Kamma community There are four types of Kapus in Andhra called 'Toorpu (eastern) Kapus' in the north coastal districts of Srikakulam Vijayanagaram and Visakhapatnam, 'Kapus' in the agriculturally prosperous districts of Godavaries, Krishna and Guntur, 'Balijas' in the Rayalaseema districts and 'Munnuru Kapus' in the Telengana districts Toorpu Kapus and Munnuru Kapus are listed BCs The total population of the Kapus is around 12 per cent of which about 5 per cent are listed BCs In other words, if reservations are extended to all Kapus, they form a formidable 12 per cent and tilt the electoral balance significantly Politically they are a strong group As 25 per cent of the population is already listed as BCs for reservations, in the new setting, reservations can go up to 32 per cent for the BC category alone

Initially Kotla pooh-poohed Padmanabham's idea Branding the demand as illegal, unconstitutional and unjustified, he refused to entertain him

Developments outside the state had also indirectly helped Padmanabham Just after the Ayodhya incidents, the Supreme Court in a historic judgment ruled that as there was a lot of confusion about the enumeration of BCs following the Mandal Commission findings, the state governments should appoint their own BC commissions to take stock of the situation afresh Accordingly, the Andhra Pradesh government had created a BC commission through an act of the state legislature and after much search appointed Justice Puttaswamy from Karnataka to head the third BC commission As in the past, many groups and individuals approached the commission to consider their demand for inclusion in the BC list.

Meanwhile, after a shaky start, the Kapu agitation under Padmanabham took a violent turn in June this year leading to police firing Even then Kotla dismissed the Kapus' demand as unconstitutional and untenable But politics of the Congress(I) variety has its own inner logic When Mudragada went on a 'fast unto death' in July, Kotla, who was already facing a challenge to his leadership from YSR, agreed to Mudragada's plea for inclusion of Kapus in the BC category The vigilant Padmanabham called off his fast unto death Then Kotla triumphantly announced that he would request the Puttaswamy Commission to submit its report by August 31 this year with the inclusion of Kapus in the BC list When asked to comment on this, Justice Puttaswamy curtly told the press that "it is impossible to finalise the report by August 31" and added that the commission would follow its own procedure to identify 'new' BCs and follow its own time-frame With time running out Kotla in a swift move called a cabinet meeting on August 23 and informed a stunned cabinet that an additional 14 castes, including Kapus and Muslims, would be added to the 'new' BC list A press note issued after the cabinet meeting gave the details It is worth quoting the note

The list of backward classes now in force is based on the recommendations of the Anantharaman Commission appointed in the year 1968 Subsequently another commission constituted with a single member Sri N K Muralidhar Rao in the year 1982 submitted its report the same year This commission has after a thorough examination of the social and educational backwardness of the various castes and communities recommended the inclusion of nine castes/communities in the list of backward classes However, for various reasons they could not as yet be treated as backward classes

(2) There has been a persistent demand from the aforesaid nine castes recommended by Muralidhar Rao Commission Kapus Balijas Telegas Ontari and Muslims for inclusion in the list of backward classes While the matter stood thus the government of India sought to implement the report of Mandal Commission on Backward Classes and in the resultant litigation the Supreme Court recommended the constitution of a permanent body to examine the complaints of wrong inclusion or non inclusion of groups in the list of backward classes On the directions of the Supreme Court the government of Andhra Pradesh constituted the Andhra Pradesh Commission for Backward Classes (hereinafter in this Order referred to as the Commission) by the Andhra Pradesh Act No 20 of 1993

(3) While the commission was examining the representations from various communities for inclusion in the list of backward classes, there has been considerable unrest among the members of various castes and communities in support of their long pending demand and the government initially extended certain non statutory educational benefits to students of certain castes whose parent's or guardian's income is Rs 12,000 or less per annum Similarly, certain economic support schemes have also been extended to persons whose income is less than Rs 6 000 PA in the orders read above These benefits were subsequently extended to Muslims also

(4) However the mere extension of economic benefits is not adequate and will not entitle these castes for reservation of seats in educational institutions and for the reservation of jobs in government and local bodies, which indeed is their main demand In fact certain castes who are similarly situated are already included in the list of backward classes in certain regions of this state and other neighbouring states In these circumstances, the government made a request to the Commission for an interim report in regard to the social and educational backwardness of these castes and communities But the commission expressed its inability to do so

(5) Normally before any caste or community is included or excluded from the list of backward classes the government is expected to seek a report from the commission and then take appropriate action It is not the policy of the government under normal circumstances to deviate from this procedure But so far as the demand of the castes and communities under reference for inclusion in the list of backward classes is concerned it is a long pending demand with a mass support sometimes even causing unrest for the simple reason that certain communities which are more or less on par with them in the matter of social and educational backwardness have already been included in the list of backward classes Thus a feeling of iniquity has been generated in those communities giving rise to emotional upsurges for social justice

(6) In the above backdrop of events and demands and pending receipt of the report of the commission the government hereby orders that [14 other] castes/communities shall be treated as socially and educationally backward classes of citizens for the purpose of reservation of seats in educational institutions and for recruitment to jobs in government, local bodies etc

(7) Any reservation to the communities hereby ordered to be included in the list of backward classes will not cut into the quantum of reservation available to those who are already recognised as backward classes

(8) The government also hereby orders that separate orders shall issue in respect of the following matters based on the report of the commission namely

(i) the percentage of reservation to be earmarked to the castes and communities included by this order in the list of backward classes, (ii) the group/classification/class in which they should be included (iii) the economic criteria to be applied for the entitlement of the benefits extended to the backward classes under the rules

(9) The inclusion of the castes and communities by this order in the list of backward classes shall not however affect the admission into educational institutions for the academic year 1994 95 or the selection to the services under government local bodies etc, for which the process has already commenced

(10) As the reservations contemplated to the castes and communities included in the list of backward classes by this order are in addition to the quantum of reservations available to castes and communities already included in the list of backward classes, government will take suitable action in order to provide for reservations in excess of 50 per cent

nities for inclusion in the list of backward classes which are now pending before the commission will be examined separately.

The above passage clearly shows that the chief minister sought to pressurise the commission to meet his own political and personal ends. The government logic appears to be in case Puttaswamy refuses to agree to the demand of the government, it would legislate reservations crossing 50 per cent, thus paving the way for the inclusion of enhanced reservations in the Ninth Schedule of the Constitution. The Tamil Nadu example appears to have emboldened the government to go ahead with this political measure to silence not only its detractors within the party but also the challenge of the TDP. The frequent visits of BSP leader Kanshi Ram to seek a foothold in the state also appears to have influenced the government decision. While the opposition parties dubbed the Congress(I) decision as a political fraud, Congress(I) dissident/ageing/out of power BC leaders opposed the move. But some did a volte-face within 24 hours. For instance, K V Kesavulu opposed the move along with a number of other BC leaders initially, but ate humble pie the next day welcoming the government move. Known to be a P V Narasimha Rao follower, it is likely that more dissidents will follow his footsteps showing their allegiance to PV, especially in view of the ensuing elections. While non-Congress(I) BC leader R Krishnayya went to the high court challenging the government order, strangely none of the BC or SC or ST organisations have challenged the government policy in the courts.

Significantly, the BSP which is supposed to speak on behalf of the BCs, SC, ST, Muslims and women has remained silent on the issue. According to a senior BSP leader, 'absorbing' the Kapus in the BC category has meant that one section of the 'upper castes' is 'disarmed'. Surprisingly, apart from the Left parties, only the BJP has taken the position that the commission should be given the power to decide who else should be included in the new list; it also opposed the inclusion of Muslims *en masse* as this would give a 'double-benefit' to the Muslims. Christians have also asked for their community to be included. Thus the entire BC reservation issue has become a comic opera in the state.

Post-script: Admitting a petition challenging the government order in the state high court, Justice Nayak stayed the operation of the GO and asked the government to file a counter. The advocate general laconically requested three weeks' time to file the counter, on the ground that the issue was not that "pressing". This was followed by an announcement of the chief minister in Vijayawada on August 30 that the state government would seek vacation of the stay and would approach the Supreme Court if necessary.

USAID: Aid to US

Malini Bhattacharya

Does the USAID project for providing $ 325 million for family planning in India mean aid to India or aid for American drug transnationals to sell their novel contraceptive devices here?

THE United States Agency for International Development—USAID in short—is the conduit for development aid from the United States to backward countries like India. In July 1992, a new bond was created between India and the United States through an understanding negotiated by this body. The American ruling class, who sincerely consider themselves trustees for global development, are of the opinion that in spite of the up-to-date ignition from the new economic policy the Indian rocket of progress is being constantly pulled down by the weight of population growth. Therefore what this hapless country needs is new technologies and advanced counsel from specialists in the field of family planning. They are worried that poor India may not be able to take advantage of the new technological regime because of financial constraints. The July 1992 project therefore is pumping 325 million American dollars into family planning work; 225 million would be spent on imports as well as indigenous accounts, but 100 million would be earmarked for equipment, formulations and technology obtainable from AID/Washington. This 10-year project would be primarily confined to Uttar Pradesh, one of the most backward states in this regard. It is of course being hoped that in due course this will be the principal model for a national programme.

The 1991 census puts population growth rate at 2.14 per cent slightly lower than the last two decades. But the national goal of lowering the figure to 1.2 appears more and more distant; the plan of reaching the target by 2006-2011 is now being pushed back to the years 2011-2016, and questions are being raised about that too. We must notice that though the mean fertility rate for women has come down from 5.97 in 1951 to 3.9 in 1991, the average rate of population growth has not come down as expected. The reason of course is that population growth does not depend solely on the birth rate. The infant mortality rate has also come down from 146 in a thousand in 1951-61 to 80 in 1981-91. This does not at all prove that family planning projects have failed completely. But the Indian rulers have in the last few years acted on the assumption that the family planning technologies are the sole means of population control—a mindset which fits in beautifully with the USAID regime.

Why has not the family planning programme taken root in India in spite of massive expenditure and prodigious publicity? The coercive sterilisation programme, a brain-child of Sanjay Gandhi, raised such a strong reaction among the people that the authorities have since preached family planning programmes as a completely voluntary measure in this democratic society. The programme is now known as family welfare, and the government department is also similarly named. The nomenclature accepts that an ordinary man will be motivated towards family planning only when he is assured of longevity, health and nutrition of the children and of an improvement in the standard of living as a result. This acknowledgement by the government had resulted in the adoption of programmes like the Integrated Child Development Scheme and the UNICEF-sponsored Universal Immunisation Programme. If these programmes were made equally effective throughout the country and the money utilised to bring all mothers and children under such a welfare net, the close link between family welfare and family planning would be evident. But public health distribution system remains rudimentary in most of the states, while state expenditure on health is declining. It will take the ICDS scheme at least 10 years to cover all blocks even if it goes on at the present rate. The reason is the lack of political will on the part of our rulers. If there are disincentives to family planning, the reason lies in utter poverty, lack of educational opportunities, fear of child mortality and widespread use of child labour. However, these economic and ideological constraints have not prevented the women from poorer sections from demanding more widespread aid in family planning.

To meet this demand what was needed was an extension of welfare programmes and the supply of easy, cheap and safe birth control materials to couples. But our masters in politics and administration appear to be too impatient to stick to customary procedures like the barrier-methods (condom, diaphragm, etc), or even terminal methods like sterilisation and vasectomy. All kinds of novel birth control technologies are now sought to be pushed into family planning programmes—technologies which are not yet sufficiently tested, which may disrupt normal bodily processes through hormonal intervention and which are in any case to be applied under full medical supervision. And these measures are almost wholly targeted on women. Even among customary terminal methods 96 per cent of applications are confined to women's sterilisation. The new experimental methods are largely tested on women who are poor, backward and illiterate. One has the suspicion that the authorities have conveniently chosen the unorganised women of backward sections who would suffer in silence the possible physical and mental damage resulting from such indirect coercion. Among these are new invasive methods like Norplant, Net-N, etc. If now we remember that these methods are the property of the transnational drug corporations of the United States and Germany we will be in a position to unravel the mystery of US generosity. In fact, the controversial Depo Provera has already been pushed into the market apparently without completing the mandatory clinical trials in Indian conditions.

These drug transnationals have always tried to experiment with new technologies in third world countries before their introduction to the west. Depo Provera, which is banned in the US, was sought to be tested in Bangladesh. Norplant is permitted in the US but it is completely unsuitable in a country like India where proper medical supervision is impossible. About two years ago Norplant-2, an earlier version of Norplant, was inserted into 1,200 women from Uttar Pradesh who were all itinerant daily labourers. No one bothered to trace these hapless creatures who had disappeared with these hormone-filled capsules in their body. The then minister, Fotedar, had promised the agitating women's organisations in Delhi that new contraceptive methods would not be included in the family planning programmes till experiments were completed. How could the authorities be sure of the efficacy and safety of the new methods within a year? Is it because they are in a desperate hurry to respond to USAID?

Does the USAID project mean aid to India then? Or is it an aid from India to the American drug transnationals to sell their novel contraceptive devices? We must remember that India has to spend the rupee equivalent of 400 million dollars to match the USAID contribution of 225 millions. The whole of this amount will be spent on the extension, development and publicisation of novel birth control measures. Not a single paisa of this can be spent on family welfare programmes. The experiments will be carried out in remote, backward and poorer localities, not usually under observation. Materials and technologies have to be bought from the United States; the materials, technologies, training programmes and officials employed under the terms of the treaty will be exempted from all Indian taxes. The project will be supervised by an autonomous body, comprised by representatives of the government of India, government of Uttar Pradesh, USAID, voluntary organisations and corporate bodies. This autonomous body will unilaterally, without any reference to the government or the parliament, prepare its budget, assign grants to both government and non-government organisations, enter into contracts and employ as well as dismiss workers. It will also be free to contract out to voluntary organisations the extension of innovative birth control measures. The reason is simple: whatever happens to us, we must pave the way for the drug transnationals in our country.

Muddle of Partial Privatisation of Banks

N P Kurup

The banks which are eager to go to the market to raise capital are mostly those which have already achieved the prescribed capital adequacy ratio. Further, though legislation has been enacted to enable banks to issue shares to the public, many practical difficulties have cropped up.

THE profit-making nationalised banks are very enthusiastic to take the capital market route. Reports indicate that Oriental Bank of Commerce, a small profitable bank, has received sanctions from the RBI and the government for its proposal for share issue. The interesting part of the story is that most of the capital market aspirants have achieved the prescribed capital adequacy ratio of 8 per cent and Canara's ratio stands at an impressive 12.06 per cent. Yet the bank has plans to come out with a public issue as stated in its annual report. The government, which owns these banks, appears to be not that eager for privatisation, though the backseat reformers may be pressing for it. This raises the question as to what are the objectives behind the over-eagerness being shown by banks to take the capital market route.

Before searching for answers to the question, let us look at the steps taken by the government to facilitate partial privatisation. The bank nationalisation acts of 1970 and 1980 did not permit private shareholding. Therefore, the Banking Companies (Acquisition and Transfer of Undertakings) Act 1994 was introduced. In terms of this act, the central government's minimum holding of share capital was reduced to 51 per cent and a maximum of 49 per cent could be raised by public issue of shares which shall be freely transferable. The representation of private shareholders on the boards of directors of the banks has been linked to the extent of private share of holding, 2 directors if private shareholding is not more than 20 per cent, not more than 4 directors for private shareholding between 20 and 40 per cent and not more than 6 directors for private shareholding above 40 per cent. The voting rights of a shareholder has been limited to 1 per cent of the total voting rights of all shareholders including central government.

Though the legislation enables banks to issue shares to the public, many practical difficulties have cropped up. With the infusion of Rs 5,700 crore to the share capital of various banks in January this year, there is a problem of banks having too much equity; a large equity base implies low earnings per share. The government of India's Discussion Paper (December 1993) acknowledged this but observed that "both these problems could be solved by the write-down of government equity against accumulated losses, but this is not permitted under current law". Therefore, the logical course would have been to amend the law, but the law enacted contains no such provisions. Even a provision to adjust government equity against accumulated losses would not help the profit-making banks as they have no losses to be written down. Therefore, these banks are making representation after representation to convert part of their equity into long-term loan which will form part of Tier II capital. In the case of banks like Canara, even if government equity is converted into Tier II capital, the capital adequacy ratio will be very high and, therefore, they want to return the capital already subscribed by the government. The law ministry's view that the existing legislation did not permit reduction in the equity of nationalised banks has put a spoke in the wheel and the banking department is reported to be considering fresh legislation for the purpose. While banks are blaming the government for inadequate legislation, the government and RBI are pointing fingers at the absolute lack of any meaningful information system or planning in the banks. As reported by *Business Standard*, a senior RBI official revealed that one bank chairman first came and asked for Rs 2,000 crore for the recapitalisation of his bank. When the chairman met him next he said that Rs 1,500 crore was enough. At the third meeting the chairman said that he did not want a single paisa more than Rs 1,000 crore. The story of the profit-making banks is not much different. During 1993 every bank was clamouring for a higher share out of the budgetary allocation of Rs 5,700 crore. Now there are few takers for the current year's allocation of Rs 5,600 crore for subscription to the capital of banks.

A victim of banking sector reforms is Punjab National Bank, a well-managed profitable bank which is celebrating its centenary now. As part of the banking sector reform process, New Bank of India, the smallest of the nationalised banks in terms of assets but far above three others in number of employees and with accumulated losses and carry over provisions of about Rs 450 crore was merged with PNB in September 1993. As the NBI was incurring an annual operational loss of about Rs 70 crore, PNB made determined efforts to ensure that it continued to remain at the top of nationalised banks in terms of net profit as also social banking, even after absorbing the operational losses of the branches of the NBI. But the merger scheme, which was perfunctory in character, contained no provisions as to the manner in which the losses of NBI should be adjusted. If the losses are not adjusted against the capital of NBI (Rs 186 crore) and the balance covered by cash payment by government of India as on March 31, 1994, PNB's profit and loss statement cannot escape showing losses, for the first time in its long history and that too in the centenary year. Perhaps, creative accounting may find a way to camouflage the loss. But it is having a terrible demoralising impact on the staff at all levels. Creative efforts or good work does not come from logical reasoning; the much talked about 'commitment' is an emotional phenomenon in which pride in the organisation, pride in oneself, etc, plays a crucial part in the drive towards excellence.

As one who had been campaigning to mould PNB as a profitable and socially responsible bank, it was this writer's experience that the message to staff that 'PNB is the best address for a bank employee' had a wonderful reception touching the heart of every employee, motivating her or him to better performance. But in the bureaucratic world, these emotional aspects of performance of an organisation have little relevance; to them an institution is only a pawn in a bigger game. The government wanted an amalgamation of a weak bank to show the World Bank that India is restructuring the inefficient government-owned banks. In such situations, the chief executives of the organisations have a wider responsibility going beyond complying with the wishes of the government; they have to display qualities of professional leadership of the organisation.

This writer has talked to many executives of a capital market aspirant bank to get an idea about their perception of the objective of taking the capital market route. Though all agreed that attaining capital adequacy is not the real objective, their perception of the real motive varied from executive to executive. One felt that raising capital from the market is now a hallmark of distinction, a distinct identity for the bank from that of nationalised banks as a whole. Another felt that the share premium could add to the reserves of the bank. It was also said that the obligation-free share premium may contribute to the profits of the bank, though its impact will only be marginal for major banks with resources of about Rs 20,000 crore. Perhaps the most important objective behind the enthusiasm for taking the capital market route is that it will facilitate more autonomy for bank management. To some extent, even a small percentage of private shareholding would strengthen the hands of management against political and bureaucratic intervention in the day-to-day affairs of the bank. But autonomy along with responsibility to give results is required equally for other banks. The sooner it is done the better for the banks and the country.

Malaysia: The Unstoppable Tiger?

Frederic F Clairmont

The inevitable corollary of accumulation wedded to liberalisation, privatisation and accelerated integration into the world market is the frenzied drive to capital concentration in Malaysia. The global and domestic reverberations of these cataclysmic changes will, however, be vastly different from what the country's corporate expansionists and their political promoters are hoping for.

MALAYSIA, that resplendent crown jewel of the Raj, was a colony from 1786 to 1957, except for a brief interlude (1942-45) when another imperial predator made a desperate lunge to gouge out its share of the lush colonial pickings. The region's prodigious mining, fisheries, plantations and timber resources are legendary: one of the towering arches in the edifice of Victorian imperialism—and they are all British, as prime minister Benjamin Disraeli (1804-81), a big-time speculator in Peninsular plantation and mining stocks, always gloated. The pillage was shared to a piddling extent with the ideal collaborationist stooges of Empire: the Sultans[1] the counterparts to the princely states of India.

Malaysia, as any perfunctory visitor to its throbbing cities and countryside discerns, is a capitalist nation (19m) on the boil. Its euphoric national mood smacks, at times, of an arrogant triumphalism; in blatant contrast not only to stricken third world regions, but no less so to OECD countries battered by soaring joblessness, the cracking of the Welfare State, disembowelled political structures, swindles, kickbacks and political payola unlimited.

The Wall Street Journal pithily encapsulated this tumultuous breakthrough that still exhibits no traces of deceleration:[2] "Malaysia is flourishing: anyone who wants a job can find one. Exports of semi-conductors and autos are booming. Stores are thronged, suburbs are expanding, and the economy is racing about four times as fast as the OECD growth average." There is much more to the big boom than a barrel of glittering numbers would celebrate. As in Japan, before the political rot surfaced and the speculative bubble exploded, economic growth has become an engine fuelling national, cultural, racial identity and power: a conspicuous trait shared with China and the other Tigers.

'The grand Malaysian transformation', as one major Swiss investor extols, must be visualised also in the grimmer context of interminable crisis: volume of world merchandise exports fell to 2.5 per cent in 1993;[3] world production to 1.7 per cent. Symptomatic of capitalism's highly unequal development is that the business cycle is desynchronised: in the advanced capitalist countries *production* growth has steadily crumbled over the last decade, hitting an all-time low of -0.3 per cent in 1993;[4] in contrast, output growth in Asia has chalked up an annualised rate of 7.5 per cent over the last decade.[5]

Comparative gross saving and investment data portrays the prodigious force powering the Malaysian economy (see the table).

Malaysia is located at the epicentre[6] of one of the most dazzling regional socio-economic upheavals of all time, its metamorphosis into a fully fledged capitalist industrialised economy by 2020—at least that is the grand vision—cannot therefore be abstracted from the exponential burgeoning of Asian capitalism. The implications are immediately apparent: the world balance of industrial and financial power is swiftly shifting towards the east: in 1950, the anaemic Asia-Pacific region had an exiguous 3.5 per cent of world GDP; in 1994, this share will rise to 22; by the century's end, it will have rocketed to about one-third. As for its trajectory into the third millennium that is another drama of Promethean dimensions.

Configuration of Economic Power

Over the last quarter of a century Malaysia's growth has been stunning: between 1970 and 1980, its GDP rose by 8 per cent; by 7 per cent between 1980 and 1993. In this ethnically heterogeneous society where Malays are 52 per cent, Chinese 38 per cent and Indians 10 per cent a powerful manufacturing base financed by private domestic, public sector investments and TNCs has been galvanised. Land pressure is not a problem: population density is one-quarter that of Singapore, a half that of Thailand

Central planning may be dead in the nation that gave it birth (1928-32) but as a politico-institutional force it is very much alive in both Malaysia and Singapore, as a visiting Russian delegation was reminded, in a candid exchange, by a Malaysian academic who lived in Russia. "There is nothing miraculous about what's happening here", he argued. "You're no longer capable of setting yourselves short, medium- and long-term goals. In fact, you've ceased to have the political centralised foundations for growth; and above all the will for doing anything. Look at your currency. It's been debased to a point where it has almost ceased to exist. Your transport system is moribund. As to your social morality it's been dumped into the gutter. These are just some of the things which explain why our living standards are far higher than yours, and the gap between us is growing."

This censorious judgment from one who is himself critical of Kuala Lumpur, pinpoints the psychological tidal change that has swept the national consciousness. The UK, once held up as a model, notably by the Malays, is irrelevant, curtly dismissed oftentimes as a decadent nation. In the idiom of the Cultural Revolution there is much to learn from the UK—by 'negative example'.

There is no contradiction between central planning and the market dynamic as the planners insist. The market left to the anarchic thrust of power and profit is self-destructive. In their view central planning exists to ensure that the market protagonists are guided into more long-range rational decision-making channels. The current development plan ends in 1995, but is part of a far more elaborate blueprint that runs to 2020: the magic alliterative number plastered everywhere.

Over the last decade, the manufacturing sector alone has burgeoned 10 per cent yearly. Indubitably, the fruits of growth and productivity have not been egalitarian. Malaysia is a capitalist society, and a polarised one at that. At least there is no ideological cover-up. To their credit, however, the political elite incarnated in the United Malays National Organisation (UMNO),[7] in conjunction with foreign and domestic capitalists, have generated a full employment society. No mean achievement.

Consumption has climbed markedly; and so have all social indicators This has not, however, been achieved at the expense of agriculture although the urban/rural imbalances still exist. More primordial is the ethnic redistribution of the national cake, achieved by reverse discriminatory measures. The proportion of the Malays' shares in the nation's wealth has risen strikingly, yet, inconceivable without the

Table: Gross Domestic Investment and Savings

Selected Countries	GDI[1] 1970	GDI 1992	GDS[2] 1970	GDS 1992
Singapore	39	41	18	47
Malaysiaa	22	34	27	35
Hong Kong	21	29	25	30
Japan	39	31	40	34
France	27	20	27	21
US	18	16	18	15
UK	20	15	21	14
World	23	22	24	22

Notes: 1 Gross domestic investment. 2 Gross domestic savings.

no less phenomenal growth of the national cake. Redistributive strategies have thus reversed a socially explosive condition prevailing at the time of independence and the ethnic turbulence of 1969. Then Chinese (and to a lesser extent Indian) capital ruled the roost.

Yellow Press: Crime and Punishment

Murdoch and the Tory government did not anticipate Kuala Lumpur's blistering riposte when the ban became law on February 25. It was not in response to the crooked methods of the British government's financing of the Pergau Dam, but aimed against the baseless allegations of Murdoch's flagship, *The Sunday Times*, that bribes were showered on leading politicians, and on Mahatir personally. Precipitously, the anti-third world yellow press joined the bellowing.

The yellow media has always specialised in collecting garbage and dumping it on their victims' heads There was no need for accountability particularly against third world statesmen, 'the lesser breeds', who could not be expected to strike back. But KL did strike back with unimaginable severity Contracts were abrogated, wiping out at a stroke, tens of millions of pounds worth of business.

Given the sheer size of his money bags, Murdoch surmised that he could bash the 'wogs' with impunity The Tories and their yellow press miscalculated They failed to read the nation's pulse. The UMNO machine was vastly consolidated by the electoral victory in Sabah, former British North Borneo [8] Further, Mahatir was supported by all ethnic segments of indigenous capital. To be sure, it was greeted with hallelujahs by the foreign entrepreneurs for whom the ban was manna from heaven

The spurious media charges against Mahatir were the familiar run-of-the-mill filth: he was an authoritarian upstart obsessed with his own rhetoric, a man who never valued a free press, etc. Such sanctimonious baloney coming from corporate capital to whom the press is one commodity like any other: bought, sold and trafficked is the foulest of hypocrisies. For the UK, the confrontation proved devastating

No doubt in the fullness of time the ravages of the dispute will be mitigated but it will never be the same again. *The Far Eastern Economic Review* has got it right: "Things may be patched up, but the relationship has been soured and irreparably so. Crucial is that this is a marking point or rather a turning point in the relations of both countries."9

British racist arrogance towards colonial and ex-colonial peoples has not changed. In his celebrated manifesto to *The Financial Times*, Mahatir struck a vital chord: "the press is not elected".[10] Certainly not the corporate media.

"Press freedom is about telling the truth, not fabricating lies for whatever purposes. The contempt for the hurt inflicted on others seems to be condoned by the British government. The standard answer to Malaysia is that the British press is free. 'Lies, damned lies are free'. Redress is not... If this is not moral decadence then what is?"

Turning the knife in the wound Mahatir went on: "Of course the natives are corrupt. They must be because they are not British and not white. To allege that the Malaysian prime minister accepted bribes is second nature. He should accept the allegation because all politicians in Asia are corrupt. If this is so the question is: why do the British insist on corrupting 'corrupt' politicians? Don't they have any scruples, or do they consider giving bribes is not corruption?"

As he said in his summing up "The die is cast. No contracts in exchange for British press freedom to tell lies." When the ban became law the British press whined that politics and business should not mix, as though the two were ever separable. Did the yellow press ever object when the US, and the UK savagely slammed embargoes on third world countries for 'political' reasons?

The bang would boomerang, vociferated the yellow press: Malaysians would have to pay more for the non-availability of British goods and services. In short, the UK was indispensable. Another myth would be shattered. Like the Bourbons, the British ruling class and their ventriloquist dummies have learnt nothing and forgotten nothing.

British arms deals were scrubbed. The Russians sold 28 Mig-29s ($ 385m) at knock down prices including spare parts, training and other marketing allurements. With more to come. Payments would be made in primary commodities and manufactures. Britain's competitors jumped into the ring: Japan, China, Sweden, France, etc. The KL airport, one of the world's biggest infrastructure projects, in which British construction companies and banks were slated to play a big role, will henceforth be bankrolled, in large measure, by Japanese and Korean soft loans and grants. Markets once deemed eternal are lost.

Strategy of Industrialisation

The all-out offensive to industrialise and export gathered momentum in the 1970s, has its own national logic, but one that bears similarities to the other Tigers. While Malaysia officially does not acknowledge a 'model' as such it nonetheless exists. Whether it be in caning for white collar [illegible] or the vociferous campaigns to maintain clean public toilets, or in its trenchant rejection of *laissez-faire* policies, the model is Singapore.

'Look and learn from Singapore' is the *mot d'ordre* that breaks with the nostrum that West is Best. Central planning is a battering ram. The public sector is to be deployed for breaking into strategic sectors with long gestation periods before profitability emerges.

Manufacturing contributes a third of GDP and employs a quarter of the workforce, up from 15 per cent 10 years ago. Manufactured exports are 70 per cent of aggregate export receipts, expected to rise to 76 per cent in 1998.[11] Nonetheless, it continues to be a powerful primary commodity producer: rubber, timber, tin and palm oil, the world's largest producer.

Production and marketing of Proton, Malaya's national car, symbolises the rhythm of the industrial machine. A joint venture in which Mitsubishi has a minority stake (17 per cent) with the rest held by the public sector. Financing is assured by domestic investors and private Malaysian banks. Proton's domestic content of 70 per cent will rise to 78 per cent by 1998. Around 1,20,000 are produced yearly. By end 1994, the number will be boosted to 1,50,000. These rosy numbers obviously cannot dissimulate the antagonistic forces within Malaysian capitalism.

Japan fears, with justification, that boosting the national auto industry will erode its markets, which is speeding down the familiar South Korean highway. This explains Mitsubishi's reluctance to transfer technology, but any intransigence here spells big trouble. One that goes beyond Porton.[12]

Tokyo knows that this is no bluff The core problem is that if Mitsubishi does not allow Proton to design and produce its own engine and transmission parts it could turn to other Japanese firms; and elsewhere. Malaysia is therefore exploiting, victoriously so far, the imperial conflicts inherent in the world's major triadic blocs: Japan, the EU and the US. Is it surprising that overtures have been made to Peugeot and Citroen amongst others?

Proton's growth is built on a protected internal market, and a small one at that. As in South Korea, a saturation point is rapidly approaching. It is most unlikely that the Wira, Proton's new model, will boost sales appreciably. Continued growth is predicated on breaking into foreign markets. And here, as a Mitsubishi Motors' executive comments, it will be battling with the big sharks. KL remains nonetheless bent on expanding the sector.[13] Whether the gamble will pay off will soon be seen.

Another major car project, this time with

Japan's Daihatsu is slated to come on stream, adding to productive capacity. And that is not all. Can this be sustained? Already the US takes one-fifth of the nation's total exports and an even higher share of its manufactured exports. This underscores the vulnerability of its international marketing strategy. In this kind of conjuncture not only Uncle Sam, but the triadic bloc as a whole has the capacity to put the squeeze on KL's expansionist ardour.

The passage from a colonial primary commodity exporter to a major manufacturing power is apparent on the drive from Penang's international airport to George Town, the state's capital, familiarly known as Silicon island on the peninsula's NE coast. A manufacturing colossus employing a workforce outstripping 2,20,000, the world's largest exporter of semiconductors

A sector ruled by the world's giants: Texas Instruments, Hitachi, Intel, Motorola, Thomson, Seagate, Hewlett-Packard, Taiwan's Acer Inc, etc. This phalanx depicts the extent to which the sector has been rocketed into the TNC orbit and hence ceases to be an autonomous actor. There are critics who contend that this is an irreversible process. Such a thesis, however, appears in my view untenable.

Restructuring the international division of labour means, as in Singapore and South Korea, switching into hi-tech products and not simply assembling components. That cannot be achieved in the short run without research foundations. The problem is however soluble through regional co-operation, notably with Singapore. The central issue faced by Malaysian planners is: what is the feasibility of removing the clutches of TNC capital? Can the TNCs be expected to accept changes in the structure of ownership anathema to their profitability when unit labour costs are considerably cheaper in Vietnam and China, Indonesia and India?[14]

Let us see how Silicon Island is fixed into the TNC mould: Seagate, one of the world's biggest producers of computer hard disks, has 17 plants scatterd around the globe. It produces basic components for hard disks in Northern Ireland and the US, airlifts them to Penang for assembly; sends them to Thailand for further processing, and then to Singapore for final assembly. Malaysia lured the majors in the 1970s by the familiar stratagems of massive tax-breaks and other inducements. Emulated by others.

The industry is buttressed by an incomparable infrastructure and ancillary services. But the bill of the TNC electronics industry to the national economy must be measured by imports; and that is huge: the single largest import item is electronics components parts engulfing one-third of total imports for intermediate goods, and around 14 per cent of total imports. Revelatory is that these imports are three-quarters of the value of electronics exports.

Matsushita Television in Malaysia is the main producer of TVs exported the world over. It accounts for more than three per cent of the nation's GDP. Every morning, its thousands of workers don their Japanese uniforms and sing the company song in Malay, celebrating the start of another day to the greater glory of Matsushita.[15] Exports to the US are denoted as Malaysian and not Japanese. What the strategic ramifications of the electronics industry illuminates is that the TNC research, production, technology transfer and marketing networks effectively control the industry.

This configuration is not, however, as bleak as certain critics contend. What cannot be ignored (and this also holds for the Tigers) is the enormous reservoir of public and private savings. Gross capital flows pouring into Malaysia give a distorted picture. The bulk are speculative short-term flows in quest of high interest rates.

More analytically significant is the breakdown of officially approved manufacturing investments. In 1994, these are expected to be M$ 21 bn as against M$ 8.6 bn in 1993. Only two-fifths of these funds are of foreign provenance. Most are destined for joint ventures. What these relative numbers suggest is that the nation is rigorously selective as to whom it does and does not accept as manufacturing investors. How many countries—let us omit the third world—have the capacity to exercise such discriminatory choice?

Emergence of Malaysian Bourgeoisie

The new Malaysian capitalist order is rooted in two interrelated segments of capital: foreign and domestic. The first, comprises the TNCs and Chinese capital from the Diaspora. The second is national: public and private. The conflicts between them for larger slices of the national market are already manifest.

Foreign capital's rapacity—after all its power and profits[16] were exhibited over the last 150 years—is not lost on the national leadership which, while momentarily an ally of big capital, has a dynamic of its own. The economy is not exempt from the forces of uninhibited concentration, the salient trend of global corporate capital over the last four decades.

The ruling elite have placed their bets: since there's no capitalism without capitalists, to smash into the world market, their capitalists must be big. As a technocrat in the finance ministry proclaims with a Darwinian accent: "To beat the competition you've got to join and fight the Big Boys internationally, and make sure you get bigger and bigger all the time. That's the road we're on. We intend to stay there." Nothing specifically Malaysian about this: such stratagems are embodied in the hegemonic goals of the Tigers and of course China.

Strategy has therefore been blueprinted to generate a mighty national bourgeoisie whose core would consist of about six mega TNCs buttressed by all the financial inducements of the regime and imbricated with UMNO's political strategies. This design ensures that the Bumiputras[17] retain a sizeable chunk in the kingdom of Malaysian finance capital. The following profiles suggest that national policy is well on course.

The Profiles

Sime Darby typifies the thrust to transnationalisation. The firm began its life in the Victorian world as a British plantation corporation. At present, this multi-billion dollar wholly owned Malaysian TNC (in which the State acquired important stakes in 1979) is enormous: over 200 companies in 21 countries, a workforce of 50,000, assets of about 5 per cent of GDP, bigger than Singapore Air Lines. China and Vietnam now are major recipients of its expanding ventures and capital exports.

A conglomerate powerhouse par excellence whose chairman, a Bumi, is Nik Mohamed Yaacob (44). Its tentacles extend from all plantation commodities to petrochemicals, petroleum refining and exploration, certain major manufacturing sectors and services comprising banking and insurance, hotels and tourism, real estate and trading.

Tajudin Ramli, a Bumi corporate tycoon, began his career in bicycles when he purchased a controlling stake in the British Raleigh group. Since then his assets at home and abroad have sprouted astronomically. His conglomerate conquests extend well beyond his central focus: telecommunica-tions and transport. His Technology Resources Corporation already grips two-thirds of Malaysia's booming cellular communications market. His corporate tentacles already extend into every country of SE Asia and China.

Since Malaysian Airlines was put on the privatisation auction block he has acquired a 33 per cent stake. That is not enough. He is after the whole hog. He is the super-expansionist prototype of Malaysia's finance capitalism. Ethnically, he is part of a self-reinforcing coterie of Malay corporate bosses known as 'the Daim boys', after Daim Zainuddin ex-finance minister, and now one of the nation's biggest money-

men. The triumphs of the 'Daims boys' stems not only from their business savvy but also from proximity to political power.[18]

The Chinese-Malaysian group, *Rimbunan Jijau*, one of the world's biggest timber corporations (like the family-owned US Weyerhauser Corporation) is owned by Tiong Hiew King, the dynasty's head. Sarawak accounts for four-fifths of the world's unprocessed log exports. Its operations already extend to all the major Asian producing countries such as the Solomon Islands. The group has now pushed its operations into North America and North China; plans are afoot to move into Siberia and Latin America.

The dynasty's timber concessions in Sarawak alone outstrip 9,00,000 hectares, over 10 times the size of Singapore. As with Sime Darby, its conglomerate holdings straddle a vast array of plantations and manufacturing. It is already one of the world's biggest plywood producers, a major pulp and paper producer; one of the nation's biggest publishers and proprietor of the largest selling Chinese newspaper.

In services, its stakes are high and climbing: real estate, banking, insurance and shipping. Soon we will know whether it succeeds in grabbing the Berjaya Group, one of the biggest manufacturing and textile concerns. It is at times extremely difficult to differentiate between Chinese Diaspora capital and Chinese-Malaysian capital. Obviously the line is blurred. As the trade and capital flows within Asia intensify it will be impossible to disentangle them.

Malaysia United Industries owned by Khoo Kay Peng bought out Murdoch's 15 per cent stake in the *South China Morning Post*, one of HK's biggest newspapers. If to this is added another Chinese-Malaysian financier Robert Kuok's 35 per cent stake that brings Malaysia's control to 55 per cent.

Concluding Reflections

There is nothing that can halt this frenzied drive to capital concentration: the ineluctable corollary of accumulation wedded to liberalisation, privatisation and accelerated integration into the world market. The upshot is that Malaysia's financial and manufacturing structures will become even more massively concentrated by 2000, with striking similarities to the Chaebols in South Korea.[19] That is precisely what the power elite is battling to achieve. The global and domestic reverberations of these cataclysmic changes will, however, be vastly different from the dreamland of its corporate expansionists and their political promoters.

Notes

1 The nine sultans chose from their numbers, every five years, a king. The monarchy has been stripped of its immunity from criminal prosecution. Attempts in 1983 to curb the monarchy's power generated a constitutional crisis. The 1994 constitutional amendments have put an end to its ability to delay legislation.

10 *The Financial Times*, March 17, 1994.

11 East Asian economies are the most export-oriented in the world, measured by the size of their exports relative to GDP. For Malaysia it is 78 per cent, Taiwan 40 per cent, Thailand 36 per cent and South Korea 25 per cent. The world's record is held by Singapore: 175 per cent.

12 The discriminatory practices of Japan Inc are of a quasi-colonial nature of which failure to promote nationals to higher positions of managerial responsibility is but one. Further, Japanese firms have always retained rigorous control over their local subsidiaries, and seldom opt for overseas stock market listings. Hence the claims of the politico-money elite that they have been hindered from purchasing shares in highly profitable domestic firms owned by Japanese.

13 A leading UK vehicle manufacturer has concluded a joint-venture deal to build buses for the domestic and export markets.

14 With more jobs than workers wages are rising fast. What is helping to keep the lid on wages is the 4,00,000 legal immigrant workers and the more than 3,00,000 illegals. When hunted down and caught the latter will be deported. The government has opposed strenuously the linkage of labour standards to trade issues under a new world trading regime. "Our sole advantage", stresses Mahatir, "is our lower costs of labour... there has been talk of levelling the playing field by removing the labour costs advantage we have. But a level playing field is meaningless for midgets competing against giants", *The Financial Times*, April 6, 1994.

Clamp Down on Press in Indonesia

S P Seth

The protests against the banning of three news magazines recently is a reflection of the growing aspirations of Indonesia's new middle class for greater freedom and civil rights.

DESPITE criticism in influential international quarters (the US, for instance) of Jakarta's action in banning some lively news magazines, the Suharto regime is unrelenting. It brutally suppressed a demonstration by a sizeable group of journalists, university lecturers and students against the banning of the magazines *Tempo*, *DeTIK* and *Editor*. The closure of these publications (in June) has put back the process of gradual opening of the country's political system. The crackdown is meant to serve as a warning that the government is determined to maintain the hard line on press freedom.

The official justification for banning the news magazines is that it was necessary to maintain national stability. They were allegedly 'disrupting stability' by investigating and reporting differences between the military and Bachruddin Jusuf Habibie, minister for research and technology, over the purchase and the refurbishing at additional cost of 37 old East German warships (considered rusty buckets by some) which Indonesia had contracted to buy from Germany. Habibie was said to be meeting resistance from the military. Habibie is a close personal friend of president Suharto and has his support. By banning the news magazines in question, Suharto was not only signalling his support for Habibie but clearly warning the press that they must respect official guidelines over the limits of press freedom. He had earlier (before the ban) warned that if this kind of "muddling the situation...to the point of disrupting stability" did not stop, "we will take firm action". He was as good as his word when the government banned the three 'offending' magazines for not heeding his prior warning.

It is hard to believe that a debate over the purchase of defence equipment would be seen by president Suharto as threatening Indonesia's national stability. If Indonesia's stability is so fragile even after over a quarter century of Suharto rule, there is something seriously wrong with the system. There was some hope that the system was gradually opening up. But such optimism was obviously premature. As the *Jakarta Post* commented: "It never crossed our mind that, right in the middle of the newly found climate of openness, the government would go as far as to ban these three publications."

Even though president Suharto is still effectively in charge of his country, there are serious rumblings in Indonesia's body politic. The Indonesian army, which still plays a major political role in the country (and is likely to continue doing so even after Suharto) has started to distance itself from some of president Suharto's actions. It has, for instance, not come out in support of the decision to ban the three magazines. It is unhappy over Habibie's role as the head of Indonesia's military-industrial complex, thus depriving the military brass of important decision-making and lucrative commissions in its own backyard. Habibie's empire is spanning such crucial and lucrative defence industries as developing and building planes, ships, telecommunications, electronics, weapons, etc. It is, therefore, not surprising that he is despised by powerful elements in the military. And because he has president's support, this (among other things like the military's unease over the business activities of Suharto's family) becomes an additional point of tension between Suharto and the military. There is no suggestion here that the president and the Indonesian army are on a collision course. But it is not a happy co-existence. The army might not take it kindly if president Suharto were to consider another five-year term, after the current one ends in 1998 when he would be 76.

In the last over 25 years (after the failure of the communist coup of 1965), Indonesia has made good economic progress in a stable political environment. But this has also meant the growth of the Indonesian middle class keen to have a role in the country's polity. The growing disparity between the country's rich and poor is also a cause for serious concern. Labour disquiet is on the rise, as they seek a better deal for themselves. The growing urbanisation, with its attendant squalor and widespread dissatisfaction, is another ominous sign. Corruption is rife, and the growing prosperity of the president's family seems to symbolise it all in the eyes of people. Students are restive. Riots and demonstrations, involving different strata and sections of society, are not uncommon. The demonstration against media clampdown right in the heart of Jakarta, and its brutal suppression, is probably a sign of things to come.

All because the political system tends to deny legal channels of political participation and/or dissent. All sorts of tensions (political, economic, social and ethnic—the last directed against the country's prosperous Chinese minority believed to be in league with the Suharto family's economic ventures) are, therefore, building up. Unless something is done soon to open up the system and broaden its base of political participation, Indonesia might be in for tumultuous change in time to come.

Immigrant Groups as a Factor in Communal Riots

Zainab Banu

The phenomenon of migration, both temporary and permanent and the presence of migrants in the receiving societies are factors which must be included in any analysis of communalism and communal conflict in modern times.

IT has been a fashion with the political scientists to discuss at public forums, platforms, seminars and the press the havoc perpetrated by communal tensions. Much has been written on communal riots and increasing rate of violence. The antagonism, historical or political, which is found among multi-ethnic groups in a region or in a village have been discussed at length by political scientists. What is worse is that the phenomenon of migration, both temporary and permanent, and the presence of migrants in the receiving societies have not been discussed within the perspective of communalism. It is this focus which is central to the present enquiry. At the outset it must be observed that we dare not consider the settlement of migrants at the place of destination as the only cause of creating communal tensions.

There is an interesting case of Surat which witnessed large-scale communal riots following the demolition of Babri masjid and the Bombay blasts. Jan Breman, who happened to have carried out intensive field work in the district of Surat in 1985, gives his observations on what he calls an anti-Muslim pogrom in Surat ('Anti-Muslim Pogrom in Surat', *Economic and Political Weekly*, April 17, 1993). Breman, while analysing the orgy of violence which broke out in Surat, observes:

> Surat is basically one big transit camp of labour coming in and going off again. The place is swamped with a floating mass which remains outside the law and beyond the benign reach of state agencies. These foot-loose proletarians are subject to repression and exploitation in a capitalist framework remarkable for its nakedness and rawness. The transients are reduced to a passing labour commodity in a cycle of attraction and rejection, condemned to a life which is inhuman by any definition.

Breman argues that the population of Surat within a period of barely 25 years has grown from less than 5,00,000 in 1971 to nearly 17,00,000 inhabitants at the beginning of 1993. The agglomeration has become one big industrial work place characterised by highly varied pattern of small-scale enterprises. Most migrants are temporary and underpaid hands, constantly rotating along the enterprises in their sector of employment. These men are hired and fired according to the needs of their industrial bosses until they are worn out. It is this immigrant labour situation of Surat which is largely responsible for creating violence among Hindus and Muslims. Jan Breman has very rigorously employed the perspective of immigration in explaining the recent orgy of violence which took place in Surat. This is a political explanation of migration in terms of communal riots.

There is yet another dimension of migration. There is migration of entrepreneurs to a less developed community. These entrepreneurs do not belong to the receiving society, but because of their enterprises emerge as decision-makers of the host society. This brings them into cut-throat competition with members of the receiving society. As the labour force working in industrial society is labelled 'outside' it does not hesitate to settle its scores with the local community by committing violence. The immigrant entrepreneurs in the receiving less developed community create situations of violence between two or more groups. In both the cases, immigrant labour force and the immigrant entrepreneurs, the emergence of violence is a possibility, sometimes leading to communal riots.

Communal Perspective of Migration

There was a time in our country more particularly in erstwhile Rajputana, when people died at the same place where they were born. Their life survived at the place of origin right from cradle to grave. With the increasing facilities of transport and communication there has been much movement of population from one place to another.

Generally, the disciplines of history and political science study communalism. Recently communalism has become a sub-speciality of sociology also. It is because of the bias of discipline that historians and political scientists have not studied migration from their own perspectives. However, when social scientists study migration, they have an orientation of their own discipline. Recently those who have tried to attempt a general theory of migration have taken orientation of their own discipline. This has become one of the weaknesses of the building up of a general theory of migration. A perusal of the phenomenon indicates why this weakness has crept in. Migration is a demographic problem; a majority of shifts in population are due to economic imbalances between areas. It may also be a political problem; this is particularly so in international migration where restrictions and conditions apply to those wishing to cross political boundaries. It involves social psychology insofar as the migrant is involved in a proces of decision-making before moving and that his or her personality may play an important role in the success with which he or she integrates with the host society. It is also a sociological problem since the social structure and cultural system both of places of origin and of destination are affected by migration and intention effect of the migrants.

In our country, the study of communal violence has taken place within historical and political perspectives. The migration perspective has all through the period of history remained unexploited. There has not been much international migration in the country. Borders were changed at the time of the division of the country in 1947. The exodus of populations from both the countries—India and Pakistan—was terrible. There was unprecedented bloodshed. The whole episode was unhistorical. It was for the first time that communalism was viewed in terms of mass scale migration. But this was short-lived.

During the last few decades the rate of urbanisation has increased substantially. Surely, there is a tremendous movement of population from one place to another. V S Naipaul who is not charitable to India and the Indian people, however, makes a very interesting observation about the accelerated rate of migration to Bombay. He observes:

> It is said that every day 1,500 and more people, about 1,350 families arrive in Bombay to live. They come mainly from the countryside and they have very little; and in Bombay there is no room for them. There is hardly room for the people already there. The older apartment blocks are full; the new skyscrapers are full; the small, low huts of the squatters settlement on the airport road are packed tightly together. Bombay shows its overcrowding (*India: A Wounded Civilisation*, Penguin Books, 1979, p 57).

If communal violence in India is to be studied scientifically it is essential that in the post-modern period when there has been acceleration of urbanisation and industrialisation, we should fruitfully employ the perspective of migration.

Miron Weiner has attempted to analyse social violence particularly communalism with reference to multi-ethnicity syndrome. There are actually two situations when the immigrants reside in the host society. First the immigrants try to emphasise their ethnic identification. Secondly, they accept the industrial ethic. Weiner argues that in a low income multi-ethnic society which we call less developed society, the process of modernisation includes two processes which are often antagonistic. First, it provides opportunities for mobility and thus encourages internal migration. Secondly, it helps the development of "ethnic cohesion". To quote his words:

> The one encourages movement of individuals across cultural, linguistic and ethnic regions, thereby changing the mix of ethnic group within a given space... the *other often generates anti-migrant sentiments among the local people* (emphasis mine) (*Sons of the Soil: Migration and Ethnic Conflict in India*, Princeton University Press, p 178).

Weiner has brought out two basic factors in the process of migration. For the migrants and also for the members of receiving society, the local resources are limited. As a result, the effectiveness of ethnic identification and ethnic cohesion play an important role. Each group of immigrants and the group of locals come in competition to corner as much benefits as possible. A kind of antagonism ensues between the two groups which more than often ends up in communal violence.

Communalism has been recently analysed not from the class bias but with the perspective of ethnicity. Giving explanation for this, Deniel Bell[1] argues that ethnicity has become more salient than class because it can combine an interest with an effective tie. To Bell, it has become more salient because of the institutionalisation of class interest and the centrality of political arena. In a comment on constitution making and minority problem A D Pant and U K Tiwari observe:

> In a multi-ethnic society where class cuts across ethnic lines and ethnicity cuts across class lines ethnic issues prevail over class issues and ethnic tie becomes more effective.[2]

Quite like Pant and Tiwari, Weiner has also argued that when there is a closefit between the class division and ethnic division and conflicts generally take an ethnic character that often transcends whatever class differences exist within each of the ethnic groups. The fact of the matter is that on the one hand the immigrants carry their ethnic attributes with them while going to the host society; on the other, they are free to undergo the processes of political modernisation. At the receiving society they have all the rights *vis-a-vis* the right of the local people as a result of political modernisation. The process of the 'fit' between ethnicity and class gets complicated when it is charged with political modernisation.

Yogender Singh in his essays on modernisation, argues:

> There is differential rate of economic growth in various regions. This has a definite impact upon the process of political modernisation.
>
> In fact, he argues that when the primordial ethnic groups lose at the hand of ethnic immigrants, the situation gets worsened. His sociological studies have shown that actual deprivation, economic or social, does not matter as much in people's evaluation of the betterment of their life chances as does their *perception* or *evaluation* of deprivation. Education, political mobilisation, and communication may be such important variables. In this respect communication holds an important position. If the rate of economic growth in a region is slow but the communication multipliers is high, there may develop radical political movements, depending upon a suitable combination of other variables.[3]

Though Yogender Singh has not made it explicit, it is certain that communication at the local level, and specially when there is much of inequality among the weaker and minority groups, the chances of violence increase. Political modernisation has equipped the immigrants, and particular entrepreneur immigrant, with the ideology of political consensus based on political individualism or citizenship role.

When an active process of political modernisation after independence was needed, there came the ideological legacy of socialist and democratic liberalism which envisaged a transformed social structure for India, based on economic and social equality, freedom, secularism and social justice. Yogender Singh observes:

> In a society which was mainly rural, ridden by caste, tribal and regional loyalties, this was an uphill task, but the objective was set, to be realised through economic planning. The three major sectors to be mobilised for this purpose were *human*, *industrial* and *agricultural* for human development and educational policy was adopted by most states aimed at the abolition of illiteracy and widening of educational opportunities. Industrial policy resolution formulated a controlled mixed economy and agricultural improvements were sought to be realised in two stages: first, through the abolition of vested interest in the rural social structure through land reforms and secondly, through the Community Development Programme and Panchayati Raj.[4]

The political mobilisation which came into operation from the 1950s and the present globalisation or liberalisation of economy encouraged the movements of entrepreneurs from one place to another. The marwaris, who migrated to Assam and parts of West Bengal and Maharashtra, exercised their hegemony over the local population. With immigration began a sharing in the local power. Thus immigration resulted in the struggle for power which sometimes ended up in communal riots.

Problem of Integration

The sociologists who study migration have a distinct perspective. Their problem is basically the problem of integration of the immigrants in the receiving society. For them, the social structure and cultural system of both the places of origin and destination are affected by migration. Their perspective, therefore, centres round ethnicity and ethnic interactions and, finally, integration of the immigrants. Where they stop the political scientists take over and aruge that integration, mainly ethnic, is not end in itself. What is interesting for them, i e, immigrants, is to corner as much power as possible. Power is always a bone of contention. Those who wield power rule the region. It is with this perspective of power in mind that we should look at the problem of immigration. The problem of immigration, for political scientists, basically involves ethnicity and power.

Any discussion on immigrants should consciously discuss the consequences of lack of cohesion. No society, not even that which does not have immigrants, is fully integrated. Society has a tendency to develop factions working round vested interests. When the immigrants enter the receiving society, they are required to go through a process of resocialisation. The norms, values, and the rituals of the receiving society are expected to be re-learnt by the immigrants. If there remains a widening gap between the norms and values of the immigrants and the receiving society, there would be tensions. And this might lead to violence between the migrants and the local people.

Of all the aspects of immigrants, that of their integration has probably been given the most attention by political scientists. Eisensladel rightly observed that this is resocialisation of the immigrants (*The Absorption of Immigrants*, London, 1954, p 5). It is appropriate here to mention Eisensladel's discussion of indices of full observance. These are three-fold: one, acculturation, that is the learning of a number of new roles, norms and customs of behaviour; two, personal adjustment, so that there are few or no indices of personal disorganisation like suicide, delinquencies, crime, mental illness; and three, institutional dispersion, that is immigrants are not concentrated in one sector of the economic, political, ecological or cultural spheres, and hence cease to have a separate identity. It is the third index which is important for our present enquiry. The situation is quite clear. When the immigrants come to the host society and begin to assume the role of a dominant group in one of the spheres of community's life, there is every possibility of this dominant immigrants group coming into conflict with the local groups. Here lies the rub. If the process of integration becomes a little slow or disoriented, in the long run the result would be communal violence.

There is possibility of communal violence when the frequency of migration to a multi-ethnic society is accelerated. Our Constitution allows the existence of multi-ethnicities. The Indian society which is envisaged in our Constitution is a plural society. On the one hand, the Constitution encourages and protects the identity of each ethnic group, on the other it obliges all the multi-ethnicities to fall into the regional and national mainstream. The multi-ethnic situation has an in-built possibility of communal violence. If in a situation of migration, each immigrant group struggled hard to maintain its identity, exercises its ethnic rights, it may come into conflict with the local ethnic groups. It requires a long process of acculturation and integration in a situation of immigration.

The communal violence which took place after the demolition of Babri masjid in Ayodhya and the Bombay blasts is the result of the weaknesses of the process of integration. All the multi-ethnicities which were in conflict had forgotten the national mainstream which consisted of democracy, socialism, secularism and rationality.

What we have been arguing in the present enquiry is that the incidence of communal violence or the violence involving different segments of society is neither only historical nor is it wholly political. The basis of violence in terms of long-term explanation lies in the ethnicity of the people. The ethnic groups instead of making a composite culture make alliances with different vested interest groups and mobilise people to get as much share in power as possible. In the absence of immigration, the local population is guided by the historical forces with which the community has survived. But when the immigrants come, new combinations of relations are made and this creates ethnic and power elite conflicts. It would, therefore, be fruitful if, first we look at the conceptual framework of ethnicity, and then relate it to the power politics which in the long run results in violence.

Competitive Ethnic Groups

In the present situation of international and inner migration no society is monolith in its ethnic structure. With the increase in migration, varying ethnicities fall into different groups. The ethnic groups in a plural society may differ from one another in their respective numerical strengths, political orientation, socio-economic affiliations, influence in national affairs and communal solidarity. Relations between ethnic groups may vary from being harmonious and complementary to being tense and opprobrious. Take the case of India's villages. Till quite recently, life in our villages was more or less harmonious. Village unity has characterised India's past. It was never heard that village ever had communal riots. Premchand, the well-known Hindi novelist in the story *Panch Parmeshwar*, very clearly indicates the friendly relations between Aligu Chowdhry, a Hindu and Juman Sheikh, a Muslim. With improvements in the fields of transport, communication, and above all migration, the incidence of violence has also made its entry in the villages. As a matter of fact, inter-group relations acquire a problematic character when they are marked by persisting distrust, tension, disharmony and conflict. In their problematic form, they divide a plural society vertically.

The problem of ethnic tensions is the problem appropriate to inter-group relations. P N Rastogi who has critically examined the ethno-social conflict in Indian society argues that communal riots and violence are, in fact, ethnic riots and violence. He says that ethnic tensions are:

> engendered through perceived grievances, deprivation and non-reciprocated expectat-ions of the ethnic communities toward one another. This perception is usually associated with feelings of distrust, political insecurity economics, antagonism and a threat to cultura identity. Such perceptions and feelings hav their basis in the social, political, economic an cultural interests and aspirations of th concerned com-munities. Some of th communal interests and aspirations may deriv from the community's heritage of history. Th psycho-social schism emerging in this manne lead the concerned groups toward intrusiv assertions of their respective ethnic difference Emphasis on ethnic separatism and implici chauvinism leads to persistent aggravation o inter-communal tensions (*Ethnic Tensions i Indian Society*, Milap Publications, Delhi, p 2.

Ethnic conflict is not particular to Indi only. It is worldwide phenomenon. Recently Paul Brass a political scientist from th University of Washington has come ou with a theory of ethnicity and nationalism He dwells on inter-ethnic conflicts an secessionist movements found mainly i erstwhile Soviet Russia and India. He argue that ethnicity has today become a recours

for political identity. In present world situation it has become fashionable for social scientists to explain complex phenomena with the perspective of ethnicity Ethnicity is, in fact, a cultural phenomenon It is defined as a collectivity of people of a distinct nature in terms of race, descent, and culture Thus, an ethnic group is a social collectivity having certain share history and certain common attributes such as race, tribe, language, religion, dress and diet, etc Ethnicity is not a static or pre-ordained category It is a manifestation of the common economic, political, social and cultural interests and their protection by certain members in a plural society What is important for an ethnic community is to keep its culture distinct

The structure of ethnicity is not rigid, it keeps on changing Paul Brass emphasises the dynamic nature of ethnicity when he observes

> the first relates to the variability of ethnic identities The point of view taken in them is that there is nothing inevitable about the rise of ethnic identity and its transformation into nationalism among the diverse peoples of the contemporary world Rather the conversion of cultural difference into basis for political differentiation between peoples arises only under specific circumstances which need to be identified clearly (*Ethnicity and Nationalism* Sage Publications New Delhi 1991)

Urmila Phadnis who has discussed multi-ethnicities of Sri Lanka observes

> Ethnicity is the submission of ethnic consciousness for status and recognition as a distinct social entity (*Ethnicity and Nation Building in South Asia A Case Study of Sri Lanka* 1987)

As a matter of fact though authors have analysed ethnicity from varying perspectives, the fact remains that an ethnic group possesses a greaterdegree of cohesiveness based on common language, traditions, and a common pride for the land of origin Cardene F Ware, while discussing the basic attributes of ethnic communities, says that a community is held together by self-consciousness emerging from race, culture, language and realism T K Oommen[5] has explained ethnicity in Indian context and says that the term ethnic is sometimes used to refer to minorities of various types in Indian society K S Nair who has applied the concept of ethnicity to India's urbanisation (*Ethnicity and Urbanisation*, 1985) uses it as a collectivity of people who (1) share some patterns of normative behaviour, and (2) form a part of a large population interacting with people from other collectivities within the framework of a social system

Conflict Theory of Ethnicity

There is no well-developed theory of ethnicity which dwells on conflict or violence However, it is argued that in the present era of post-modernisation when migration has become part of a worldwide process of urbanisation and industrialisation, the fear of the loss of the ethnic identity might result in conflict Ethnicity in itself is a cultural manifestation, an exhibition of festivals, ceremonies, rituals and folklores There are always interventions in the ethnic manifestations of one group by another Hellen I Safa argues that there is a fusion in ethnicity and class Political conflict, therefore, is the result of their fusion Hellen Safa's argument runs as under

> Discussions of ethnic identity and class structure cannot, therefore be divorced from the political implications of massive intra and international migration Political conflict arises out of *the growth of regional imbalances and income inequality as well as the socio-cultural conflicts between migrant ethnic groups and their host societies* (italics mine)[6]

Scholars who have worked on migration and ethnicity suggest that migration is both a reflection and response to inequality Inequality is an essence of those migrations which are forced or which are the consequences of cohesive or contrived inductions Roy Simon Bryce-Leporte, while linking migration with inequality, observes

> Voluntary migrations on the other hand represent reactions to inequality of opportunity due to various forms of inexactness and inequality among two or more loci of residence These may be short term, long-term, or simply a result of the existence and importance of either or all of such considerations Recent observations in the neo colonial and developing world indicate that these countries find it difficult not merely to fulfil the tradition or standard design of their population but also to match the rising expectations and increasing aspirations of their people[7]

If we critically examine the theory of conflict as given by Paul Brass, it becomes clear that in a plural society as that of our country, ethnic groups are always at loggerheads to make access to power acquisition Historically, there was competition between Muslims and Hindus right from medieval period to the fall of Mughal empire During the British period also both these groups tried to take as much power as possible from the British Raj The creation of Pakistan is nothing but separation or division of power The struggle for power on the basis of ethnic or religious outfits became so pervasive with these two groups, that Hindu-Muslim riots came to be a common occurrence even in post-independence India Now a variety of ethnic groups have come into conflict for power acquisition and consequently it has provided opportunities for the outburst of violence What has been argued by scholars is that migration intensifies and strengthens ethnicities The consolidation of ethnicity and class consciousness ultimately results into violence.

Although each ethnic group's thought is basically cultural, yet it aims at achieving power. When the Manipuri ethnic group or the Rajasthani ethnic group tries and struggles to get a constitutional status for its language, it is to get power from the centre and the state Those who know Manipuri or Rajasthani would get more employment opportunities, thereby exercising a hold in administration When we talk about the Hindi belt, actually, we are talking about the power exercised by Hindi-speaking people Ethnic groups in a democratic set-up always strive to corner a large share of power, and it is here that the conflict is born

Concluding the discussion on the relationship among migration, ethnicity, power and violence or conflict, it must be said that in the Indian context, the four themes cannot be analysed without reference to India's history For instance, if there is violence at inter-ethnic group level it cannot be explained only in terms of empirical variables There is a history behind each ethnic group and its interrelationship In the past, when they were considered to be aggressors, as a distinct ethnic group, they made their acculturation with the local population At a later stage when they came into conflict with the exercise of power there was conflict between the two as predominant ethnic groups In contemporary India, when migration has increased and the media has become electronic, there has emerged a struggle for ethnic identity This identity can be maintained if there is class collaboration When there is an alliance between ethnic groups, class and power, violence and conflict are inevitable It is in this context that we look at the immigrants in a developing community

In Defence of Smallholding Farmers

Gail Omvedt

Smallholders, Householders: Farm Families and the Ecology of Intensive, Sustainable Agriculture by Robert McC Netting; Stanford University Press, California, 1993; pp xxi + 389.

THE problems posed by a rapidly growing population have become even to many scientists the major cause for pessimism about the future of the human race. In an article in the prestigious *Science* magazine that attempts to summarise some basic facts about the human species, Luke O'Neill, Micheal Murphy and Richard Gallagher write that in order to feed the growing world population in the next decades all the scientific ingenuity we have must be used, "including nuclear power and genetic engineering to insure crop yields." ('What Are We? Where Did We Come From? Where Are We Going?', January 14, 1994.)

Genetic engineering is by now well known as a potential Aladdin's lamp for agricultural production, but the thought of nuclear power applied to crop growing is somewhat awe-inspiring. It is, however, symptomatic of a strong conviction among both traditional liberals and traditional Marxists that industrial agriculture represents the most advanced productive form and that the future in this field as in any other lies with centralised, large-scale production. Those seeking to uphold small-scale, low-input 'peasant' production have tended to rest their defence on arguments of ecological sustainability, accepting the same evolutionary framework but arguing that it is precisely the industrialising 'advance of the productive forces' that has to be avoided and that both economic growth and needs (consumption) themselves have to be limited.

Now this basic framework has itself been challenged in an important new work on intensive smallholding cultivation by anthropologist Robert Netting. Combining theoretical verve and empirical studies of farming communities around the world, from Africa and China to North America and Europe, Netting argues that farmers cultivating small areas of land intensively are a socio-economic type (Netting avoids the term 'mode of production' which seems to carry evolutionary assumptions that he disagrees with) that not only has endured thousands of years but is in fact the most viable and sustainable mode of producing food for the future also in situations of high population density.

Smallholding cultivation is defined as households practising intensive, permanent, diversified agriculture on relatively small farms in areas of dense population (a definition that comprises communities as diverse as mountain Swiss farmers and African cultivators) and is distinguished sharply from other forms of social organisation of agriculture such as shifting cultivation (extensive low-input agriculture), plantation or estate agriculture using serf or slave labour, and large-scale high-energy input farming either in its capitalist form using wage labour or as bureaucratically organised collectives. It has, according to Netting, the following characteristics:

(1) In being based on the household, it can make use of labour that is diverse, flexible (a wide variety of tasks can be performed without supervision at varying and variable times), intelligent and more or less willingly applied. Presumably other small collectives or teams of well-motivated workers could work similarly, but historically up to now the family, with people united not simply by economic ties but by bonds of emotion, has been the sole unit capable of such flexibility. Household producers are workers, managers and consumers at once, a fact which gives the household its strength.

(2) As a diversified agriculture (and often agro-forestry) with a relatively great degree of use of local inputs, recycling, complementary production forms, it is one of the most ecologically sustainable forms of cultivation. Netting cites a fair amount of evidence to show that both chemical-industrial large-scale agriculture and extensive agriculture practised in 'frontier' areas tend to be more destructive of soil and forests.

(3) It is also efficient; looked at in terms of energy use, these small farms are more productive per unit of energy than large-scale high-input farming; in terms of labour use the household form allows a more flexible use of more intelligently applied labour (often with intense knowledge of the particular local environments) than farming based on hired labour, slave labour or other forms.

(4) It is primarily based on property holding by individual families, though this is usually combined with common property forms. Netting, as most social scientists do, points out that 'common property' does not mean accessible to anyone (often assumed in metaphors about the 'tragedy of the commons') but is rather property held in common by the local community with well defined household membership. Normally there are individual household property rights in the lands used for crop and garden cultivation, while more extensively used forest and grazing lands are held as CPRs. (Netting sees shifting cultivation or other forms of extensive land use as associated with lineage or other more collective forms of social organisation.)

(5) Smallholding farmers have never been purely subsistence farmers; they have been almost everywhere involved in both production for their own subsistence and for sale; furthermore there is a long history of members of such households engaging in sidelines, supplementary occupation, wage work of various kinds as part of the overall household basis for consumption. This involvement with the market has, according to Netting, even strengthened the dominance of the smallholder form. Thus, while his analysis fits with that of many environmentalists in stressing the viability and ecological sustainability of small farming, unlike many voices dominant today he sees the market more as a friend than an enemy.

(6) Intensive smallholding cultivating communities are by no means egalitarian. There is often substantial internal inequality, varying significantly by region—more in Asia, less in Africa and south-east Asia. Growing involvement with commercial capitalist production can increase this. But Netting denies that the capitalist market (any more than earlier markets) automatically leads to the polarisation into large capitalist farmers and landless wage workers assumed by traditional Leninist theory—for the very simple reason, perhaps, that large-scale centralised farms are not more efficient than the smallholders. Instead the community persists as a stratified and diversified one, with limits to the inequality that develops and with this inequality being minor in comparison to that in the non-farming population or between farmers and the rest of the society. Land concentration, he argues, does not increase over time, though Marxists have frequently used this as an argument to abolish smallholding in favour of 'socialist' collective forms.

The main thrust of Netting's analysis is against the traditional evolutionary model which sees smallholding agriculture as a form connected with 'precapitalist' feudal agriculture, representing a step forward from hunting societies, shifting cultivation, slave and other unfree production but destined to be superseded by large-scale 'capitalist' production or 'socialist' collective forms. In one of his most interesting chapters on China, he argues that the early communist support of a smallholding agricultural development gave way to collectivisation only as a result of political ideology, and that the 'household responsibility system' which developed after 1978 represented the resurgence of the historically efficient and increasingly productive Chinese smallholders.

But Netting's differences with Chayanov, who has put forward what is considered the major alternative model of peasant production, are also important. It is worth stressing these, since it has become normal to describe as 'Chayanovists' all those refusing to admit the reality of peasant polarisation and the destined triumph of large-scale agricultural production.

Chayanov's model saw the peasant household as primarily subsistence producers who did not follow a market logic but instead sought to maintain consumption levels at a historically determined community norm. Here the ratio of producers to consumers was the primary determining factor, with a larger ratio of consumers offset by greater labour input from the working household members. Similarly, the household responded to pressures from outside by intensifying labour input ('self-exploitation' in one phrase); it could thus on its limited land maintain levels of production high enough to 'outcompete' the otherwise more efficient capitalist farms.

Whatever its other faults or virtues, it is clear that in many ways the Chayanovian model does accept the evolutionary framework but rather seeks to explain 'peasant persistence' by ability to resist the process of proletarianisation. Perhaps, then, there was no reason for Stalin's regime to respond so harshly (Chayanov was murdered along with the innumerable 'kulak' farmers he was taken as a spokesman for)! But it is on this point that Netting disagrees. The Chayanovian peasant household, he argues, was developed for the specific Russian context which, with its wide availability of land, low population densities, and lack of infrastructure that often kept peasants totally cut off from market production, was in fact very different from the high population areas of true smallholding production. Russian agriculture, he argues, was actually closer to shifting cultivation—a characterisation that would (in terms of Netting's own classification) make the predominance of collective forms quite understandable.

Netting's is an argument that thus avoids the abstract and unrealistic subsistence-market production distinction and instead rests its assertion of the viability of smallholder production on the argument that a small 'team' of self-motivated producers with locally based knowledge can in fact produce more efficiently that bureaucratically managed labour, whether wage or unfree. He challenges traditional 'Marxist' notions of advances of forces of production in agriculture, but this is perhaps more a challenge to Lenin than to Marx himself. Netting quite effectively shows the viability of smallholding production, but he does not really deal with the changing forms of the relation of smallholders to the state and to landlord/capitalist/bureaucratic exploiters—and in this sense leaves the analysis of 'modes of production' as a task still to be undertaken. It can be argued, for example, that capitalism as a mode of production involves not simply imposition of a market but also an increasingly centralised state that works to dispossess small property holders and impose large-scale production; at least some such analysis is needed to understand why we see the predominance of an industrial-chemical agriculture that is in fact inefficient. Marx's insight in his writings on the French smallholding peasantry was that they also had crucial reasons to fight capitalism, an insight lost in Engel's model and in subsequent Leninism which sees the 'rich peasant' as pro-capitalist and only the proletarianised section of rural producers as a progressive force.

SMALLHOLDING IN INDIA?

Some important questions, however, can be raised about Netting's thesis. One of them is whether the smallholding model can really be applied to India—for the fact is that up to now most students of Indian agriculture stressed its inequalities and rather denigrated the idea that the 'middle peasant' is the main type of producer. Netting's model is far from being a model of the 'middle peasant'—as noted, he stresses the diversity and often stratification of the smallholder community, the degree to which wage labour may be used and cultivation on one's own farm is combined with other forms of income earning. And, those who seek to refute a 'middle peasant' form of agriculture often do so with an unrealistically abstract ideal type middle peasant.

Still, the average inequality (as measured by Gini coefficient ratios) is significantly higher in India than in the majority of farming communities discussed by Netting—with ratios of over .7 for owned holdings and .500-.600 for operated holdings, compared with Gini coefficients of .300-.400 in farming communities in Africa and south-east Asia. Given high internal variation, this means that in the areas of the highest population and greatest cultivation densities—the river valleys and deltas and coastal regions in general, where inequality has traditionally been highest—the inequality between households is even higher. The caste system crystallises this inequality, and where specific communities form communities of dispossessed controlled field labour, it seems hard to characterise the community as a genuine 'smallholding' one. In particular, the non-working upper-caste households controlling dependent field labour and the services of artisans would seem to represent a form nearer to estate agriculture.

However, while inequality is high in India, it has not by and large been increasing and the expected polarisation of big farmer-landless labourer has not developed. Inequality in operational holdings remains significantly lower than that in ownership. The large majority of regions in India would indeed seem to fit the smallholder model. Statistics given in a recent comprehensive survey of *Food and Agriculture* by A Vaidyanathan indicate this (Tables 1 and 2).

TABLE 1: INEQUALITY IN DISTRIBUTION OF HOLDINGS—GINI COEFFICIENTS BY STATES

	Land Owhership		Operational Holdings	
	1961-62	1982	1961-62	1982
Andhra	0.764	0.737	0.617	0.599
Assam	0.634	0.558	0.382	0.519
Bihar	0.701	0.687	0.562	0.616
Gujarat	0.683	0.693	0.521	0.558
Karnataka	0.663	0.685	0.537	0.581
Orissa	0.684	0.650	0.521	0.535
Punjab	0.750	0.735	0.502	0.654
Tamil Nadu	0.749	0.761	0.497	0.640
UP	0.621	0.627	0.506	0.565
West Bengal	0.666	0.670	0.465	0.597
All India	0.720	0.714	0.584	0.629

TABLE 2: GINI COEFFICIENTS FOR VARIOUS ASPECTS OF RURAL INEQUALITY

	1971-72	1981-82
Total assets	0.6551	0.6354
Total productive assets	0.6969	0.6742
Value of land	0.7143	0.6874
Livestock	0.5089	0.4810
Machinery/equipment	0.7070	0.7135
Operational landholding	0.586	0.629
Ownership holdings	0.7110	0.7141

Inequality in operational holdings (which might better reflect the impact of the market, given legal limitations on landholdings) has indeed been growing. Its growth is significant in the Punjab which provides support to proponents of capitalist polarisation. Yet inequality has grown just as much in Tamil Nadu and in Left Front-ruled West Bengal, neither of which has been a 'Green Revolution' success. (It seems also in the case of West Bengal that Operation Barga had little effect in reducing inequality of operational holdings.)

It might be argued that the data are incomplete, they do not cover the 1980s (the period of greater agricultural growth) and they are not specified to regions within the states enough to truly capture trends. Nevertheless, the fact remains that overall inequality is not growing dramatically, and that in most areas smallholder production does remain the dominant form in India. It is clear that there is scope in many regions still for abolishing 'landlordism' and that given already high levels of inequality, there is need to assure the landless and property less access to resources. Genuine co-operative forms also have an important role. But a land reform programme which goes beyond simply abolishing landlordism to move to a bureaucratic collectivisation seen as necessary for the presumably more efficient large-scale capital-intensive cultivation is not justified by any criteria of social justice or productive efficiency. 'Land reform' itself has many meanings, and what is necessary is reform that protects the smallholding community (including protecting its property rights both for individual households and for community control of 'common property resources') from the state and capitalists.

A central aspect of protecting smallholding for India is the fight against caste hierarchy and the caste division of labour. The main argument for the viability of smallholder production rests on its ability to use labour both intelligently and flexibly. But caste institutionalises both the separation of mental and manual labour and the fragmentation of knowledge and skills. It not only creates a section of purely dependent labourers who are not expected to use their minds at all, but a large number of other skills related to agriculture are fragmented and dispersed on a caste basis among artisan households. There has been a tendency for Indian environmentalists to excuse or even praise the caste system as ecologically functional for maintaining diverse types of production in varied and often complementary ecological niches. But none of them would presume to argue that this is consciously done, knowledge itself has been dispersed and fragmented, none of the producers have been expected to have knowledge of the whole. Truly effective smallholder production requires a holistic understanding and would thus seem to necessitate a destruction of both caste hierarchy and fragmentation.

Future of Smallholding

Finally, we come to the most interesting question raised by Netting himself in his final chapter: 'Does the Smallholder Have a Future?' He himself answers yes, on the basis of the energy efficiency of the smallholders, arguing that economies of scale do not operate in agriculture ("when you count all the costs, it is cheaper to raise a zucchini in your garden than on your megafarm") and especially when quality food is concerned the megafarms cannot provide it (Table 3). The smallholding is most adapted to a situation of high population density, and even in the US we could expect the number of farms to increase.

The case for energy efficiency is quite well argued and is backed up by numerous studies from other sources. It also seems quite clear that smallholding has survived up to now because it is in fact an efficient and viable form and that a large part of the dominance of large-scale 'industrial' farming in many areas and the crisis of the small farmer have been related to state intervention policies which have actively fostered an energy-intensive, chemical-based agriculture.

Nevertheless doubts may remain. Population after all is growing, and may it not in the end be necessary to raise production precisely through the application of more energy?

In fact, increased energy input itself may work better with smallholdings: large amounts of energy can be applied to smallholdings and energy itself is of course generated on smallholdings and can be generated in increasing forms (in the form of energy from biomass through gasifiers and solar and wind energy). Further, a major necessity in regard to energy today is that of moving towards renewable rather than non-renewable fossil fuel and nuclear sources, and renewable energy is in many ways inherently more capable of being used by smallholders. The energy question is also one of the efficiency of use of energy—and here smallholdings, once again, may prove much more effective in avoiding the waste that frequently is associated with over-centralised large-scale production.

Not only is increasing application of renewable energy quite compatible with a smallholding production form, so is the application of science to agriculture. The efficiencies of smallholding, as Netting argues, lie to a large degree in the intelligent use of labour and in viable knowledge of local agricultural production methods and environmental conditions. As a farming community—along with the rest of the society—becomes increasingly educated, the quality of this knowledge can be stepped up. Farmers who in the past were very often part workers, part-artisans and craftsmen can very well be part-scientists in the future. And more than managers of large corporations they will be ecologically oriented 'eco-system managers'.

In an 'agricultural agenda for the 21st century', Dean Freudenberger argues that "regenerative agriculture will be solar and biologically intensive instead of being petro chemically and capital intensive. Farmers will be understood as managers of micro biotic communities of which there are millions. Farming will be site-specific. It will attempt to harmonise and enhance the massive diversity of ecological niches. New agricultural infrastructures for research food production and processing will unfold. An agro-ecology will engineer itself in ways that maintain and enhance the health of the land and those who farm it. Agribusiness as we define it today will fade just as soon as oil, gasoline and nitrogenous fertilisers skyrocket in price by the mid 1990s. Undoubtedly, large-scale capital-intensive agricultural assets will shift to other, more profitable places once artificial tax structures which today favour corporate invest

Table 3: Comparison of Energy Inputs and Crop Outputs for Philippine, Chinese and US Rice Production Systems

	Philippines (1962-63)	Dawa China (1979-81)	Louisiana, US (1977)
Input			
Labour (hrs/ha)	576	3,045	25
Animal power (hrs/ha)	272	332	—
Seeds (kg/ha)	108	164	na
Energy (Kcal/ha)	1,825,432	7,577,139	11,460,694
Output			
Rice yield	1,654	8,094	4,114
Rice yield (Kcal/ha)	6,004,020	29,382,672	14,933,820
Efficiency (ratio of Kcal output to Kcal input)	3.29	3.16	1.30

Source: Netting, Table 4.4, p 138.

ments of agriculture are modified to reflect a wider justice for folks still on the land."[2]

The flexibility brought by the new information and communications technology enhances the degree to which diversified and dispersed production forms can absorb new technologies and knowledge. In fact, even in industry it is now being argued that we are in an era when mass production is being replaced by 'flexible specialisation', corporate hierarchies are proving ineffective and being 'flattened', and bureaucratic forms are giving way to more autonomous teams of workers. The household form (particularly once the heavy hand of patriarchy is overcome) in intensive smallholding agriculture proves to be a kind of paradigm of the new 'small is beautiful' model.

But it needs the support of the state. The biggest danger to the smallholder has very often been the fact that centralised states favour centralised industrial producers. Those who talk of a 'level playing field' clamour for special facilities and concessions. In the field of agriculture both bureaucratic interests and the framework of thinking take 'industrial' as equivalent to advanced. Now that agricultural production and exports are being seen as one of the most viable sectors in India, large companies are clamouring for support and the government seems ready to believe that it is these who can efficiently do the task and is ready to give away 'wastelands' and waterlands at throwaway prices, overriding the rights of local communities in the process.

The fact is that without the subsidies and without cheap land the corporations can hardly compete with the small producers. What is needed is to ensure the same kind of (ecologically sustainable) research, extension and marketing services to smallholders—and above all to give local communities and farming households secure rights over the land and other resources. These services can be provided by corporations or state agencies, but in an atmosphere of choice that recognises the rights of local communities. What has been rarely asked about such cases as Kandla and Lake Chilika is why the state had the right to lease away the lands in the first place, why Cargill and Tata were not forced to buy them from their original owners, the local farming and fishing communities.

Why not a 'future for smallholders' in an era when decentralisaton and community empowerment are coming to be seen as a crucial aspect of any genuine socialism? But this means not a state abolition of smallholding under anti-capitalism but a protection of their rights and a social transformation that overcomes caste and patriarchal barriers to equality.

Notes

A Global Battleground

Xavier Dias

The Gulliver File, Mines, People and Land a Global Battleground by Roger Moody, Minewatch, London, distributed by Pluto Press, 345 Archway Road, London N6 5AA, UK, £ 25

IN 1981, Charles Barbour, vice-chair of the American Mining Congress, in response to emerging environment, land rights and third world restrictions, placed on the mining industry, complained: "Like Gulliver, the mining industry is a robust giant held down by a million silk strings". An exasperated Charles Barbour gave Roger Moody the idea for the title of this gigantic task he ventured on to write, taking 20 long years to accomplish. *The Gulliver File* devouring over 894 pages of paper, listing 667 major mining and mineral companies and an equal number of smaller ones, has thus become an event in the history of environmental and land rights struggles of the people all over the world, especially the indigenous nations. *The Gulliver File* was selected by the *Guardian* newspaper (UK), as one of its ten best environmental books of 1992.

With the structural adjustment programmes and the globalisation of our markets, it has become imperative that we know the antecedents and the pedigree of these big conglomerates. Thakazhi Shivasankara Pillai, in his famous novel *The Scavenger's Son*, writes about the information the scavengers collect of their master's diet and health, just by raking through the baskets of night soil. Roger Moody gets his information not only from the horse's mouth—but also from its rear, the tribal indigenous organisations, trade unions, conscious employees, pressure groups and similar sources. *The Gulliver File* is therefore an encyclopedia on the ownership/partnership, genealogy, global operations, and facts on specific mining operations that companies would like to hide. This is in wide contrast to the *Financial Times Mining International Year Book* which depends on the mining companies themselves for the information and data supplied making it a mere directory or 'yellow pages' to suit their own needs.

The Gulliver File carries detailed information on the companies, their subsidiaries and associates, how they acquired mineral rich lands, their influence over the politics of the state and their strong arm local tactics that undermine the very democratic institutions these companies swear by. We, in India, will be encountering some of these companies very soon and their benign names camouflage their true character—11 of them are named after Christian saints! The book has some information too, for those debating on an alternative mining or mineral policy within and outside the present development paradigm. The case of the Nana Regional Corporation, a native corporation of the Inuit nation in Canada: "Nana has also developed a regional strategy aimed at carrying Native proposals into action" (p 217). For trade unions and adivasi organisations in India, there is a lot of useful information, in dealing with these companies. Our mines and minerals are now open to private/foreign companies. On February 26, 1994, in the steel city of Jamshedpur the state minister of mines and minerals Shankar Prasad Tekriwal at a press conference announced that four gold mines have been discovered in Singhbhum district, Bihar, and the state government was contemplating giving them to private parties. Therefore, the book is essential reading for all seeking information to screen these companies as they enter India with the backing of our government, their billion dollar publicity blitz and glittering technology in the post 'Desert Storm' era. However, *The Gulliver File* is limited to only a section of the mining industry—the heavy metals. There are still other avenues of the mineral industry where information is scarce: the mining technologies, know-how, the equipment, the marketing, the cartels, etc. Add to this the fact that mining and mineral industry is just a fraction of the global market. It is frightening to realise how little we know about the pharmaceutical, the bio-technological, the electronics, the agricultural and the consumer industry.

A promising

The Raymond Woollen Mills Limited

Address of the Chairman,
Mr Vijaypat Singhania, at the
Sixty-Ninth Annual General Meeting
on Friday, the 12th of August, 1994.

The Company had another good year with growth in total income, profits and earnings, as you must have read from the Annual Report. What was particularly gratifying was the 40% increase in exports to Rs 73 crores from Rs 51 crores in the previous year.

We are pleased to have been rated sixth in the Survey of India's Most Respected Companies, conducted jointly by BusinessWorld and MARG. We have been ranked the BEST in the category of textiles and fabrics, and stand second in the pecking order in innovativeness, and third for the quality of products.

RAYMOND is now moving into a faster track from a phase of sustained growth attained during the last few years. We are now embarking on an ambitious programme of expansion and diversification to fully avail of the opportunities offered by the more liberal economic environment, and to cater to the rapidly expanding market for the goods manufactured by us and also for special steel products for which we are setting up a new facility.

Let me now spell out our medium-term plans.

TEXTILES

The demand for the Company's products over the last decade has been growing at 11% compounded and we expect it to grow at a more rapid rate in the future, especially as we are targetting to increase our exports by at least 20% annually in volume terms. To meet this enlarged demand, our recently established new textile unit at Chhindwara is being expanded to double its capacity, which will come on stream in early 1995. A new greenfield textile unit is being set up for manufacturing 5 million metres of high quality worsted and blended fabrics. We are planning to commission this by mid-1996.

On completion of these two projects, RAYMOND's total capacity for worsted/blended will have increased by 10 million metres, ie by over 50%, in two years. By 1996, we will be larger than the biggest woollen textile manufacturer in Europe.

> ***"...By 1996, we will be larger than the biggest woollen textile manufacturer in Europe..."***

Co-terminus with the expansion of volume in output, great emphasis is placed on constant improvement in quality, to meet the most exacting global standards. RAYMOND's basic philosophy has always been to upgrade its manufacturing facilities as modern and efficient as possible. Keeping this in view, your management has been continually modernising equipment at its various locations to keep pace with the latest developments elsewhere in the world. This alone, however, is not adequate to emerge as a global player. Technology worldwide is changing very rapidly and cost-effectiveness has become

future, based on strong fundamentals.

imperative to compete in overseas markets and even more so to keep ahead of increasing competition in the domestic market. The Company has, hence, entered into a technical collaboration with two leading international worsted textile manufacturers to ensure that its products achieve the ultimate in quality and also be globally competitive. The positive impact of these technological transfers is already being felt.

CEMENT

The Cement industry which was passing through a dull phase in the last two years is now looking up. Both demand and price realisations have improved. Our expanded capacity of 2.25 million tonnes has now come on stream, and this division is expected to do well in the current year. With our very low capital cost per tonne of capacity and high energy efficiency, this division is well poised to perform better in the coming years

ENGINEERS' STEEL FILES

This division did well despite recessionary conditions in the engineering industry, both in India and overseas. It continues to expand its product range and enter new markets to retain its pre-eminent position as the largest manufacturer of files in the world. It continues to export over 50% of its output.

> *"...the largest manufacturer of files in the world..."*

COLD ROLLED AND SILICON STEEL

We are putting up a steel facility for manufacturing cold rolled steel sheets/strips and silicon steel sheets near Nasik With a view to ensuring the best product quality, we have concluded a Technical Transfer Agreement with Allegheny Ludlum Corporation, Pittsburg, USA, who are among the top manufacturers of special steels in the world. This project is well-timed to be able to cater to the spurt in demand for superior quality special steel from manufacturers of automobiles, consumer durables, and the electrical equipment industry, where the current and future growth rate is expected to be high. With our track record for high quality and achieving optimum capacity utilisation on going into commercial production, we are confident that this project will be successful.

FINANCE

To finance these projects we have already obtained your approval for making a Euro-Issue of up to US$ 100 million. This issue will be made shortly, after Government approvals are received. The proceeds from this issue will be used to part finance the capital outlay on the new textile unit and the steel project aggregating Rs 450 crores.

The future of our Company is certainly promising in view of its very strong fundamentals We expect the total turnover to exceed Rs 2,000 crores, from the current level of Rs 750 crores, by early 1998. Both profitability and earning per share will go up substantially. The Company's net worth is likely to exceed Rs 900 crores by then, and the debt equity ratio decline sharply. As a result, interest burden as a percentage of sales will be considerably lower.

Your management is very conscious of the fact that these ambitious targets can only be achieved by a highly motivated and committed team of employees. RAYMOND has been fortunate in having such a team and the management is placing due thrust on creating a work environment in which the creative energies of its employees can have a full play. The Board has great pleasure in thanking each one of them for their dedication and achievement.

(This does not purport to be a record of the proceedings of the Annual General Meeting)

SINCE 1924

Japan's Changing Political Economy

Domestic Roots of Changing International Relations

E Sridharan

From a broad Indian policy perspective, an understanding of Japan's emerging foreign relations, especially economic relations, with the economically dynamic but politically fluid post-cold war Asia-Pacific region is extremely important. However, any analysis of Japan's emerging international role needs necessarily to be rooted in an in-depth understanding of its domestic political economy and industrial policy regime. This paper discusses the changes in Japan's economic and political system over the past decade and more.

JAPAN bulks large in the world economy. Its GNP is the world's second largest after the US, its trade and current account surpluses the world's largest and it has been for several years one of the world's largest foreign investors, lenders and aid donors. It is also now seeking a permanent seat in the UN Security Council, exploring new relationships in a post-cold war Asia and has an unprecedently tense relationship with the United States in the post-war period. At the same time it has been undergoing gradual but basic changes over the past several years in its domestic political economy and industrial policy regime, the origins of which lie well before the present coalition government and the now three year-old recession.

From a broad Indian policy perspective, an understanding of Japan's emerging foreign relations, especially economic, with the economically dynamic but politically fluid post-cold war Asia-Pacific region is extremely important. There are several possible scenarios. Each of these pose challenges and opportunities for India. However, in our view, any analysis of Japan's emerging international role needs necessarily to be rooted in an in-depth understanding of its domestic political economy and industrial policy regime. This tends to be glossed over in most of the academic and journalistic writing in India on the Japanese role in the emerging Asia-Pacific and world economies. Therefore, the primary focus of this paper is on the changes in Japan's post-war economic and political system over the past decade and more. The treatment is also 'qualitative' in that it focuses on policies and policy changes, with illustrative figures where necessary, rather than being yet another account of Japan's development experience.[1]

I

Post-War Japanese Industrial Policy and Growth up to 1973

Japan's post-war recovery and rapid growth in the 1950s and 1960s until the early 1970s was characterised by a particular pattern of state intervention, government-business relations and private sector industrial organisation. This pattern has been changing since the industrial restructuring following the 1973 oil shock, changing significantly again during the 1980s and currently in the throes of what appear to be fundamental changes in the post-war pattern of industrial organisation and policy. The extent of state intervention's or industrial policy's contribution to Japan's rapid growth is still being debated but there is no doubt that it played a major role. The role of industrial policy until 1973 can be outlined briefly as follows.[2]

The Japanese economy saw a near-10 per cent compound annual growth rate in real terms between 1953 and 1973—the 'miracle' years—overtaking West Germany to become the world's third largest economy by 1969. This took place against the backdrop of the US nuclear umbrella, low defence spending, cheap oil supplies and booming world trade under the multilaterally liberalised post-war trading order. Japan's industrial policy during this period consisted of intervening to promote the competitiveness of domestic firms. The objectives, spheres, instruments and specific measures of intervention varied form the 'miracle' period to the post-1973 oil shock period to the 1980s to the present. The Ministry of International Trade and Industry (MITI) played the leading role, supported by the ministry of finance and other ministries and agencies.

The basic objective during the 'miracle' years was to create competitive industries by focused industrial policy support for industries in which Japan could acquire a comparative advantage and which were the growth industries of the day, thereby enabling Japan to catch up with the west. However, trade and other liberalisations also took place during these years, enjoined on Japan by its becoming a full member of IMF, GATT and OECD by 1964. Industrial policy functioned within these parameters.

A very important development prior to the 'miracle' was the restructuring and rationalisation of Japanese industry during the post-war reconstruction period. The old, family-controlled *zaibatsu* conglomerates were abolished and a new form of industrial con glomerate—the *keiretsu*—emerged. These were conglomerates centred on a main bank and included diversified manufacturing firms, often with considerable vertical integration, and a general trading firm, all interlinked by cross-investments and interlocking directorships. Intra-group cross-shareholding and interlocking directorships along with horizontal and vertical integration meant long-term continuous relationships between stable shareholders, suppliers, distributors and employees. These relationships were based on flexibility, co-ordination and direct competition and helped stabilise the management environment, spread risk, exploit economies of scale and scope and raise long-term capital cheaply, mostly from their main bank. During the 'miracle', Japanese companies had the highest debt-equity ratios among leading industrialised nations. This type of industrial organisation encouraged long-term profit-oriented strategic perspectives and, therefore, investment in modernisation and R and D, risk-taking and high-volume, low-margin, high market share strategic behaviour in global competition.

With such a form of industrial organisation dominant in Japanese industry, the state intervened to promote competitive firms via industrial structure and industrial organisation policies.[3] These were the main spheres of intervention in Japanese industrial policy. Industrial structure policy refers to those policies that influence the allocation of investments among industries. They can broadly be divided into 'forward-looking' policies that promoted or upgraded industries judged to be desirable, and 'backward-looking' policies that phased out or rationalised declining industries. The latter are also called industrial adjustment policies. In the 'miracle' years industrial structure policies were 'forward-looking' as Japan was catching up with the west. From 1973 onwards, 'backward-looking' industrial adjustment policies have also been important. From the 1950s onwards, heavy and chemical industries such as steel, machine tools and parts, shipbuilding, machinery and electrical equipment, and chemicals, were promoted, as well as new and promising industries like

synthetic fibres, petrochemicals, automobiles and electronics. All these industries got special assistance from MITI including low-interest loans, tax concessions, selective import and foreign direct investment curbs and export promotion incentives.

Industrial structure policy, under which these industries were singled out as promising, was guided by two criteria according to the 1963 report of MITI's Industrial Structure Research Council, the key policy advisory body. They were (1) the income elasticity criterion, and (2) the productivity increase rate criterion. Promising industries were those whose products enjoyed high income elasticity of demand and which were expected to enjoy high rates of productivity increase due to technological progress. MITI supported such industries even if they had no current comparative advantage if it was judged that they could rapidly develop comparative advantage in the future with some state support.

Industrial organisation policies—those which intervene in the organisation of individual industries—were also used to support such industries. These consisted of anti-monopoly policies and policies that restricted 'excessive competition' by reducing the number of firms while increasing their scale so that oligopolistic competition among firms of adequate scale, by world standards, is achieved to reap the benefits of both scale economies and competitive pressure. MITI promoted and supported corporate amalgamations, mergers and joint activities including R&D, and at times prevented new market entries. MITI worked closely with industry associations in formulating and implementing industrial structure and organisation policies. The latter were helped by the fact that the *keiretsu* form of industrial organisation allowed flexibility as well as extended time horizons.

Within these two broad industrial policy rubrics a range of measures were employed to get the desired results in different aspects of policy. MITI's industrial policy measures can be lumped under three broad categories: (1) presentation of information, especially 'visions'; (2) restraints and encouragements for firm behaviour through legal actions and administrative guidance; (3) fiscal, financial and tax incentives, i e, government spending, subsidies, procurement policies, soft credit and tax concessions.

The *information infrastructure* provided by MITI, supplemented by other ministries and agencies, consisted of the following: (a) Various industrial and trade statistics and annual White Papers analysing the current situation of industry, trade and the economy; (b) More importantly, MITI presents future-oriented scenarios about industry and trade, highlighting policy issues, called 'visions'. These outline the long-term industry development considered desirable in the national interest based on the best currently available information. The 'visions' have no binding authority. They usually originate as comprehensive reports drawn up after broad-spectrum consultation with experts by advisory bodies to MITI such as the Industry Structure Council and other councils. However, over time they came to constitute one of the most powerful policy tools due to the close interaction among MITI, business, consumers and academics during the formulation process of six months to a year and thus send a strong signal to individual firms as to what is considered desirable by private sector planners and the government taken together.

Restraints and encouragements or incentives and disincentives for firms are provided both by formal laws and regulations as well as by 'administrative guidance', including informal consultation and persuasion. During the 'miracle' years administrative guidance played an important role in discouraging overinvestment, and over the past decade in aiding industrial adjustment and responding to trade friction with the US.

Fiscal, financial and tax incentives have been employed for encouraging investment, R&D and exports. Direct subsidies were probably the least important while preferential government procurement played an important role in the earlier years in new industries, especially in computers and telecommunications.[4] Financial incentives, also called 'policy financing', were important in targeted industrial promotion, especially the Fiscal Investment and Loan Programme (FILP) and soft loans from government-affiliated banks like the Japan Development Bank (JDB). However, these amounted to only a small fraction of bank lending to industry. Tax incentives for investment, R and D, exports and other desired behaviour, were also employed.

However, state intervention was based on clearly defined, well understood criteria, was transparent and neutral as between firms and *keiretsu*, and did not mean 'picking winners' in the Korean sense of specific ties with particular firms or *keiretsu*.[5] Domestic competition remained vigorous and the state apparatus was not captured for rent-seeking by any actor.

II

1973 Oil Shock and After: First Phase of Restructuring

The 1973 oil shock and consequent recession brought an end to the 'miracle' growth phase and precipitated a painful industrial adjustment and policy shift. Four waves of such industrial adjustment took place after 1973: (1) 1973-77; (2) early 1980s after the second oil shock; (3) the post-Plaza Accord (1985) phase of the upvalued yen; and (4) the current phase of restructuring since the recession of 1991 to the present (1994), probably the most fundamental of all.

By the early 1970s the Japanese economy had essentially matured, catching up technologically in mass production industries with the west. It was ready for further economic liberalisation and industrial upgradation. The 'Vision for the 1970s' foresaw further economic liberalisation, especially of capital movements. The basic orientation of this 'Vision' was to change Japan's industrial structure into a more knowledge-intensive one. Such industries were those with greater amounts of 'knowledge-labour' inputs and R and D expenses in total resource inputs or costs and less dependent on unskilled labour, raw materials and energy.

It added two criteria to those laid out in the 1963 'Vision', viz, the density and environment criterion and the better working conditions criterion, for state support. Examples of desirable industries were semiconductors, computers, speciality chemicals, numerically controlled (NC) machine tools and advanced service industries.

However, in the early 1970s, Japan was hit by the 'Nixon shocks'—the prohibition of automatic conversion of dollars into gold and import duties that hit Japan hard, especially on textiles. Japan moved to floating exchange rates, the yen rose against the dollar, hitting exports, and Japanese firms adjusted by adjusting profit margins and prices while seeking to maintain market share. Inflation, already high, was sent skyrocketing by the September 1973 oil shock and the subsequent anti-inflationary policy began to have effect only by 1975. The 1973-75 recession was unprecedented in post-war Japan.

Recovery was export-led over 1973-78 with automobiles and TV sets leading. Japan's industry restructured itself while recovering through exports, but the period since 1973 has been marked by a moderate growth rate of around 4 per cent annually over 1978-1990, half the rate of the 'miracle' years. Growth leaders were the new hitech segments such as advanced machinery, electronics and chemicals (usewise capital goods and consumer durables), while segments heavily dependent on imported raw materials and high labour input, such as textiles and foodstuffs, underwent relative decline.

Three factors contributed to the export drive's success after the 1973-77 downturn. First, a major sales effort abroad, mainly in the US. Second, the yen dropped to 300/$ after 1974 compared to 266/$ in 1973. Third, the *keiretsu* carried out vigorous cost-cutting and rationalisation policies after 1974. This was supported by industrial adjustment assistance stressed in the 'Long Term Vision on Industrial Structure' of 1974.

Consequently, the post-1978 growth pattern that set in and continued throughout the 1980s, had the following characteristics. First, the growth rate slowed down to about

4 per cent while the shift towards electronics, machinery and chemicals continued.

Second, export demand became progressively more important for these segments compared to domestic investment demand.

Third, the increase in exports of these segments were largely to the US market and at the expense of European competitors. In electronics, especially, the Japanese carved out a commanding global position in two stages, occupying the expanding market during the second half of the 1970s, and invading the US market at primarily European, later US, expense in the 1980s. However, in key advanced segments like pharmaceuticals and aerospace the Japanese did not make a significant global mark. The electronics industry, however, shifted from consumer electronics to semiconductors, computers and industrial electronics.

Fourth, from the late 1970s onwards, Japan began accumulating large trade surpluses with the US and the rest of the world that made it the world's biggest investor, lender and aid donor by the end of the 1980s.

Fifth, these shifts following the post-1973 oil shock were accompanied by a modified industrial policy framework. The new policy framework co-ordinated industrial adjustment policy with investments in key technological sectors.

III

Restructuring in 1980s: Prelude to Current Phase

The second oil shock of 1979 accelerated the tendencies in industrial policy that emerged from the 1973-77 restructuring process. It was captured in the 'Vision for the 1980s' of 1980. The new goal was to be the creation of a knowledge-intensive industrial structure which, while pushing such hitech segments as leading sectors, aimed at the diffusion of the most advanced technologies in the products and processes of all industries across the board. Concretely, emphasis was laid on new energy technologies, new materials, 'fifth generation' computing and biotechnologies, and on technological upgradation of service industries.

Before discussing the basic characteristics of Japanese industrial policies in the 1980s it is important to understand the changes from the 1970s onwards in the organisation of production and related technological developments. First, in those industries where the cost structure hampered Japan from preserving its competitive advantage, Japanese firms moved to reduce capacity, relocate to competitive sites abroad or develop new technological niches. Intermediate goods like steel, aluminium, chemical fertilisers, shipbuilding and cardboard, in particular, were affected, with firms developing niches like speciality steels for example. This was helped along by MITI's industrial adjustment policy.

Second, Japanese industry adjusted to changing world market and technological conditions by reorganising production to integrate new technologies such as microelectronics-based information and telecom technologies into design and production. Heavy investments were made from the 1970s in numerically-controlled machine tools, flexible manufacturing systems (FMS) and robotics, and programmed automation generally, and in associated business systems. Priority was given to reducing raw material and energy costs, reorganising the labour process, increasing the productivity of each production complex and improving product quality. Japanese productivity growth began to outstrip that of the US from the late 1970s, although the absolute level of productivity remains below that of the US even today.

There were two important centres of strategic negotiation for these adjustment policies: (1) between MITI and industry; and (2) within the *keiretsu*, which served as a network for information and co-ordination for investment strategies within the group. Flexibility, quality improvement, learning by doing, employee involvement and new technologies were the key elements. The result was new organisational innovations such as just-in-time and zero-defect systems of production and quality control. FMS also helped firms exploit economies of scope by reducing changeover time or machinery downtime. There was also a strong tendency to increase R and D investment relative to capacity expansion investments. Programmed automation, in which the Japanese have been pioneers, consisted in bringing the advantages of rigid or dedicated automation, earlier applied to high-volume mass production characterised by scale economies, to the potential gain from flexibility, the result being programmed batch automation. These developments helped the Japanese production system remain integrated within Japan. It also facilitated the full exploitation of enterprise-wide systems economies at the firm and *keiretsu* levels.

The four basic focal points of Japanese industrial policy in the 1980s can be summed up as: (1) industrial adjustment policy; (2) promotion of R and D; (3) coping with trade friction; and (4) deregulation. The first two existed earlier, gaining importance after 1973, while the last two were characteristics of the 1980s in particular.

(1) *Industrial adjustment policy* aimed at helping firms in industries losing their comparative advantage to diversify into new and promising fields and to generally facilitate transfer of resources out of declining industries with minimal dislocation. The June 1978 General Guidelines of Positive Adjustment Policy (PAP) adopted by the OECD were based on the principle that adjustment be left to the market. Japan's policies are based on the OECD's PAP guidelines and were aimed at the smooth phase-out of declining industries rather than protectionist attempts to keep them going at all costs. There were two forms of support: (i) to help firms shift to new lines in the same industry, e g, to speciality steels or fashion-oriented apparel; and (ii) to help firms shift to other industries.

Measures used for (i) included tax support for accelerated depreciation for equipment or prolonged deferment of losses caused by scrapping equipment. For (ii) the Temporary Measures Law for Structural Adjustment of Specific Industries of 1983 for 26 industries played a major role as industrial adjustment became a permanent feature of industrial policy in the 1980s. Industries affected included aluminium smelting, shipbuilding, electric furnace steel-making, viscose short fibres, ammonia, urea, cement, electric wires and cables. MITI, in consultation with the firms in each industry, drew up a 'structural improvement basic plan' for each industry and cartels were organised, being exempted from anti-monopoly laws, and helped by soft loans and special depreciation, for scrapping excess capacity. In 1987, another law, 'Temporary Measures to Facilitate Industrial Structural Adjustment' was enacted with a nine-year duration.

The general characteristics of the adjustment process in Japan were that import restrictions and tariffs were rarely employed and time limits were strictly adhered to. The fact that Japan was faster-growing and more competitive than most of the OECD helped smoothen the adjustment process compared to Europe and the US.

(2) The *promotion of R and D* assumed heightened importance during the 1980s. The responsibility for R and D is shared between the Ministry of Education and Culture, the Science and Technology Agency and MITI. The latter is responsible for R and D in mining and manufacturing or 'technology development policy'. This consists of the following four spheres of activity:

(i) Presentation of 'visions'.

(ii) Inducement of private R and D through tax incentives, policy financing, subsidies and other schemes. This includes the formation of joint research associations among firms on specific research objectives under MITI's initiative such as several in the semiconductor and computer industries (for example, the 1970s VLSI Project and the early 1980s Fifth Generation computing project respectively). Several large-scale joint public-private research programmes have been launched including the R and D Project of Basic Technologies for Future Industries, focused on superconductivity, new electronic devices, new materials and biotechnologies.

(iii) R and D at research institutes affiliated to MITI.

(iv) Provision of the scientific-technological information infrastructure and co-ordination of international programmes, e g, the Human Frontier Science Programme.

The first two activities have had the major impact on the technological progress of Japanese industry. The reasons behind the success of the joint research projects were that research was well-defined, limited to basic technology, of limited (four or five year) duration and attracted the best brains.

(3) *Trade friction arising from Japan's trade surpluses* became a problem that Japanese policy had to cope with throughout the 1980s particularly with its largest trade partner and trade surplus source, the US. Foreign reaction to Japan's trade surpluses could, in theory, take the form of raising tariffs, creating quota and other non-tariff barriers, imposing anti-dumping duties and seeking voluntary export restraints (VERs) from Japan. It could, on the import side, lead to pressures on Japan to enhance access to its domestic market. Article 19 of GATT permits 'safeguards', i e, emergency restrictions on imports. However, most trade deficit countries have preferred to rely on bilateral agreements restricting imports, quantitative import restrictions unauthorised by GATT or so-called VERs. Japan's policy so far has been to agree to bilateral accords or VERs. Rarely has it retaliated or demanded compensation.

In the first half of the 1980s two trade friction issues arose that have since persisted—automobile and semiconductor exports from Japan to the US. After bilateral negotiations between the governments a VER was agreed to by Japan in 1981. The VER for automobiles has been renewed annually since then with modifications.

In the semiconductor industry, the rapid growth of Japanese memory chip exports to the US and the virtual monopolisation by domestic producers of its rapidly growing domestic market, led to the establishment of a joint working group of trade officials in 1981 and a bilateral agreement on semiconductor trade in 1982, the first of four through 1991; by 1993 the problem was said to have been overcome as the US regained world dominance.[6]

VERs and floor price agreements also exist in steel, machine tools and other industries. However, the key issue is not just that of trade friction per se but of trade friction in hitech fields with technological externalities where a leader can establish technological and market leadership in a number of related fields, and followers then face daunting entry barriers. Semiconductors are such a vital 'strategic' segment and also have defence industrial implications. Japanese industrial policy-makers in the 1970s feared that if Japan remained dependent on foreign supplies of products like semiconductors and computers which are strategic in the sense of having broad-scope spillover effects in other industries, raising productivity and competitiveness in user industries, then foreign oligopolistic firms would enjoy rents or quasi-rents affecting Japanese competitiveness across the board. This led policy-makers to nurture domestic firms in these and other industries.

The same fear in reverse, caused by the success of the vertically-integrated *keiretsu*-backed Japanese firms in semiconductors and computers, led to US protectionism and formation of consortia like Sematech and Microelectronics and Computer Consortium (MCC) in the 1980s. The core of trade friction is not just the impact of Japan's surpluses on short-term output and employment but the fear of its gaining an irreversible lead in strategic technologies that are dependent on high-volume production and require large R and D outlays possible only with large sales revenues. However, the underlying problem is the very different form of industrial organisation in Japan which affords Japanese firms home market protection without trade barriers and a long time horizon for a high-volume, low-margin, high absolute profit and market share-oriented strategy in turn allowing high R and D outlays.

(4) *Deregulation* was the fourth major feature of Japan's industrial policy in the 1980s. The most important deregulatory measures were the privatisation of public sector corporations, the deregulation of telecommunication services and the decontrol of the oil industry. In addition to these specific measures, there was a general trend towards reduction or abolition of regulation and administrative guidance in both industrial structure and industrial organisation policies and greater reliance on non-directive 'visions'.

IV
Second Half of 1980s: Internationalisation of Production, New Salience of Asia and the Bubble Economy

Japanese capital began to flood abroad after the Plaza Accord of September 1985 revalued the yen, relocating production to take advantage of lower costs, and to establish an early presence in markets that might be threatened by protectionism.[7] Most of this capital went to the US, then to Europe, but increasingly it flowed to Asia in unprecedented amounts, generating local exports and growth, and creating a web of regional economic integration in the Western Pacific rim. Very briefly, what happened can be summarised as follows.

The yen began to appreciate against the dollar from February 1985 when it was Y260/$ to November 1988 when it reached Y123/$ after which it weakened to about Y140/$ by late 1990 but then gradually climbed to Y100-110/$ during most of 1993 and early 1994. The steep appreciation of the yen after the Plaza Accord of September, 1985, raised costs of production in Japan, made foreign assets and foreign costs of production cheaper for Japanese companies and triggered off a pattern of adjustment whereby Japanese foreign direct investment (FDI) soared in the following years, peaking in 1989 at $ 67 billion, making Japan one of the top two or three sources of FDI in each of the following years and the largest in fiscal 1989 and 1990. After 1989 there has been an absolute decline in Japanese FDI outflow but at $ 41 billion in fiscal 1991, $ 34 billion in fiscal 1992 and $ 16 billion in the first half of fiscal 1993, it remains one of the world's biggest foreign investors.

An increasing proportion of this FDI outflow went to the developed world, led by the US which received over 44-49 per cent, then Europe, which received around 15-22 per cent, followed by the Asian Newly Industrialised Economies (ANIEs)—Korea, Taiwan, Hong Kong and Singapore—and the ASEAN Five (ASEAN minus Singapore) which collectively received 10-15 per cent. In manufacturing, as far as North America and Europe were concerned, the primary motivation was local sales combined with lower costs of production as well as by fears of being shut out due to the rise of protectionism and European integration. Speculative acquisition of real estate and firms in the mergers and acquisitions boom since the late 1980s were also major motivating factors.

In Asia, however, the primary motivation was lower costs of production and relocation of plants and outsourcing of component production with the objective of export of components and semi-finished goods back to Japan or to third countries, primarily the US and Europe. This was how Japanese manufacturers retained competitiveness. This FDI-led adjustment strategy was complemented by progressive shifts at home to higher value added, knowledge-intensive industries and, especially, services, combined with increased automation. By the early 1990s there was an increasing shift towards non-manufacturing FDI, especially in service industries like finance, insurance, real estate, commerce and other services, both in developed countries as well as in the Asian NIEs. By the first half of fiscal 1993, Japanese FDI cumulatively totalled $ 402 billion worldwide, consisting of $ 176 billion (44 per cent) in North America, $ 80 billion (20 per cent) in Europe and $ 62 billion (15.6 per cent) in Asia.

For Asia, these developments combined with their own developments had the following consequences—economic, political and regional. The flood of Japanese investment led to export-oriented growth of

a kind which was increasingly oriented to regional markets and progressively less dependent on western markets. This was because of general growth of incomes and the intra-regional division of labour created by not only Japanese investment but also by investment from the Asian NIEs in ASEAN, an increasingly significant flow as the former became capital exporters and began relocating labour-intensive production as they upgraded into higher-technology industries due to wage rises. By 1990, of the $ 30 billion FDI flow to ASEAN, as much as half came from the Asian NIEs.

All this led to the rapid growth of regional integration, reflected in the growth of intra-regional trade. Intra-regional trade in Pacific Asia exceeded trans-Pacific trade for the first time in 1991 and reached 42 per cent of the region's total trade. Taken together with the end of the cold war in Asia, including normalisation of relations between the socialist states of Indochina and ASEAN, as well as between China and various other states over the years, South Korea's normalisations with China and Russia, the stage has been set for not only greater economic regionalism, as in the formation of the ASEAN Free Trade Area (AFTA), but also for new political and security frameworks.

Japan will be a key player in any such emergent arrangements, as the dominant economic power and closest US ally in the region, as well as an initiator of the need for new political and security dialogues (the Miyazawa doctrine enunciated in January 1993). For today, Asia is more important for Japan than ever before. Not only is it the most dynamic region of the world and hosts over 15 per cent of cumulative Japanese FDI (21 per cent including Australasia), and accounts for close to half the Japanese trade surplus in 1993, but in terms of individual countries, Indonesia, Hong Kong and Singapore host more FDI than all European countries and Canada, except the UK and Netherlands. And Thailand, China, Malaysia, Korea and Taiwan all host $ 3-7 billion of FDI, the same range as Germany, France, Italy, Belgium, Luxembourg, Switzerland and Spain. And Australia hosts $ 21 billion of FDI, more than any other countries except the US and UK. This makes regional economic, political and security arrangements in the Asia-Pacific critical to Japanese foreign economic relations and foreign policy in the 90s.

At the same time as the post-Plaza Accord overseas expansion of Japanese capital, was the rise of the 'bubble economy' at home in the second half of the 1980s, both responses to the changed economic environment. The 'bubble' was an inflation of asset values, specifically land and stock prices, that began in 1986 and ballooned through the rest of the 80s. It was due to a combination of economic and political factors. Following the Plaza Accord, a G-5 Finance Ministers' agreement to weaken the dollar in the foreign exchange market because the strong dollar did not accurately reflect the US economy, the strong yen sent Japan into recession, leading to measures to increase domestic demand to fight recession, boost imports and prevent the dollar sinking too low against the yen. US Treasury Secretary James Baker had said that unless Japan cut its trade surplus with the US by increasing domestic demand the US would do nothing to stop the dollar's fall. The policy of increasing domestic demand was endorsed by the Maekawa committee of experts, an advisory group to Prime Minister Nakasone, in April 1986. The conventional way of increasing domestic demand was to increase public expenditures, especially on public works. Since the government was in the midst of reducing domestic debt, this was not thought a feasible strategy and monetary policy became the favoured instrument, passing the buck to the Bank of Japan (BOJ).

The BOJ cut the discount rate to a historic low of 2.5 per cent by February 1987, where it stayed for two years. This led to lower interest rates and resumption of growth, but also led to assets inflation. Lower interest rates do not immediately lead to increases in fixed capital investment in a recessionary environment. Rather, the response of investors to lower interest rates is to invest in assets such as stocks, land and some bonds that benefit from such lower rates. Thus the stock and land price inflation of 1987-90, the bubble ballooning rapidly fuelled by borrowed money, with both banks and corporations increasing their exposure.

V

Factors behind Success of Japanese Industrial Policy

Underlying the success of Japan's industrial policy-supported growth (including successful industrial adjustments) were three factors: (i) a particular pattern of government-business relations; (ii) the *keiretsu* form of industrial organisation; and (iii) a particular pattern of labour relations.

Government-business relations in Japan have been characterised by mutual co-operation of a particular kind. It has not been a case of a privileged relationship with certain *keiretsu* conglomerates unlike, say, in Korea between the Park and Chun regimes and certain *chaebol* (Korean conglomerates). Nor did it seek to arbitrate in competition between *keiretsu*. In the eyes of the state all *keiretsu* were essentially treated equally. Rather than 'picking winners' from a given field of competitors, the government encouraged the 'making' of winners on a global scale from a field of equally treated 'qualifiers' through a combination of exposure to competitive pressure and industrial structure and organisation policies, taking into account Japan's possible comparative advantage, economies of scale and other relevant economic criteria. Promotional measures were available in principle to all firms that met certain transparent criteria.

At least until the Tanaka Administration in the 1970s, industrial policy was largely left by politicians to career bureaucrats, who by and large remained unbought by the firms they came in constant and close contact with. So the system did not degenerate into rent-seeking from regulation unlike under regulatory import-substituting regimes like India. Why politicians kept their hands off industrial policy and how bureaucrats remained unbought is a fascinating question explored by many students of Japan's political economy but it remains beyond the scope of this paper.

Second, the *keiretsu* form of industrial organisation helped Japanese firms obtain cheap long-term finance from their group bank, reap economies of scale, spread risks through diversification and horizontal and vertical integration, and a long-term perspective, all of which help make production, pricing and R and D decisions that support a high-volume, low-margin, high absolute profit, world market share-oriented strategy. The *keiretsu* have been key institutions in the acquisition of competitiveness in mass production industries and in high-risk, advanced technology, capital-intensive industries like semiconductors and computers.

Third, interlocking with the first two characteristics of Japan's institutional framework and mutually dependent on them, is Japan's unique labour relations system consisting of lifetime employment and heavily bonus-oriented remuneration. Much international attention has been focused on lifetime employment. However, this covers only a quarter to a third of the workforce and does not apply to the majority of small and medium enterprises. It also has several 'natural' counterparts, the most important of which is the system of remuneration heavily oriented towards biannual bonuses tied to profitability and, hence, indirectly to productivity. Bonus usually amounts to four to five months wages, far higher than anywhere else in the OECD where one month's wage is the maximum.[8] Public sector bonuses reflect private sector bonuses in principle, though not necessarily in practice. They follow the recommendations of the National Personnel Agency. Every spring, metal-based industry unions negotiate bilaterally and sign contracts, followed by machinery industries and then by others.

The bonus system and lifetime employment system in large corporations have many requirements and effects. From the management point of view, bonus implies wage bill

flexibility in tune with profitability. It also means relatively peaceful and co-operative industrial relations since workers and unions have a significant stake in profitability and hence in co-operation with the management. From a national macro-economic point of view, the system tends to raise the national savings rate as the propensity to save from large biannual increments is higher than from monthly salaries. This bonus-oriented remuneration system with its wage bill flexibility is the necessary counterpart of the lifetime employment system. The latter, in turn, conduces to the accumulation of skills and co-operative long-term intra-firm relationships. Enterprise unionism as against Anglo-American type industry-wide unions, reinforces such intra-firm co-operation.

Another counterpart of the lifetime employment system is long working hours and limited wage hikes. After the first oil shock, working hours did not shorten. They lengthened with increased overtime to make full use of capacity. In 1989, the Japanese worked an average of 2,159 hours, of which 254 hours were overtime, compared to 1,957 hours (198 overtime) in the US and 1,989 hours (187 overtime) in the UK, and ever less in Germany and France.[9]

Yet another counterpart of the lifetime employment system is the seniority system followed in large corporations and the public sector where, unlike in the US, people rarely change jobs and cannot shoot up the corporate ladder but only move up in small steps through their working lives. Under this kind of system a senior worker will earn more than a highly qualified new managerial or technical recruit.

A virtual requirement of the lifetime employment system is job flexibility and rotation within corporations. Unlike in the Anglo-Saxon countries and those influenced by them, where job descriptions are very detailed and narrow, originating in a pre-industrial craft system where workers only plied their own 'trade', a worker in Japan enters a company not a post. He has to do whatever he is assigned. Indeed, regular job rotation is the norm as is thorough in-house training. Companies hire fresh recruits every April on the basis of broad job descriptions and the premise of future flexibility. Workers are expected to do multiple jobs; their annual promotions, increments and bonuses are not affected. This, combined with wage bill flexibility due to the heavily bonus-oriented system, makes company adaptability including industrial adjustment that much easier because they can retrain people and reallocate tasks, with the back-up, if necessary, of other companies in the same *keiretsu*, thus upgrading the skill base while avoiding unemployment.

This whole system is also made possible by the vast small and medium industry sector, often sub-contractors to large corporations, which act as a buffer or shock absorber in times of downturn, laying off workers. The system has also been relatively stable due to rapid economic growth over the post-war period compared to other OECD economies, even in the 1970s and 1980s. It has both facilitated such growth and industrial adjustment as well as survived because of it.

VI
Recession of Nineties: Undermining of Post-war System?

This post-war system of industrial organisation and policy is currently facing fundamental challenges due to a number of domestic and international developments. The tendency is to undermine the 'Iron Triangle' of the Liberal Democratic Party (LDP), the bureaucracy and big business which underpins 'Japan, Inc'. First, the three-year recession of 1991-94 following the crash of the 'bubble' economy, the longest in post-war Japanese history, has shaken the system to its roots as it has not been able to generate recovery and renewed growth. The crash in stock and real estate prices has hit the profitability of a large number of Japanese banks and firms. The system of long-term industrial policy of anticipating and developing comparative advantage by improving on foreign innovations with the support of MITI's administrative guidance is no longer working well. Although the Japanese have taken the lead in luxury cars and fax machines in recent years over their European and American rivals, this traditional strategy of catch-up and overtake has not worked in several critical areas such as computers, logic chips, telecommunications and high-definition television.

In computers the Japanese while trying to catch up with IBM in mainframes and Cray in supercomputers, missed out on the PC and general downsizing and distributed data processing revolution. In advanced chips too, especially logic chips and dedicated (custom) high-value chips, the Japanese have been lagging behind even as they have gained dominance over the commodity chip, especially memory chip, market. In telecommunications again, due to continued overregulation and centralisation they have missed out on the networking revolution that marries chip, computer, software and telecom switching and transmission technologies. They have missed out on the over-the-air (cellular) telecom revolution.

And over the course of 1993, the US appears to have regained its technological lead in information technology-based industries with the revolution in digital transmission due to the innovations in digital data compression technology.[10] Japan's analogue high-definition TV technology is effectively obsolete. Due to the ongoing integration of information technologies whereby all products are essentially different systems architectures based on common (or dedicated) components, even Japan's traditional strength in consumer electronics is threatened by the US lead in advanced chips, telecom and networking (Clinton's proposed information superhighways). Japan remains less computerised and networked than the US or even some European countries. Even in automobiles Japan is on the defensive as the US auto industry recovers.

Increasing numbers of Japanese corporations are being forced to abandon the traditional approach of improving on foreign basic innovations and aiming for volume and market share rather than profit. They are increasingly adopting American strategies of leading-edge innovation and profit motivation and with them their inevitable concomitants of financial, employment and supply contract flexibility. The protracted recession has already forced many major corporations to close or 'downsize' factories, putting great pressure on the lifetime employment system despite the cushion of the *keiretsu* system and the small and medium enterprise sector.

Pressure to abandon the lifetime employment system also originates from the fact that its enabling condition—wage bill flexibility due to the bonus-oriented remuneration system—is being eroded by the fact that bonuses are no longer so closely tied to profitability and hence no longer providing the wage bill flexibility that they were intended to. Thus such key institutions of post-war Japanese industrial organisation and policy as lifetime employment and the *keiretsu* system are under threat. In the last three years there has been growing debate in Japan over the advisability of continuing with traditional business practices. Even Japan's burgeoning trade surpluses over 1992 and 1993 are not quite the signs of strength that they appear to be, as we shall argue in a moment.

Second, the end of the long period of Liberal Democratic Party (LDP) rule and the coming to power of a coalition government committed to fundamental political reform has created a new domestic policy climate. The coalition itself is fragile and based on only a broad commitment to political reform, the specifics of which, such as how to redraw electoral district boundaries, are bound to create dissensions both among the conservative parties as well as between the left Socialists and other left parties on the one hand and the conservative majority in the coalition and right Socialists on the other. In January 1994, the reform bill was passed in both Houses of the Diet but only after the Upper House rejected it due to opposition from Socialists. The matter was resolved and the bill passed in a joint sitting of both Houses but only after the Speaker Takak

Diet intervened to arrange a compromise between the then Prime Minister Hosokawa and now-opposition LDP leader Kono.[12]

The basic agreement is to shift to a system where 300 out of 500 seats (down from 511) in the lower house of the Diet are single-member seats. The remaining 200 seats will be allotted to parties on a proportional representation basis. The electorate will vote only once. The under-representation of urban areas will be redressed under the proposed new system. The rules on political financing are to be changed to tighten up on illegal donations. Company donations to politicians are still legal but there are more restrictions such as that there should be only one organisation attached to each politician for fund-raising. Earlier a politician could have multiple organisations so as to circumvent ceilings on donations to political organisations. The Upper House of the Diet is to remain the same for the present.

The present, mostly multi-member (two to six member) district system forces candidates to compete against not only opposition party candidates but against their own party candidates for maximising their votes and thus leads to tremendous pressure to raise money and hence to political corruption. This system tends to blur the distinctions between parties on issues while focusing attention on candidates and puts tremendous pressure on candidates to cultivate their constituents through the building of patronage-based political machines at constituency level. In fact, this traditionally LDP-dominated system focused on candidates and party factions rather than parties and issues, facilitated the autonomy and long-term perspective of the bureaucracy and hence, its long-range policy-making and implementation capacity.

Most observers see further political realignment ahead with the government not lasting its full term, and maybe the emergence of a two-party system with both parties being essentially centre-right in complexion. This may lead to the undermining of bureaucratic autonomy on economic and industrial policy which has been an underpinning of the traditional Japanese industrial policy regime, as policy issues and programmes becomes politicised in a single-member district two-party system, an internationalised economy and a changing world and regional order. The passage of the political reform bill in the Diet in January 1994 marks the beginning of both political reform and domestic political realignment with the consequences for long-term industrial policy hinted at. It remains to be seen how the battle between the reformers and the bureaucracy, big business and the old-style politicians plays itself out.

Third, the record trade surpluses with all its major trading partners, especially the US, has generated tremendous political pressure on Japan to not only reduce its surplus but also to undertake industrial policy and organisational changes that underpin the Japanese pattern of growth and exports. The *keiretsu* system and the Japanese distribution system based on long-term supply contracts that tend to exclude outsiders are under attack in US-Japan trade relations as in the Structural Impediments Initiative launched under President Bush. The Japanese trade surplus in 1992 was $ 107 billion including $ 44 billion with the US. The figures for 1993 are $ 120 billion and $ 59 billion respectively.

However, although this means that the Japanese have deep pockets to dig into to regain a technological and competitive edge, it also reflects stagnant domestic demand which is at least partly policy-induced as, for historical reasons, policy has tended to encourage saving over consumption and domestic infrastructure has been relatively neglected by the standards of an affluent country. It also reflects the fact that in a world recession, raw material and foodstuff prices tend to fall proportionately more sharply than manufactured goods prices, thus boosting the surplus of a manufactured export-surplus country like Japan whose import basket tends to be disproportionately dominated by primary products.[13] However, the loss of competitive edge to the US and Europe in key hitech areas and the deterioration of the 'quality' of its trade surplus with the US, most of it coming from a stabilised slow-growth industry like automobiles, is an indication of the underlying weakening that has taken place behind the trade surplus.

Fourth, the end of the cold war has brought US-Japan trade tensions to the forefront in a way that did not happen earlier and has also lessened the strategic importance of Japan to the US.[14] Earlier American administrations, even the Bush Administration, has tended to subordinate US-Japan trade frictions to the overarching need to maintain the US-Japan political and security alliance, the linchpin of the US Pacific security architecture, in good shape. It is no longer in much doubt that the Clinton Administration will attach such importance to the latter in the post-cold war world, especially when Japan's relations with Russia remain the coolest among Russian relations with any US ally. In addition, the new strategic environment in a fluid and uncertain Asia-Pacific region, due to the great uncertainties about the future courses of Russia, post-Deng China and North Korea, may generate pressure to step up defence spending, partially ending Japan's free ride under the US umbrella.

Following the conclusion of the Uruguay Round of GATT in December 1993 and the passage of the NAFTA bill in the US Congress just before that, and Japan's record 1993 surplus with the US, and the failure of the Clinton-Hosokawa summit in February 1994, the Clinton Administration appears determined to increase pressure on Japan to reduce its surplus by agreeing to numerical domestic market share quotas as well as by reforming its domestic distribution system and industrial organisation. The renewal of the Super 301 clause of the Omnibus Trade and Competitiveness Act of 1988 is a sign of increasing pressure although it will have to be exercised in conformity with GATT rules.

Japan argues, quite legitimately, that numerical quotas are violative of free trade principles and threatens to take the matter to GATT if the US applies sanctions, that the root cause of the trade deficit is the US budget deficit spilling over into the balance of payments, and that domestic industrial organisation is outside the purview of trade policy.[15] The upshot of the trade dispute, however, is its spilling over into domestic politics, politicising economic policy and leading to considerable rethinking about regional and international economic relations, Japan's foreign policy and role in the emerging world order.

Fifth, the ongoing demographic transition in Japan and its newfound affluence are pushing industrial policy in a direction that tends to undermine the pillars of the post-war system, reinforcing the pressures of its trading partners. Japan's is one of the mostly rapidly aging populations and labour forces in the OECD. It is also one of the most affluent countries in the world today, with a per capita income higher than the US. Historically, it has neglected housing and public infrastructure, encouraged saving as against consumption, reinforced by the bonus and lifetime employment system, had long working hours for the same reasons, and neglected its environment relative to its affluence.

There are now strong domestic public, private and foreign pressures reinforcing a shift to public infrastructural and environmentally sensitive spending, reduced working hours, more leisure, more emphasis on consumption including imports and less on saving. Managements in the post-bubble recession want to reduce working hours generally, especially overtime, to 1,800 hours a year on average; this will require massive investments in automation, which in turn will be facilitated by the phasing out of lifetime employment if such is possible. An aging population needs much higher public spending on health and social security; a polluted environment requires higher public investment too. An affluent and highly educated younger generation is more interested in consumption, leisure and the quality of life rather than austerity and long working hours. They are tired of paying prices far higher than world prices for the same goods and services. International

pressures to reduce the trade surplus have already led to tax cuts and increased public spending to stimulate growth and imports.

Sixth, the growing internationalisation of Japanese industrial production, especially its spread to the Asian Pacific Rim described briefly earlier, has created the potential for a Japan-centred economic bloc in the Western Pacific in response to the emergence and consolidation of other regional trading blocs.[16] All these are changing the Japanese political economy and Japan's international relations and foreign policy. We attempt to sketch possible Japanese responses and future scenarios for Japan's international relations.

VII
Japan's Possible Responses and Future Scenarios for Its International Economic Relations and Foreign Policy

There are several possible policy responses to the above economic and political situation by Japan. Very broadly speaking, they would fall into two trajectories, overlapping and non-contradictory, whose resultant course will become clear only over time and depending upon how the world and Pacific regional situation evolves. One broad trajectory would be that of greater integration of Japan with the developed world economies combined with the strengthened centrality of the US-Japan alliance, possibly complemented by a stronger Japanese defence capability.

The other broad trajectory would be a greater degree of economic integration into the Asia-Pacific area combined with the emergence of regional political and security architectures. This does not necessarily preclude the US involvement in the latter, or displace the US-Japan alliance but reduces its importance. In fact, the developed economies and the US alliance relationship would continue to remain central to Japan, but within a more diversified web of relationships.[17]

The appreciation of the yen over 1990-92 and again in 1993-94 to the range of 100-110 yen/$ has affected the competitiveness of Japanese corporations significantly despite their positive effect on imported raw material costs. Japanese industry is employing a range of coping strategies to deal with the problem, compounded further by recessions both at home and abroad and the recent US regaining of an edge in key technologies.[18] Traditional streamlining and cost-cutting measures appear, in many cases, to have reached their limits, raising the issue of continuing with the lifetime employment system. More companies, now, after three years of recession and battered profitability, are emphasising profitability rather than market share in their export strategies, unlike traditionally. In tandem with this, more companies are increasing the share of yen-denominated export contracts as a countermeasure against exchange rate risks, unlike in the 1985-88 yen appreciation phase. Another widespread countermeasure is the increase of outsourcing of parts and semi-finished goods both from foreign producers and overseas Japanese subsidiaries. Despite the falling off of FDI, relocation of parts and components production, especially of labour-intensive items, to lower-wage sites by the creation of new foreign affiliates is also taking place.

At the same time as these countermeasures, Japanese firms are also moving to reduce unit labour and raw material costs through increased productivity by way of increased automation of operations. They are also progressively phasing out low and middle-technology products either by relocation by FDI, or by vacation of these areas in favour of emerging industrial countries like the Asian NIEs and ASEAN, and shifting to high value added, high-technology products. These measures are in harmony with both the emerging Japanese labour shortage due to demographic factors, the increasing stress on environmental and consumer protection and higher labour standards in Japanese industrial policy, and the increasing supply of cheap skilled labour in the developing world. They are also in harmony with the need to focus financial, technological and managerial resources to catch up and keep pace with the US in advanced technologies. Consequently, international strategic alliances in R and D with the US and European compnies have been burgeoning as had mergers and acquisitions over the past several years.

These coping strategies have broad consequences. At one extreme of this policy mix, Japan's trajectory would be towards relatively greater integration with the developed world economies even while expanding its linkages in the Asia-Pacific too in absolute terms, with the continued overriding centrality of the US-Japan alliance in its international relations. Thus a policy mix dominated by a rapid vacation of low-technology, labour-intensive products combined with a rapid shift into high-technology, capital-intensive industries with Japanese FDI going increasingly to developed countries and Japanese corporations focusing increasingly on strategic alliances to develop new technologies and gain leads in Triad (US-Europe-Japan) markets as well as other developed markets like Australia, coupled with a strengthened Japanese defence capability based on hitech electronic warfare (early detection, concealment and interception) capabilities complementary to the US warfighting capabilities in the Pacific, could take Japan on a trajectory of greater integration with the West. This could be intensified if OECD growth picks up, if the European Union and NAFTA remain open, US-Japan and intra-Western trade tensions ease after the Uruguay Round, the technological gap between the developed and developing worlds increases and Asia remains politically unstable and a new Russian nationalism leads to continued US-Russian rivalry.

On the other hand, at the other extreme of the above policy mix, Japan's trajectory would be towards greater integration towards the Asia-Pacific region (including Australasia and the Russian Far East). If OECD growth does not pick up, US-Japan and intra-Western trade tensions continue while the Asia-Pacific region booms and rivals North America and Europe in GNP by 2000 and narrows the per capita income and technology gaps, (Singapore, Hong Kong and Taiwan are already at or approaching OECD income levels) exerting a strong pull effect on Japanese trade and FDI, new political and security arrangements emerge in Asia, including Russia and China, cold war tensions between Russia on the one hand and the US and Japan on the other remain managed, then Japan could while maintaining the US-Japan alliance, get far more economically and politically integrated into Asia in new arrangements blessed by or participated in by the US. The only thing that is extremely unlikely is some sort of Asian bloc of the Malaysian-proposed East Asian Economic Caucus type, formed to countervail the US; any regional security and integration arrangement will have to have at least the tacit blessing of the US to be viable.[19]

What is likely is a Japanese coping strategy and an international, economic and regional environment, post-GATT and post-NAFTA, that produces a policy mix that falls somewhere in the middle. Thus what is likely is growing Japanese economic integration with Asia through trade and FDI relocating industry especially to the fast-growing countries (after all Japanese overseas industrial production is only 6 per cent of domestic production while the US figure is 14 per cent; it can only grow), combined with rapid industrial upgradation into hi-tech activities and even tighter interpenetration of the US and Japanese economies through cross-investments, trade and technological alliances, all based on the continuance of the US-Japan strategic alliance in the Asia-Pacific, even if a US-blessed (or led) Asia-Pacific system of security and political understandings emerges.

Notes

1 This paper is based on research done on my own initiative (in addition to my official project) while I was a Visiting Research Fellow at the Institute of Developing Economies in Tokyo in the first quarter of 1993 and followed up since then from India. The material was gathered on that trip, on all

earlier trip in March 1991 and subsequently in India. I am grateful to the 40-odd people, mostly Japanese but also some foreign Japan-watching scholars and diplomats, too numerous to name here, academics, businessmen, diplomats, officials of MITI, the Ministry of Foreign Affairs and other agencies, journalists and others, who gave me interviews, many of them more than once, and other assistance.

2 In the historical account of post-war Japanese industrial policy I draw heavily upon Chalmers Johnson, *MITI and the Japanese Miracle*, Stanford, 1982; T J Pempel (ed), *Policymaking in Contemporary Japan*, Ithaca: Cornell, 1977; Ezra Vogel, *Japan as Number One: Lessons for Americans*, Cambridge: Harvard University Press, 1979; R Komiya, M Okuno and K Suzumura, *Industrial Policy of Japan*, Tokyo: Academic Press, 1988; Christopher Freeman, *Technology Policy and Economic Performance: Lessons from Japan*, London: Pinter Publishers, 1987; H Patrick (ed), *Japan's High-Technology Industries*, University of Tokyo Press, 1986; K Yamamura and Y Yasuba (eds), *The Political Economy of Japan*, Vol I, Stanford University Press, 1987; Ernani Teixeira Torres Filho, *Industrial Performance and Industrial Structure Policy: The Experience of Japan after 1973*, Tokyo: Institute of Developing Economies, VRF Series No 177, August 1990; Lily Kosiyanon, *The Changing Role of the State in the Development of the Private Sector in Japan*, Institute of Developing Economies, VRF Series No 168, October 1989; MITI-RI (Research Institute of International Trade and Industry), *Japanese Industrial Policy in the 1980s*, 1990, and *The Theoretical Basis of Industrial Policy: Towards a New Horizon in the 1990s*, 1991.

Beliefs and Practices about Food during Pregnancy

Implications for Maternal Nutrition

Moni Nag

As in many other countries, there are traditional beliefs in India regarding specific food items a pregnant woman should or should not eat during pregnancy and about the proper amount of food desirable for a pregnant woman for successful reproductive outcome.

This paper reviews the empirical evidence available from community or hospital studies regarding these beliefs as well as the reasons reported for these beliefs and the extent to which these are reflected in their food behaviour. Programmatic implications of the findings are discussed.

ALL societies have traditional beliefs regarding harmful and beneficial foods for women during pregnancy. There are also beliefs regarding the optimal amount of food to be taken during pregnancy for a successful reproductive outcome. These beliefs may or may not conform to the modern biomedical notions about the proper types and amount of food needed by pregnant women to safeguard maternal nutrition, adequate growth of foetus and safe delivery. Many studies have shown that the food taken by a large section of pregnant women in India is deficient in caloric content, protein and other nutrients—a leading cause of maternal and child mortality.

Three well known reasons for low nutritional status of pregnant women in India are (i) widespread poverty, (ii) discrimination against women and female children in household food distribution and health care, and (iii) lack or poor quality of antenatal care. Whether or not the beliefs and practices regarding food during pregnancy are significant additional reasons for the low nutritional status of pregnant women and undesirable reproductive outcome in India is an important question which has been hardly addressed by scholars. Anthropologists and nutritionists have conducted studies on various aspects of food beliefs and practices of pregnant women in Indian communities and hospitals but most of these are limited by narrow disciplinary perspectives and have not discussed in any depth the possible effects of specific beliefs on the dietary behaviour, maternal nutrition and on reproductive outcome.

The present paper attempts to pull together information relevant to the above question from the available literature. The belief of 'eating down'—the belief that pregnant women should eat less than before pregnancy or should not increase the diet during pregnancy mainly to limit baby size and avoid a difficult delivery—is known to be common in India and many other countries [Brems and Berg 1989]. A critical issue in planning and delivering nutrition and health services that are nutritionally, obstetrically and culturally appropriate for pregnant women is whether this belief has a significantly harmful effect on reproductive outcome in India and, if so, what should be and can be done about it.

This paper will review in two different sections the food items which are believed to be harmful and beneficial in various Indian communities along with the reasons for these beliefs and the extent to which these are actually practised. Since these beliefs are often associated with the concepts of 'hot' and 'cold' foods, an initial section will be devoted to the prevalence and interpretations of these concepts in India. These will be followed by a section on pica foods or foods that are specially craved for by pregnant women and a section on the amount of food believed to be proper in various communities along with the reasons for the beliefs and the extent to which the beliefs are actually practised. The final section will deal with the nutritional effects of the beliefs and their programme implications.

'Hot' and 'Cold' Foods

The concepts of 'hot' and 'cold' foods are quite widespread in India and many other countries but the underlying criteria for classifying foods as 'hot' and 'cold' are often not clear. Although there seems to be some consensus regarding the classification of specific foods as 'hot' and 'cold' and the perceived consequences of taking them in a localised population, considerable variation exists in this respect not only between different countries but also within a country and within its various regions. The studies in India reviewed for this paper indicate that in Indian communities food items perceived as 'hot' are often believed to be harmful for pregnant women and those perceived as 'cold' believed to be beneficial, although in a few communities effects are believed to vary in different stages of pregnancy and also on individual physical constitution. Moreover, a fairly common ethnophysiological theme in India is that a balance of 'hot' and 'cold' is necessary for body's well-being, and since pregnancy generates a state of 'hotness', it is desirable to bring a balance by taking 'cold' foods [Mathews and Benjamin 1979; Nichter and Nichter 1989; Pool 1987; Ramanamurthy 1969]. The diversity in food restrictions and prescriptions in different parts of India is often due to the variation in the classification of specific foods as 'hot' and 'cold' as shown in Table 1.

There is a striking uniformity in the perception of all animal foods (eggs, fish and meat) as 'hot'. In some societies these are perceived as harmful not only because they are 'hot' but because they are believed to make babies too large. Milk, yoghurt and buttermilk are perceived as 'cold' in Gujarat, Uttar Pradesh and Tamil Nadu communities but as 'hot' in a Karnataka community. In an Uttar Pradesh village clarified butter (ghee) is perceived as 'hot' (but not excessively so) and beneficial for pregnant women because it produces blood and gives strength.

Most fruits are perceived as 'cold' in Gujarat, Karnataka and Uttar Pradesh communities but significant exceptions exist. For example, in Karnataka communities banana, papaya, jackfruit, pineapple and all unripe fruits are perceived as 'hot'. Fruits perceived as 'hot' in Tamil Nadu communities are more in number (papaya, pineapple, mango, jackfruit, groundnut and palmyra fruit) than those perceived as 'cold' (coconut and custard apple). In Andhra Pradesh communities banana, papaya and mango are perceived as 'hot'; only fruit perceived as 'cold' is coconut. There seems to be some general consensus in perceiving papaya, pineapple and jackfruit as 'hot' and coconut as 'cold'. There also seems to be a consensus in perceiving jaggery as 'hot',

but sugar is perceived as 'cold' in a Gujarat community and 'hot' in a Karnataka community.

Perceptions regarding 'hotness' and 'coldness' of vegetables vary more than those regarding fruits. Karnataka communities characterised a few vegetables as 'hot' (eggplant, bittergourd, ashgourd, pumpkin, drumstick and bamboo shoots) but none as 'cold'. In Tamil Nadu a few vegetables are perceived as 'hot' (eggplant, bottlegourd, beans, carrot, raddish, drumstick and potato) and a few as 'cold' (eggplant, bottlegourd, ashgourd, pumpkin, raddish, tomato and sweet potato). It may be noted that different communities in the same state may perceive the same vegetable as 'hot' and 'cold' (e g, eggplant, bottlegourd and radish in Tamil Nadu). Even in the same community perceptions between individuals may vary regarding specific food items.

Foodgrains form the staple diet for most people in India. Perceptions about the 'hotness' and 'coldness' of specific grains vary considerably in different regions. More grains are perceived as 'hot' than as 'cold'. For example, wheat is perceived in Andhra Pradesh, Karnataka, Uttar Pradesh and Tamil Nadu communities as 'hot' and as 'cold' only in a Gujarat community. Pulses are perceived as 'hot' in a few communities (Gujarat, Karnataka, and Uttar Pradesh) and 'cold' in none. Sesame seeds are perceived as 'hot' in Gujarat, Karnataka and Tamil Nadu and 'cold' in none. Varieties of grains are sometimes perceived differently in different communities, even in the same state.

Spices and herbs are perceived more commonly as 'hot' than 'cold'. For example, in a Gujarat community some spices (specially, onion, garlic, chillies and fenugreek) are perceived as 'hot' and none as 'cold'. In Tamil Nadu communities ginger and mustard are perceived as 'hot' and none as 'cold'. In a Karnataka community, however, more spices are perceived as 'cold' (cumin, aniseed, amaranth and coriander) than as 'hot' (salt). There is very little information on beverages. Alcohol, tea and coffee have generally been mentioned as 'hot' in a few communities.

Wide variations regarding perceptions of 'hotness' and 'coldness' in various Indian communities, as revealed in Table 1, indicate that the underlying reasons for perceiving specific food items as 'hot' or 'cold' vary considerably. Very few studies cited in this paper have attempted to analyse these reasons. It is, however, clear that the concepts of 'hot' and 'cold' foods generally bear no relation to their temperature or pungency. Also the foods characterised as 'hot' and 'cold' do not seem to possess any common characteristics such as colour, texture and form. The most plausible explanation of categorising some foods as 'hot' and some as 'cold' in most communities perhaps lies in the perceptions people have about the effects which specific foods have on the person who eats them.

Pool (1987) elaborates this relationship in his attempt to explain the classification of some foods as 'hot' and others as 'cold' by a mostly tribal community in Gujarat. In this community perceptions of the hot-cold qualities of food seem to be derived from the disease which is thought to result from eating too much of the food in question. For example, eggplant is perceived as 'hot' because of the belief, perhaps based on some experience, that if a person eats too much of it, he/she will get a skin disease (which is 'hot'); bananas are 'cold' because too many bananas cause coughs and colds (which are 'cold' diseases). All diseases are not categorised as either 'hot' or 'cold' but there was a surprising unanimity among 48 informants in the way they identified 10 diseases as 'hot' and eight as 'cold'. Thus, all skin diseases (common in the community), which are supposed to include scabies, boils, ulcers, measles, chickenpox, smallpox, are thought to be caused by excessive heat in the body. The sources of this heat may be 'hot' food, environmental heat, lack of hygiene or 'unclean blood'. Respiratory diseases, which include coughs, colds, asthma, bronchopneumonia and breathlessness, are perceived as 'cold' diseases caused by excessive cold food or cold weather. Pregnancy and menstruation are considered to be 'hot' stages in which a woman is vulnerable to hot food and hot weather, and particularly prone to hot diseases. It is considered desirable to adjust the amount of heat in the body system to different levels during the various stages of pregnancy. In the early stage when the body is believed to be in a heated state, women are advised to take more 'cold' food in order to avoid abortion and 'hot' diseases. In the third trimester women are supposed to need 'enough heat to expel the infant' and so should take more 'hot' food.

Foods Believed to be Harmful

Table 2 summarises information available from 14 studies which investigated food items believed to be harmful. It includes reasons for the beliefs and the extent to which the beliefs were reflected in actual behaviour. The populations studies are listed in the table in alphabetical order of the states to which they belong. Most of the groups studied are rural communities. One of them (No 5) consists of 500 mothers who attended hospitals and clinics in Mysore. The largest sample of women surveyed (1200, No 13) is drawn from all districts of Tamil Nadu [Ferro-Luzzi 1980]. The next largest is a sample of 1,106 pregnant, lactating and weaning women from 44 villages of Mahabubnagar district of Andhra Pradesh [Jesudason and Shirur 1980]. These are the only two groups for which some quantitative estimates of the proportions of women who actually avoided specific food items are available. For the Andhra Pradesh study estimates of the proportions of women who believed specific foods as harmful are also available. Locality is not known for one of the studies cited (No 14). The beliefs and practices for different categories of food are discussed below.

According to the findings of studies reviewed for this paper, restrictions during pregnancy in India seem to be more prevalent for fruits than for any other food category. The fruit that is most widely believed to be harmful in India is papaya. Next in order of their reported harmfulness are banana, jackfruit and pineapple. Other fruits which are mentioned as undesirable during pregnancy in one or more studies are coconut, custard apple, dates, groundnuts, guava, jambu fruit, mango, melon, nuts and palmyra fruits. Twin bananas are believed to be undesirable for pregnant women in Andhra Pradesh and Tamil Nadu for the fear of giving birth to twins. Among the Bhil women of Gujarat most fruits are believed to be harmful for pregnant women in the third semester of pregnancy because the fruits are believed to be 'cold', causing a sticky layer of 'fat' formed around the foetus making it stuck to the womb [Pool 1987]. Fruit products, such as honey, jaggery, molasses and sugar are believed to be harmful in some communities but for different reasons.

Papaya is reported to be harmful for pregnant women in both the studies of Andhra Pradesh communities, all three studies of Karnataka communities, two studies in Tamil Nadu and one study in Gujarat. In sample surveys conducted in Andhra Pradesh and Kerala in 1971 (not cited in Table 2), 22 per cent of women in Andhra Pradesh and 23 per cent in Kerala stated that papaya should not be taken during pregnancy. In both the states the belief regarding harmfulness of papaya was more common among the upper income group than among the lower income group [ORG, no date].

The most common reason given for avoiding papaya during pregnancy is its quality of being 'hot' and inducing abortion. Other reasons, also perhaps associated with 'hotness', include causation of uterine haemorrhage, white discharge from vagina and diarrhoea. Behavioural evidence of the belief regarding harmfulness of papaya, a widely available multi-seasonal fruit in

India, is not adequate. In rural areas of Mahabubnagar district of Andhra Pradesh, 72 per cent of 1,106 women interviewed reported papaya as harmful during pregnancy but only 2 per cent avoided it during pregnancy [Jusudason and Shirur 1980]. Among 500 women interviewed in Karnataka 35 per cent reported avoidance [Khanum and Umapathy 1976]. Papaya seems to be avoided during pregnancy most widely in Tamil Nadu. A study among 1,200 women from all districts of Tamil Nadu shows that 82 per cent of women avoided it during pregnancy [Ferro-Luzzi 1980].

In an attempt to find explanation for widespread avoidance of papaya in Tamil Nadu not only during pregnancy but also after delivery, at puberty and during subsequent menstruations, Ferro-Luzzi refers to the Tamil term for papaya, papali, which is comprised of two parts, pappa, meaning little child and ari meaning to destroy. The belief in the abortive power of papaya may be a corollary to the widespread belief that taking the fruit is closely followed by the onset of a due or overdue menstrual period. Papaya contains a digestive enzyme, papain, which acts on protein. It is used for softening meat in some parts of India but not in Tamil Nadu. Ferro-Luzzi thinks that the resemblance of papaya with female breast (recognised in Portugal and Puerto Rico) and a few of its other characteristics suggesting female analogies may be associated with the belief in its harmful effect on women. Such an association was, however, not mentioned by any woman in the study sample.

Banana is mentioned as harmful for pregnant women in both the studies conducted in Andhra Pradesh as well as in Gujarat and in one each of the studies conducted in Karnataka and Tamil Nadu. Banana is perceived as 'hot' in some places and 'cold' in others, but it is uniformly believed to be harmful though the reasons for the belief varies from place to place.

Jackfruit and pineapple are believed to be harmful for pregnant women in some communities and the most common reason given for their avoidance is that they are 'hot', often but not necessarily implying that they may induce abortion. Jackfruit is believed to cause infection in both mother and foetus in Karnataka [Nichter and Nichter 1989] and to cause fits in baby in Tamil Nadu [Ferro-Luzzi 1980]. Avoidance of pineapple in Tamil Nadu illustrates very well the behavioural variation that may exist in the same state. In Madurai district of Tamil Nadu 96 per cent of women interviewed said they did not eat pineapple during pregnancy while 94 per cent of women in Kanyakumari reported to have taken it freely. In Coimbatore and Nilgiri districts of Tamil Nadu almost nobody had any objection to pineapple, but it was not readily available. The folk belief in the abortive quality of pineapple was corroborated by an ayurvedic physician in Tamil Nadu, according to whose statistics pineapple acts on the uterus of 5-10 per cent of all women and causes bleeding [Ferro-Luzzi 1980].

Eggplant seems to be the most commonly prohibited vegetable during pregnancy. In the studies reviewed for this paper, next in order of prohibition are pumpkin and sweet potato. Other vegetables mentioned as harmful are ashgourd, bamboo shoot, bittergourd, bottlegourd, beans, cucumber, drumstick, potato, spinach, sweet potato and watergourd. Three of the four studies conducted in Tamil Nadu and one of two each in Andhra Pradesh [Mahadevan 1961] and Gujarat [SRRT 1992] do not include any vegetable in the list of foods believed to be harmful during pregnancy. There does not seem to be any commonality in the reasons given for avoidance of vegetables.

Among the grains, wheat and rice are more commonly believed to be harmful than others. Wheat has been mentioned as an harmful item in Gujarat [Pool 1987], Karnataka [Nichter and Nichter 1989], Uttar Pradesh [Jeffery et al 1989] and Tamil Nadu [Ferro-Luzzi 1980], mostly because it is 'hot' and may cause abortion. The reasons for avoidance of rice is more varied. In the Uttar Pradesh community it is believed to cause abortion not because it is 'hot' but it is 'heavy' ('badi'). In the Gujarat community it is believed to cause a sticky layer of 'fat' around foetus making it stuck to the womb. In the Karnataka community beaten rice is believed to be harmful because it causes excessive toxicity which results in infection both in mother and baby. In Tamil Nadu cold rice in water is believed to disturb the 'hot'-'cold' balance in the baby.

Other grains reported to be mentioned as harmful during pregnancy in various communities of India include bengalgram, horsegram, millet and pulses. Ferro-Luzzi (1980) found that in Tamil Nadu millet was rarely eaten by higher strata groups and in some districts it was avoided by 65-90 per cent of women only when they were pregnant. Horsegram was avoided by 26 per cent of women only when they were pregnant. Jesudason and Shirur (1980) found that pulses were avoided in the Andhra Pradesh community only by a small proportion of pregnant women.

Among the seeds believed to be harmful during pregnancy, sesame seeds were more commonly mentioned than any other. It has been reported to be so in Gujarat [Pool 1987], Karnataka [Khanum and Umapathy 1976; Rao 1985], and Tamil Nadu [Dumont 1957; Ferro-Luzzi 1980]. In all three states sesame seeds are believed to be 'hot', inducing abortion. Of the 1,111 women in all districts of Tamil Nadu interviewed in the study conducted by Ferro-Luzzi, 75 per cent abstained from sesame in one form or another during pregnancy. In that study sesame was second only to papaya as a food believed to induce abortion. The oil extracted from sesame seeds are widely used in India. However, sesame in the form of seeds is believed to be particularly 'hot'. In Tamil Nadu sesame seeds are thought of as being endowed with special power of life and fertility, and of stimulating the ovaries thereby hastening maturity. The reputed quality of sesame in promoting menstrual discharge makes it dangerous during pregnancy. In Tamil Nadu mustard seeds are also believed to be abortificient but only by a small section of population.

In many areas of India large sections of population do not normally take animal foods because of religious prohibition or because they are not affordable. Hence it is not unlikely that some of the survey respondents asked to name the food items believed to be harmful during pregnancy would tend to exclude animal foods.

Egg is reported to be a restricted food during pregnancy in Andhra Pradesh [Jesudason and Shirur 1980; Mahadevan 1961], Gujarat [Pool 1987; SRRT 1992], Karnataka [Khanum and Umapathy 1976; Rao 1985], Uttar Pradesh [Jeffery et al 1989] and Tamil Nadu [Ferro-Luzzi 1980]. Most communities cited its quality of being 'hot' and inducing abortion as reason for its avoidance. In Karnataka it is believed to cause red and blue patches on baby's face and body. In Tamil Nadu the main cause of avoidance is the fear of the baby growing too big. It is also supposed to cause the disease 'muccadaippan', characterised by breathlessness or the symptoms and signs of pneumonia. In Tamil Nadu among 1,034 egg-eaters out of 1,200 women interviewed, 9 per cent avoided eggs during pregnancy. Among 1,106 interviewed in Andhra Pradesh 16 per cent reported egg as harmful during pregnancy but only 3 per cent actually avoided during pregnancy [Jesudason and Shirur 1980].

For religious reason beef is taboo among the Hindus who constitute over 82 per cent of India's population. Non-vegetarians in various communities, however, sometimes take chicken, goat, lamb or pork. The commonly cited reason for avoiding meat is its quality of 'hotness' which induces abortion. In Tamil Nadu meat (usually pork and chicken) is believed to be not only 'hot' but also 'impure' [Ferro-Luzzi 1980]. If taken during pregnancy, it can cause vomiting, skin disease and deformity. If taken after seventh month of pregnancy,

the foetus can grow too large. In Andhra Pradesh 11 per cent of women interviewed (1,106) reported chicken as harmful during pregnancy and 2 per cent actually avoided during pregnancy.

Fish is reported to be harmful during pregnancy in studies conducted in Andhra Pradesh [Nichter and Nichter 1989], Gujarat [SRRT 1992], Uttar Pradesh [Jeffery et al 1989] and Tamil Nadu [Ferro-Luzzi 1980], mostly because it is 'hot' and induces abortion. In one Gujarat community [Pool 1987] only dried fish is believed to be harmful and in one Andhra Pradesh community [Mahadevan 1961] only a combination of fish and milk is believed to be so. In the Tamil Nadu survey among 1,200 women 998 were fish-eaters and among the latter 7 per cent avoided fish during pregnancy.

Some women in Andhra Pradesh [Jesudason and Shirur 1980], Gujarat [Pool 1987; SRRT 1992] and Tamil Nadu [Ferro-Luzzi 1980] are reported to believe milk as harmful during pregnancy. Buffalo milk is believed to be more harmful than cow's milk. Milk is usually perceived as a 'cold' food, sometimes having an adverse effect on women's health. For example, in Tamil Nadu it is believed to produce gas and cause rheumatism. Restrictions against milk products, such as yoghurt, buttermilk and clarified butter ('ghee') are perhaps more common than against milk. But actual avoidance of milk and milk products during pregnancy for their supposedly harmful effect is not widespread. For example, only 3 per cent of the total sample of 1,200 women in Tamil Nadu reported avoidance of milk and milk products during pregnancy [Ferro-Luzzi 1980].

Spices in general are believed to be harmful in Gujarat [Pool 1987; SRRT 1992] and Uttar Pradesh [Jeffery et al 1989] communities. Most of the studies reviewed for this paper mention one or more of the following spices as harmful during pregnancy: amaranth, chillies, fenugreek, garlic, ginger, onion, salt, sour spices and tamarind. The reason most commonly cited for avoidance is their 'hotness' which induces abortion.

Consumption of alcohol among women is rare in India except among tribes and low Hindu castes. The samples interviewed in two Gujarat communities [Pool 1987; SRRT 1992] include a substantial proportion of women from tribes and low castes among whom consumption of alcohol in the form of toddy by women also is not uncommon. Toddy is reported as harmful during pregnancy in both these studies because they are 'hot'. The only other study which mentioned toddy as such is from Andhra Pradesh [Jesudason and Shirur 1980]. In this study 0.4 per cent, 5 per cent and 16 per cent of women among 'scheduled' castes,

TABLE 1: FOOD ITEMS PERCEIVED AS 'HOT' AND 'COLD' BY STUDY RESPONDENTS IN VARIOUS INDIAN STATES

Food Item	States in Which Perceived as 'Hot'	States in Which Perceived as 'Cold'
Food grains and seeds		
Wheat	Andhra Pradesh [Jesudason and Shirur; Ramanamurthy], Karnataka [Nichter and Nichter], Uttar Pradesh [Jeffery et al]	Gujarat [Pool]
Rice	Karnataka [Rao], Tamil Nadu [Mathews and Benjamin]	Gujarat [Pool], Uttar Pradesh [Jeffery et al]
Pulses	Gujarat [Pool], Karnataka [Rao], Uttar Pradesh [Jeffery et al]	
Millet		Gujarat [Pool], Uttar Pradesh [Jeffery et al]
Gram (green)	Karnataka [Rao]	Karnataka [Nichter and Nichter], Tamil Nadu [Ramanamurthy]
Gram (red)	Andhra Pradesh [Jesudason and Shirur]	
Horsegram	Tamil Nadu [Ferro-Luzzi; Ramanamurthy]	
Cowgram	Tamil Nadu [Mathews and Benjamin]	
Maize		Tamil Nadu [Ramanamurthy]
Sesame seeds	Gujarat [Pool], Karnataka [Khanum and Umapathy; Rao], Tamil Nadu [Dumont; Ferro-Luzzi]	
Animal Foods		
Meat	Gujarat [Pool], Karnataka [Rao], Uttar Pradesh [Jeffery et al], Tamil Nadu [Ferro-Luzzi]	
Egg	Andhra Pradesh [Jesudason and Shirur], Gujarat [Pool] Karnataka [Rao], Uttar Pradesh [Jeffery et al]	
Fish	Gujarat [Pool]	
Fish (dried)	Andhra Pradesh [Jesudason and Shirur], Gujarat [Pool], Gujarat [Pool], Tamil Nadu [Ferro-Luzzi; Mathews and Benjamin]	
Milk and Milk Products		
Milk	Karnataka [Rao]	Gujarat [Pool], Uttar Pradesh [Jeffery et al], Tamil Nadu [Ferro-Luzzi]
Yoghurt	Karnataka [Rao]	Gujarat [Pool], Tamil Nadu [Djurfeld and Lindberg]
Buttermilk	Karnataka [Rao]	Gujarat [Pool]
Clarified butter (ghee)	Uttar Pradesh [Jeffery et al]	
Vegetables		
Most vegetables		Gujarat [Pool]
Eggplant	Gujarat [Pool], Karnataka [Rao], Tamil Nadu [Mathews and Benjamin]	Tamil Nadu [Ramanamurthy]
Bottlegourd	Andhra Pradesh [Jesudason and Shirur], Tamil Nadu [Ramanamurthy]	Tamil Nadu [Mathews and Benjamin]
Bittergourd	Karnataka [Nichter and Nichter]	
Ashgourd	Karnataka [Rao]	Tamil Nadu [Ferro-Luzzi]
Pumpkin	Karnataka [Nichter and Nichter]	Tamil Nadu [Mathews and Benjamin; Ramanamurthy]
Beans	Tamil Nadu [Mathews and Benjamin]	
Peas		Tamil Nadu [Ramanamurthy]
Carrot	Tamil Nadu [Ramanamurthy]	
Radish	Tamil Nadu [Ramanamurthy]	T N [Mathews and Benjamin]
Drumstick	Karnataka [Nichter and Nichter], Tamil Nadu [Ramanamurthy]	
Tomato	Tamil Nadu [Mathews and Benjamin; Ramanamurthy]	
Potato	Tamil Nadu [Ramanamurthy]	

(Continued)

'backward' castes and other castes reported toddy as harmful during pregnancy.

Beneficial and Unusual Foods

Information about foods believed to be beneficial during pregnancy is less than that about those believed to be harmful (Table 3) The scanty data available regarding foods believed to be beneficial hardly allow any generalisation. In general, items that are perceived as 'cold' are believed to be good for pregnant women In one community in Gujarat [Pool 1987], however, 'cold' foods are believed to be beneficial in first trimester and 'hot' foods in the third trimester In this community body is perceived to be in a heated state during first trimester, in third trimester body needs further heat so that the baby can be expelled easily by melting the layer of 'fat' formed around it by 'cold' food Milk, milk products and fruits were believed to be beneficial in Gujarat, Karnataka and Uttar Pradesh communities but in Andhra Pradesh and Tamil Nadu communities these were not mentioned as such The ayurvedic system of medicine, documented in *Charaka-Samhita* recommends milk, butter and clarified butter ('ghee') for the well-being of pregnant mother [Sharma 1981]

In one Gujarat community [SRRT 1992] no specific food item was mentioned by survey respondents as beneficial for pregnant women They were of view that food items which were not believed to be harmful for pregnant mothers were good for them Existence of beliefs regarding beneficial effect of specific food items on pregnant women do not necessarily imply their increased consumption because they are usually relatively expensive Only higher income group women are likely to get some advantages out of such beliefs

In one community living in Telengana region of Andhra Pradesh toddy—an unusual item—was believed to be beneficial during pregnancy In-depth interviews with 50 respondents randomly picked from 26 Hindu castes revealed that the belief existed among all the castes except brahmins and three other castes [Mahadevan 1961]. About 16-32 oz of toddy consumed daily or frequently after fifth month of pregnancy was expected to help in intra-uterine movement of foetus and hence in its growth If the new-born baby was found to be covered with 'dirt' (possibly *vernix caseosa*), mother was censured for not consuming toddy during pregnancy So most women actually drank toddy regularly during pregnancy whether they liked it or not Toddy drinking was, however, a regular habit among all adult men and women in that community except the four castes mentioned above. It is supposed to help

elimination and have a cooling effect, particularly during summer.

Craving for Unusual Foods

Some pregnant women in India, as in many other regions of the world, are reported to have craving for unusual—often bizarre—foods. Four studies among those reviewed for this paper report the prevalence of such craving (Table 4). In rural Uttar Pradesh some pregnant women have craving for earth, ash from cooking stove ('chulah'), uncooked rice, bitter foods and sweet things [Jeffery et al 1989]. Among 500 mothers interviewed in hospitals and clinics in Karnataka 18 per cent stated that during pregnancy they had the habit of taking mud, clay, ash, lime, raw rice and charcoal. Craving for mud and clay was mentioned more commonly than other items [Khanum and Umapathy 1976]. In another Karnataka community a few women reported craving for small pieces of stone and limestone during pregnancy [Rao 1985]. Out of 50 pregnant women interviewed in a Gujarat community six reported consumption of baked clay ('mati') and tamarind seeds [SRRT 1992]. There are reports of pregnant women's craving for tamarind in Madurai district of Tamil Nadu [Reynolds 1982], for clay in West Bengal [Mitra 1904-07] and for handloom cloth, slate pencil, clay, charcoal and brick in unspecified localities [Raghuram 1975].

The craving for unusual substances that have no nutritional value is often referred to as pica. The word is derived from latin *magpie*, a bird of fickle appetite noted for its habit of eating or carrying away all manner of extraneous objects. Pica has been reported in all parts of the world and for all age groups and for both sexes. But it seems to occur more characteristically among young children, women in the childbearing cycle and in groups suffering from dearth of food or from deficiency in any important nutrient [Cooper 1951; Halstead 1968; Rosso 1990]. The compulsion to eat earth including clay or other types of soil (geophagia) by pregnant women is very widespread. Clay has a high calcium content but there is some evidence that its intake in substantial quantity may lead to anemia because it inhibits absorption of iron in addition to other possible contributing factors [Halstead 1968, Minnich et al 1968]. No evidence of such relationship has been, however, found in India so far.

Amount of Food

Review literature on food beliefs and practices during pregnancy in India often mentions about the belief in the desirability of eating in moderation during pregnancy for the fear of having a large baby causing difficulty in childbirth [Chatterjee 1991;

Table 2: Food Items Believed to be Harmful during Pregnancy

Respondents, Year of Study, Loc, Source	Food Items Believed Harmful	Reasons for Belief	Practice	Comments
(1) 1106 pregnant, lactating and weaning women; 1970s; 44 villages of Mahabubnagar district, Andhra Pradesh [Jesudason and Shirur 1980]	Papaya (72 per cent)	'Hot'	2 per cent avoided	Papaya, pumpkin, buffalo milk, banana, egg and chicken were items reported by women as their favourite; perhaps a reason why very few adhered to their belief
	Pumpkin (55 per cent)	'Hot', bad for baby and mother, boils, diarrhroea	5 per cent avoided	
	Buffalo milk (20 per cent)	Not available	Avoided by none	
	Banana (20 per cent)	'Hot', 'cold', fever, cough, bad for baby	3 per cent avoided	
	Egg (6 per cent), Chicken (11 per cent)	'Hot', bad for baby	2 per cent avoided each	
	Amaranth, bottlegourd, eggplant, pulses, toddy (each less than 1 per cent)	Various reasons	Avoided by few	
(2) 50 women; 26 Hindu castes; 1960-61; Telengana region, Andhra Pradesh [Mahadevan 1961]	Raw egg, papaya, horsegram (dolichos biflorus)	Induce abortion	Not available	
	Banana	Convulsion in baby		
	Twin fruits	Deformed baby or twin		
	Goat's meat (in summer)	'Hot'		
	Combination of fish and milk	Not available		
(3) 30 women and 30 men, mostly Bhil tribe, 1982-83, Bharuch district, Gujarat [Pool 1987]	In first trimester all items believed to be 'hot': sesame seeds, papaya, eggplant, dried fish, onion, garlic, chillies, jaggery, toddy, most pulses, dates, fenugreek, egg, meat, spices.	'Hot', ratevo (manifested in abortion, stillbirth, rashes, red spots or blotches on skin of baby), exacerbate already heated state in early pregnancy	Not available	
	In third trimester all items believed to be 'cold': yoghurt, butter-milk, banana, groundnut, millet, rice, sugar, milk, wheat, most fruits, most vegetables, all left-overs	'Cold', formation of a sticky white layer of 'fat' around foetus which makes it stuck in womb		
(4) 33 pregnant women in 16 villages; 1991-92; Bharuch district, Gujarat [SRRT 1992]	Yoghurt, milk, banana, left-overs	'Cold', 'sour', too much pain during labour	Adherence to belief quite irrelevant for relatively poor women because they rarely take, the pro-scribed foods in their non-pregnant condition; beliefs affect better-off women	Green coconuts and dates mentioned only by traditional birth attendants
	Fish, meat, egg, toddy	'Hot', induces abortion		
	Oil, spices, salt, meat, fish	Causes ratevo (rashes on skin of mother and baby)		
	Oil, milk, yoghurt, buttermilk, groundnut	Chonic food, difficult delivery, baby sticks to womb		
	Green coconut, dates	Interferes development and delivery of placenta and umbilical cord		
(5) 500 mothers in Mysore hospitals and clinics; 77 per cent Hindu; 1975-76, Karnataka [Khanum and Umapathy 1976]	Papaya	'Hot', induces abortion	35 per cent avoided	Avoided more by illiterate women
	Sesame seeds	'Hot', induce abortion	15 per cent avoided	
	Egg, jambu fruit (syzygium cumini)	Red and blue patches on baby's face and body	19 per cent avoided egg and 17 per cent avoided jambu fruit	

(Continued)

VHAI 1973]. There is, however, a dearth of empirical evidence of its behavioural implications and the extent to which it is changing as a result of antenatal services and education provided by the government and non-government agencies. Five of the studies reviewed for this paper give some information on beliefs regarding the amount of food believed to be proper during pregnancy (Table 4).

In their intensive study of two villages in Uttar Pradesh in 1982-83 Jeffery et al (1989) noted a common belief that a woman's strength can easily be sapped by pregnancy and that her diet should be supplemented with foods regarded as beneficial for coolness and strength, "but not so much that the baby becomes too fat". Many women said that the excessive eating results in such a large baby that delivery becomes difficult and even dangerous. Reasons given for negative effect of excessive eating were, however, not always consistent. For example, one woman, who was initially warned that her baby would be too large because she was too greedy regarding food, actually delivered a small sickly baby. She was then blamed for eating so much that "her tubes became filled with food and the baby became cramped". Very few informants reported, however, any changes in their diet during pregnancy.

Majority of respondents in Nichters' (1989) study of two taluks of Karnataka in the 1980s thought it advisable to eat less or same amount of food as opposed to increased amount during pregnancy. As in Uttar Pradesh villages, the relative ease in the delivery of a small baby was often cited as a reason but here it was reinforced by the belief that a large baby is not necessarily a healthy baby and that in order for a baby to become healthy it should have sufficient space in the stomach for free movement. The foetus is viewed as growing in a "space occupied by food, gas and urine" and hence can have more space for movement if food consumed is less in amount. Some women said that the felt need for food is decreased because of less activities during pregnancy. The major reason for low intake of food by both pregnant and non-pregnant women was their poor purchasing power but the fear of difficulty in delivering large babies and the concept of the need for adequate "baby space" for the foetus to grow healthy were responsible for some pregnant women actually consuming less than their normal diet. Periodic spot visits to 10 pregnant women who stated they took less amount of food during pregnancy confirmed their statements. Morning sickness was also an important reason for limiting food during pregnancy. There were, however, a few women who reported increased amount of food during pregnancy.

TABLE 2: (*Continued*)

Respondents, Year of Study, Loc. Source	Food Items Believed Harmful	Reasons for Belief	Practice	Comments
(6) 282 mothers with young children; mid-1980s; two taluks of Karnataka [Nichter and Nichter 1989]	Papaya, pineapple, unripe fruits, pumpkin, wheat bittergourd, drumstick, bamboo shoots, salt	'Overheating' of body manifested in burning sensation during urination, scanty urine, white discharge; induce abortion and premature delivery	Consumption of foods classified as 'heating' are decreased if not restricted	
	Jackfruit and unctuous vegetables (eg, eggplant, spinach, drumstick), some fishes (eg, Indian mackerel, prawn, shellfish, crab), blackgram, beaten rice	Excessive toxicity (nanju) resulting in blood impurity, wound infections, morning sickness of mother, skin infection of baby		
	Sweet potato, jackfruit, bengalgram, pulses	Gaseous (vayu) foods, cramp the living space of foetus and restrict its movement		
(7) 68 pregnant women; majority Hindu, rest Muslim; early 1980s; three villages in Dharwad district, Karnataka [Rao 1985]	Jackfruit	'Hot', causes sepsis	Some fruits (eg, jackfruit, guava, melon, cucumber) available only in season and hence not important in daily diet	All respondents except three who refused to participate gave similar reasons; groundnuts, coconut and cucumber are commonly eaten items
	Sweet potato	Produces gas		
	Colostrum of cow and buffalo	'Hot', indigestible		
	Papaya	Induces abortion		
	Groundnuts and coconut	'Hot' cause giddiness, vomiting		
	Melon and cucumber	'Cold'		
	Fried foods	'Heavy' indigestible, vomiting		
	Chillies, tamarind, overspiced and sour foods	Indigestion and heartburn		
	Ashgourd (Benimcassa hispida), banana, eggplant	'Hot'		
	Sesame seeds	Bleeding and abortion		
	Guava	Stomach-ache, colds		
	Stale, cold foods	Unappetising and indigestible		
(8) A few women interviewed in-depth, anthropological study; 1982-83, 1985; 2 villages in Bijnor district, Uttar Pradesh [Jeffery et al 1989]	Meat, egg, fish, pulses, wheat, garlic, onion, tea, hot milk, molasses, most spices, most nuts, beans, potato, warm water	'Hot' induce abortion, uterine contractions	Only few informants reported any change in diet during pregnancy; some stopped eating foods unpalatable to them (potato, onion, fish, hot spices); meat, egg, fish consumption insignificant also among non-pregnant women	Some women not aware of any restriction on food during pregnancy
	Rice	'Heavy' food (badi), causes flatulence		
(9) A few women of Kallar caste interviewed in-depth; anthropological study 1949-50; 1 village in Tamil Nadu [Dumont 1957]	Millet (tinai), sesame seeds, pineapple	Induce abortion	Pineapple rarely available	

(Continued)

Most of the pregnant respondents (22 out of 27) in the 1991-92 study conducted by the SEWA-Rural Research Team (1992) in Gujarat villages said that they were eating less during pregnancy than what they normally ate. The queries regarding the reasons for eating less elicited initial responses like "elders say so" or the discomfort of eating normal amount of food during pregnancy. Further probing indicated two contradictory beliefs shared in the community: (1) increased food consumption by pregnant mother makes baby too large and hence causes health risk for mother during delivery; and (2) increased food consumption by mother hampers the growth and health of foetus because the foetus and food share the limited amount of space in the abdomen (similar to the belief in Karnataka cited above). The first belief was more common among the tribal group called the Vasava; the second was more common among the two Hindu castes. Irrespective of their beliefs some women reported that during pregnancy they were unable to eat much because they felt less hungry or uncomfortable after a full meal.

In a controlled study to assess the influence of a health education project in five rural areas of Tamil Nadu with varying extent of MCH services, Mathews and Benjamin (1979) found that in areas with no or very little services 38 to 93 per cent of women thought that baby's health would not be affected if they did not eat enough food during pregnancy. Over three-quarters of women in those areas did not take any additional food during pregnancy. In areas with better and longer services 71 to 83 per cent of women thought that baby's health would be affected if they did not eat enough food during pregnancy. So the MCH services seem to have had an effect on women's belief regarding proper food during pregnancy.

In a diet survey of 68 pregnant women in three villages of Karnataka, 30 refused to indicate the specific amount of food eaten by them during the last 24 hours because of their belief that being specific could have an adverse effect on their nutrition [Rao 1985]. Most of the rest 38 women ate less during pregnancy partly due to their decreased appetite and partly with a view to restrict the size of the baby and avoid difficult childbirth.

Two other studies indicated wide prevalence of the practice of reducing or not increasing the amount of food during pregnancy. One of them conducted in 12 villages of Andhra Pradesh found that pregnant mother's diet was no different from usual family diet and that most of the pregnant mothers except a few who attended the nearby antenatal clinic did not think that pregnant and lactating mothers required additional food [Karan et al 1983]. In

Table 2: (Continued)

Respondents, Year of Study, Loc. Source	Food Items Believed Harmful	Reasons for Belief	Practice	Comments
(10) A few women interviewed in-depth; 1969-72; 1 village in Tamil Nadu [Djurfeldt and Lindberg 1975]	Yoghurt, buttermilk, cold rice in water, cold water in earthern pot	'Cold', disturb balance of cold and heat in delicate pregnant body		
(11) 3850 women; 1975-76; 5 areas of 3 blocks in North Arcot district, Tamil Nadu [Mathews and Benjamin 1979]	Pulses, meat, sweets, Kali	Not available	Avoided by 5 to 16 per cent in different areas	
(12) 48 pregnant women; all scheduled castes; early 1970s; 1 village near Vellore city in Tamil Nadu [Sundararaj and Periera 1973]	Jambu fruit	Blisters in newborn		
	Fruit and root of palmyra (borassus flabellifer)	Obstruct growth of foetus		
	Gingelly seeds, papaya	Induce abortion		
(13) 1200 women; mostly Hindu, rest tribal, Muslim and Christian; early 1970s: all districts of Tamil Nadu [Ferro-Luzzi 1980]	Meat (pork, chicken)	'Hot', induce abortion and vomiting, skin disease, deformity, 'impure', baby too big (if taken after 7th month)	6 per cent of 1059 meat-eaters avoided during pregnancy	Although avoidances are described in the paper with elaborate details, most food items are actually avoided by small proportions of women; considerable variation between ethnic groups and districts; author attempts psychological
	Fish (incl crabs, shark, catfish)	'Hot', induce abortion, nausea	7 per cent of fish-eaters avoided	
	Eggs	Baby too big, other diseases, pain on baby	9 per cent of egg-eaters avoided	
	Buttermilk, yoghurt, buffalo milk	Baby too big, difficult to digest	3 per cent of 1200 avoided	
	Papaya	'Hot', induce abortion, uterine haemorrhage, diarrhoea	82 per cent of 1200 avoided	
	Pineapple	'Hot', induce abortion	95 per cent avoided in Madurai district but only 6 per cent in Kanyakumari district	
	Mango, Jackfruit	'Hot', induce abortion, fits in baby	Not availanic	
	Custard apple, coconut milk	'Cold'	Not available Not available	
	Palmyra fruit	Sickness, particularly asphyxia	Not available	
	Banana	Digestive trouble	Not available	
	Double banana	Birth to twin	Not available	
	Jambu fruit	Baby dark-skinned, venereal diseases, abortion	A few women believed it might be eaten if craved for;	
	Sesame seeds	'Hot', induces abortion, haemorrhage	75 per cent of 1111 avoided	
	Millet (tinai, setaria italica)	'Hot', induces abortion	In some districts 65-90 per cent avoided	Rarely eaten by higher strata
	Horsegram	'Hot', induces abortion	26.3 per cent of horsegram-eaters avoided	
	Wheat, mustard seeds, ginger tamarind, jaggery, honey	'Hot', induces abortion	Sporadically mentioned	
	Ashgourd, bottle-gourd, eggplant	'Cold', pain, headache	Sporadically mentioned	
(14) 302 pregnant women; rural but locality not specified [Sood and Kapil 1984]	Jaggery, sugar, nuts, beans, maize	'Hot', induce abortion	Not available	
	Buttermilk, orange, yoghurt	'Cold', harm foetus		

Note: Figures in parentheses represent the percentages of respondents who believed the item to be harmful.

another study conducted in an unspecified locality of India, 64 per cent of pregnant women restricted their intake of all foods during first six months of pregnancy mainly because they believed that small babies are easier to deliver [Sood and Kapil 1984]. Other reasons given were avoidance of indigestion and advice of mothers-in-law or traditional birth attendants.

Nutritional Consequences

A number of diet surveys among women in Indian communities and hospitals have shown that the dietary intake of a high proportion of them is deficient in some essential nutrients, and that there is almost universally no increase of intake among low income group women during pregnancy [Bhardwaj et al 1990; Bhatia et al 1981; Gopalan 1985; Karan et al 1983; Kaur et al 1982; Khanum and Umapathy 1976; Mathews and Benjamin 1979; Matter and Wakefield 1971; Nath and Geervani 1978; NIN, India 1981; Nichter and Nichter 1989; Rao 1985; Sood and Kapil 1984; Tripathy et al 1987; Walter and Wakefield 1971]. The average intake of pregnant women in both rural and urban areas ranges from 1,200 to 1,600 kcal per day. Urban women weigh an average of 43 kg prior to pregnancy and gain six kg during pregnancy. Rural women generally have to spend more energy than their urban counterpart because in addition to doing household chores they often have to do heavy agricultural tasks. Rural women weigh an average of about one to two kg less and their fatfold thickness is only half that of urban women [Ramachandran 1989].

The deficiency of iron and a few other nutrients in the food consumed by low income group Indian women is reflected in the wide prevalence of anemia among them both in their non-pregnant and pregnant condition. The reported prevalence rate of anemia among pregnant women (haemoglobin less than 11g/dl) ranges from 40 to 50 per cent in some urban areas and 50 to 70 per cent in some rural areas [Jejeebhoy and Rama Rao 1992; Ramachandran 1989]. According to a recent report by an Indian Council of Medical Research Task Force, the National Nutritional Anaemic Prophylaxis Programme started in 1970 for providing iron and folic acid supplements to pregnant women had very little impact in reducing the prevalence of anemia [ICMR Task Force 1989].

The deficiency in dietary intake and its negative effect on the nutritional status of low income group women—both non-pregnant and pregnant—can be attributed mainly to widespread poverty and sex discrimination against women in household food consumption. Although India has been virtually self-sufficient in food production since the late 1970s, a large proportion of its population cannot afford to get their minimum requirement of essential nutrients because of their low purchasing power. In household food distribution, pregnant women hardly get any special consideration. However, the widespread prevalence of beliefs regarding food during pregnancy, as described in this paper, raises the question whether these have any effect on the nutritional status of pregnant women in addition to that of poverty and sex discrimination.

The relative inadequacy of information on foods believed to be beneficial during pregnancy compared to those believed to be harmful may be due to investigators' bias to learn more about food taboos for theoretical and practical reasons. However, even when investigators were able to identify food items which were believed by respondents to be beneficial or harmful

Table 3: Foods Believed to be Beneficial

Source and State	Food Items Believed Beneficial	Reason	Practice
(1) Mahadevan 1961, Andhra Pradesh	Rice water (Kali congee)	Facilitates movement of foetus	16-32 oz consumed daily
	Mercury in the form of rasa para with myrtle leaf pellets or cooked with meat	Provides strength, makes baby's skin fair and clear	
	Toddy	Helps movement and growth of foetus	Consumed daily after 5th month by all except brahmin and few other castes
	All items desired by pregnant women	Keep mother happy and hence good for baby	
(2) Pool 1987, Gujarat	In third trimester all items believed to be 'hot': sesame seeds, papaya, eggplant, dried firsh, onion, garlic, chillies, jaggery, toddy, most pulses, dates, fenugreek, egg, meat, spices	Help to build up necessary 'heat' to melt the layer of 'fat' formed around the foetus caused by 'cold' foods and hence prevent difficult delivery	Not available
	In first trimester all items believed to be 'cold': yoghurt, buttermilk, banana, groundnut, millet, rice, sugar, milk, wheat, most fruits, most vegetables, all left-overs	In early pregnancy stage body is in a heated state, so 'cold' foods help to bring the necessary balance	
(3) SRRT 1992, Gujarat	No specific food particularly beneficial		
(4) Khanum and Umapathy 1976, Karnataka	Milk with saffron	Gives strength, improves baby's complexion	Mostly practised by middle and high income groups
(5) Nichter and Nichter 1989, Karnataka	Tender coconut water, greengram, millet, amaranth, cumin seeds, ripe fruits	'Cold', cooling effect	Consumption not observed to increase significantly unless obvious symptoms of 'overheating' were observed
	Herbal decoctions made from aniseed, coriander, cumin seeds and other vegetable products	Purify and 'cool' blood, remedy for toxicity (nanju) and 'overheating'	
(6) Rao 1985, Karnataka	Freshly cooked food served hot	Easily digestible	Not available
	Milk	Easily digestible, good for lactation	
	Fruits	'Cool', prestigious	
	Clarified butter (ghee)	Palatable, good for lactation	
	Cardamoms, cloves	Help digestion	
(7) Jeffery et al 1989, Uttar Pradesh	Clarified butter (ghee), goat's milk, fruits, squash, cucumber, carrot, spinach, yoghurt, buttermilk, sugar, honey, cinnamon	'Cold'	Unlikely for women to get
(8) Djurfeldt and Lindberg 1975, Tamil Nadu	Rasam prepared from drumstick, herbal leaves, pepper, garlic, fenugreek, tamarind water	Relieves morning sickness, vomiting, giddiness	Not available
Ferro-Luzzi 1980,	Rice	Relieves vomiting	Not available

for pregnant women, it was difficult for them to find out the actual consumption of these items.

Available information indicates that milk and milk products are believed to be beneficial in some communities and harmful in others but since these are relatively costly food items, pregnant women, at least of low-income groups, are likely to derive very little nutritional benefit because of a positive belief about them. For example, in Uttar Pradesh villages studied by Jeffery et al (1989), "dais and village women alike said that a pregnant woman requires foods locally defined as those which produce blood and therefore strength ('taquat'), such as milk, fruit, and also ghee (which is warm but not excessively so), ...yet few of our key informants reported any changes at all in their diets during pregnancy".

A few of the studies reviewed for this paper report that beliefs regarding harmfulness of some specific foods for pregnant women have negative impact on their nutritional status. For example, Nichter and Nichter (1989) think that in Karnataka villages restrictions of the commonly eaten nutrient-rich drumstick, bengalgram, blackgram, groundnuts and others have a deleterious effect on pregnant women's nutrition. According to Ferro-Luzzi (1980), widespread avoidance of papaya (a rich source of vitamin A) by pregnant women

TABLE 4: AMOUNT OF FOOD BELIEVED TO BE PROPER AND FOOD ITEMS CRAVED FOR DURING PREGNANCY

Source and State	Amount Believed to be Proper	Reason	Practice	Food Items Craved for (Pica)	Practice	Comment
(1) SRRT 1992, Gujarat	Most believed amount should be less than pre-pregnancy amount	Two contradictory reasons: (1) increased food makes foetus large and delivery difficult; (2) increased food makes foetus small (and hence unhealthy) because food leaves too little space for foetus to grow	22 out of 27 said they ate less during pregnancy; most women did not have much to eat any time; some ate less because they felt less hungry or uncomfortable if they ate full meal during pregnancy	Baked clay (mati) and tamarind seeds	6 out of 50 women reported to have taken them	
(2) Khanum and Umapathy 1976, Karnataka				Mud and clay (more common); ash, lime, raw rice, charcoal	18 per cent had habits; more in low-income group	Practice associated with anemia
(3) Nichter and Nichter 1989, Karnataka	64 per cent of 282 women said a pregnant woman should eat less or same amount of food as before pregnancy	(1) Delivery easy when baby is small; (2) foetus is viewed as growing in a space occupied by food, gas and urine, and hence less food would allow easy movement of foetus necessary for gaining strength; (3) big baby not necessarily viewed as a healthy baby; (4) decreased felt need for food because of less activity during pregnancy	Periodic spot visits to 10 pregnant women who stated they consumed less during pregnancy confirmed their statement; most of those who favoured increased food consumption could not afford it; morning sickness was an important factor limiting consumption			
(4) Rao 1985, Karnataka	Should eat less during pregnancy	Big baby difficult to deliver	Most women ate less because of the fear of difficult delivery and partly because of decreased appetite during pregnancy	Small pieces of stone or limestone	"Several women admitted craving"	
(5) Jeffery et al 1989, Uttar Pradesh	Should "fill her stomach" but excessive eating harmful	Makes foetus big and causes delivery risk; also the minority belief that foetus becomes cramped and baby becomes sickly	Beliefs and behaviour vary widely, very few reported any change in diet	Earth, ash from chulha (cooking stove made of earth), uncooked rice, bitter foods, sweet foods		
(6) Mathews and Benjamin 1979, Tamil Nadu	38 to 93 per cent of women in different survey areas did not think that less food during pregnancy would harm the baby		Over three quarters of women did not take increased amount during pregnancy			

in Tamil Nadu and other places contributes toward their vitmain A deficiency, a serious health problem throughout India. It can, however, be observed from Table 2 that most of the foods believed to be harmful were actually avoided by small proportion of women. Moreover, animal foods which are believed to be harmful for pregnant women are often not accessible to many women either because of religious restrictions or because they are not affordable. Hence, the beliefs regarding harmfulness of specific foods for pregnant women in various regions of India may contribute toward specific nutritional deficiencies among some localised groups, but perhaps do not affect significantly the caloric and protein intakes of a large proportion of pregnant women. However, this effect may be significant if any item of the staple diet of a community is believed to be harmful for pregnant women and if this belief leads to avoidance or reduced consumption of that item.

On the basis of a review of available international literature on food and nutrition during pregnancy, Brems and Berg (1988) have concluded that the extent to which the phenomenon of "eating down" during pregnancy actually occurs and its effect on birthweight are not known, and that the extent to which nutrition can affect foetal size is not a clear-cut issue. However, they think that the evidence for the relationship between weight gain during pregnancy and birthweight is more compelling than that between weight gain during pregnancy and difficult deliveries. They raise a series of policy and programme issues which, according to them, merit further research and discussion before deciding whether to encourage "eating up" during pregnancy and if so, how to do that effectively for specific cultures.

The review of literature on beliefs and practices in Indian communities presented in this paper indicates that the phenomenon of "eating down" during pregnancy—both in belief system and in actual practice—is quite common in India and may have negative effect on many pregnant women's nutritional level which is anyway low for other reasons. However, whether or not an increased consumption of food during pregnancy can lead to disproportionately large babies causing an increased occurrence of obstructed labour in India needs to be assessed carefully.

Obstructed labour is known to be the most common reason for a difficult delivery and is one of the leading causes of maternal mortality in developing countries, particularly in Africa [Herz and Meashem 1987; Liskin 1992]. One major reason of obstructed labour is the disproportion between the size of foetus and the size of mother's pelvis. The foetopelvic disproportion can occur in three possible ways: (i) the pelvis of mother, because of childhood malnutrition or chronological underdevelopment may be too small; (ii) the baby may be too large; or (iii) a combination of both (Brems and Berg 1988). The shape and, to some extent, the size of the pelvis can be explained more by nutritional factors than by hormonal or genetical factor (Stewart 1984). Maternal diabetes is the most commonly cited factor for disproportionately large foetus (macrosomia), but maternal weight gain during pregnancy, maternal pre-pregnancy weight and maternal height in addition to a few other factors are also cited for such condition [Golditch and Kirkman 1978; Lazar et al 1986].

Urban and rural women in India gain averages of only six and five kgs during pregnancy respectively and the mean birth weights of both urban and rural infants average only 2.7 kgs [Ramachandran 1989]. In consideration of low dietary intake during pregnancy, poor pre-pregnant nutritional status, low weight gain during pregnancy and low birth weight in India, the Indian Council of Medical Research has recommended that the dietary allowances for pregnant women should include an additional 300 kcal and 10 to 15 grams of protein daily, over and above the recommended intake for the age and weight-matched women during the non-pregnant period [ICMR 1984]. The government of India has initiated a number of programmes for providing supplementary food to pregnant women of lower socio-economic groups but a number of recent surveys have shown that the impact of these programmes have been so far quite negligible [India, MW 1991; Jain and Agarwal 1986; Jejeebhoy and Rama Rao 1992]. Although the shortcomings in the implementation of these programmes may be the main factor responsible for their failure, popular beliefs regarding food for pregnant women may have contributed to it.

The evidence of widespread belief regarding the relationship between increased consumption of food during pregnancy and difficult delivery does not necessarily demonstrate that the prevalence of obstructed delivery is very high in India at present or was so even in the past. The distressful incidence of a prolonged obstructed labour without adequate medical care, even if it is rare, is likely to generate fear which spreads quickly and survives for a long time in rural communities. Ignorance about other causes of obstructed labour is likely to encourage the belief that it occurs mainly because of the large size of the baby and that the baby becomes large because of increased food consumption during pregnancy. The available data regarding prevalence of obstructed labour in India is scarce. In her comprehensive review of maternal morbidity in developing countries, Liskin (1992) has cited only one hospital study of obstructed labour in India [Basu 1977] which shows prevalence rate of 2.9 per cent—much lower than the estimates for a few African communities.

It is well known that in India and other developing countries a large proportion of babies die within the first five years of life because of their low birthweight and that maternal malnutrition is primarily responsible for low birthweight [Ebrahim 1987; Gopalan and Rao 1972; Jejeebhoy and Rama Rao 1992; Lechtig and Shrimpton 1987; Ramachandran 1989]. Also, several intervention studies in India and elsewhere have shown the positive effect of nutrient supplementation programmes during pregnancy on birthweight and other reproductive outcomes, if they are designed and implemented properly [Brems and Berg 1988; Dawn and Mitra 1990; Iyengar 1975]. Hence, it seems reasonable to recommend that the programmes in India to encourage "eating up" during pregnancy and to provide supplementary food to poor women who cannot afford it should be strengthened. In addition, the health education programmes should take cognisance of the popular beliefs regarding food during pregnancy in different regions of India and use innovative means to minimise their negative and maximise their positive nutritional effects. For example, in some communities, such as those in Karnataka [Nickhter and Nichter 1989] and in Gujarat [SRRT 1992], it may be desirable to emphasise the usefulness of mother's increased intake during pregnancy in making the baby strong rather than large or heavy.

From Periphery to Centre

Toni Morrison's Self Affirming Fiction

Sunanda Pal

The racist and sexist structure of American society compartmentalises its various ethnic groups, denigrates the coloured as inferior and characterises female and male as being located at the margin and the centre respectively. Toni Morrison's novels explore a world of inter-locking system of race, class and sex oppression which is seen as a threat to Black women's psychological survival.

"I WRITE for black women. We are not addressing the men, as some white female writers do. We are not attacking each other, as both black and white men do. Black women writers look at things in an unforgiving loving way. They are writing to repossess, rename, reown,"[1] Toni Morrison told an interviewer. She belongs to a group of writers in America for whom writing is a liberating tool, a subversive strategy and an artistic mode for self expression. Toni Morrison, Maya Angelou, Alice Walker, Toni Cade Bambara, Gloria Naylor and Paule Marshall are exploring how the intersection of race, class and gender in the American society influences the shaping of Black female life. In the manner of Edward Said who exposed orientalism "as a western style for dominating, restructuring and having authority over the Orient," these writers are exposing the distortion of Black reality by the dominant group for its vested interest. They refute the hierarchical order shaped by the concepts of centre and periphery and question the ideology on which the order is based. They are simultaneously engaged in the project of constructing an Afrocentric perspective and evolving an African-American poetics. In a spirit of self-affirmation they are accentuating their distinctive features and celebrating the difference from the mainstream.

Exploring the complexity of Black female experience in white America, Morrison in her writing attempts to resolve the contradiction inherent in her African-American identity. Conscious of her own marginalisation within the context of the mainstream she started valuing her peripheral existence because, "it was deeper, more complex, it had a tension, it related to the centre but wasn't the centre."[2] In her novels Morrison explores the interesting possibilities that her position offers. She told Salman Rushdie in a telephone interview:

> I am not sure that word 'negro' means, which is why I write books. What is a black child/woman/friend/mother? What is a black person? It seems to me that there are so many things that inform blackness. One of the modern qualities of being an African-American is the flux, is the fluidity, the contradictions...[3]

Her novels are an exploration of the meaning of blackness. What does it mean to be Black in white America? To be a Black woman in a white male hegemonic society? To believe in an indigenous African culture in a world that endorses only Eurocentric culture! To strive for visibility in a society in which blackness signifies invisibility! Moreover, she talks of her writing as 'archaeological explorations', one of her major concerns being the rewriting of Afro-American history from a Black female perspective.

What interest does Morrison's work have for the Indian people? What relevance can her writing, emerging out of a specific political, social, cultural and economic experience, have for us? Considering the post-colonial situation of the Indian people, the African-American experience and the post-colonial Indian experience have many similarities. The tendency of the colonised to imitate the colonisers and to evaluate themselves from the colonisers' view point seems to last much after attaining freedom. The inclination to validate our thoughts and ideas with reference to western ideology reveals a need to reassess ourselves and to reclaim our own heritage and culture.

Besides the commonality of the third world consciousness, there is another factor that brings Morrison's writing close to the Indian experience—the issue of double oppression raised by the dalit women. The problem of double marginalisation caused by the system of caste and gender oppression is the same as the race and gender oppression in America. Like the dalits, the African-Americans are a marginalised group, the 'other' of the dominant group and the women hence the 'other' of the 'other'.

Morrison has said, "My work requires me to think about how free I can be as an African-American woman writer in my genderised, sexualised, wholly racialised world."[4] Questioning the Eurocentric epistemology that canonises all that is white and marginalises the coloured, her concern is with the African-American presence which she feels is central to any understanding o[f] American literature.

Born Chloe Anthony Wofford, o[n] February 18, 1931 in Lorain, Ohio, t[o] George and Ramah Willis Wofford, Morriso[n] majored in English at Howard and Cornel[l] University. After finishing school sh[e] changed her name to Toni. She started he[r] career as a college teacher and later becam[e] an editor at Random House. In 1962, sh[e] joined a writers' workshop at Howard when she began a short story about a little girl' desire for blue eyes. This became the them[e] of her first novel *The Bluest Eye* publishe[d] in 1970.

The Bluest Eye, which exposes th[e] devastation caused by white-cultura[l] domination in the lives of African Americans, achieved tremendous success She went on to write *Sula* (1973), *Song o[f] Solomon* (1977), *Tar Baby* (1981), *Belove[d]* (1987) and *Jazz* (1992)—soaring i[n] popularity with each novel and by 1992 sh[e] was hailed as a writer of national level Besides these novels she has written a shor[t] story about inter-racial relationship, calle[d] "Recitatif" and a play, *Dreaming Emmet* based on the tragic lynching of Emmett Till Her critical essays, entitled "Playing in the Dark" (1992), first presented as a series o[f] lectures at Harvard University, are her path-breaking contribution to the area of Black studies and post-colonialism. The numerous awards she has received for her writing, bea[r] testimony to her genius as a writer. With her powerful narratives set against a historical as well as mythical backdrop, she has captivated the hearts of the common reader as well as scholars of literature. She enjoys the unique distinction of both being a popular writer as well as an outstanding literary figure.

The Nobel prize awarded to her in 1993 is a recognition of her singular contribution in the field of literature, to the cause of the downtrodden. It is tribute to a writer who undaunted by her marginalised position, takes great pride in her Black identity, values her ethnic heritage and inscribes her work with the rich cultural traditions of her community. Though concentrating exclusively on the articulation of African-American experi

in her fiction, she reaches out to the entire world, but more specifically to the third world countries.

Louis Gates Jr, a well-known scholar of African-American studies, reacted to the news of her Nobel prize by saying: "Just two centuries ago the African-American literary tradition was born in slave-narratives. Now our greatest writer has won the Nobel Prize."[5] This statement draws attention to the African-American literary tradition, which started in the form of slave-narratives and has today attained the stature of high literature. Writers like James Baldwin, Richard Wright, Ralph Ellison, Langston Hughes, Alice Walker and Toni Morrison have created a body literature that has distinct identity of its own.

Morrison's achievement makes one recall the earliest slave poet Phyllis Wheatley, whose poetic talent was questioned by the whites who believed that Africans, belonging to a sub-human species, could not possibly participate in a cultural activity like writing poetry. The 18th century Eurocentric thought relegated Black people to a lower rung in the Great Chain of Being. The idea that the African "species of men" were "naturally inferior to the whites" prescribed by thinkers like Hume and Kant went a long way in justifying the enslavement of Africans in America. Southern plantation owners wedded to the pursuit of profit exploited Blacks for their own vested interests. Slaves not only worked tirelessly for their masters but were themselves marketable commodities. Young and healthy Black female slaves, prolific in child bearing, were highly valued for their capacity to "make little niggers for Massa".

To assuage their guilt and to veil their brutal exploitative actions, the dominant group perpetuated a number of negative stereotypes of Blacks during slavery. The long-suffering Christ-like Uncle Tom, the child-like Sambo, the loyal Mammy, the emasculating matriarch and the wild seductress were some such stereotyped images which have endured till today and inflicted immense damage on Black people's psyche. Pained by torturous existence of their slave ancestors and enraged by the denigrating stereotypes, many Blacks considered slavery as a dismal past best forgotten. Perhaps the most humiliating myth was that of the acquiescent slave which has been demolished by the numerous slave-narratives that recount the valiant resistance of slave-narrators to the institutions of slavery and their perilous journey to free states. Frederick Douglas, William Brown, William and Ellen Croft and Hatriet Jacobs in their autobiographical narratives articulate their experience of psychological and physical bondage and highlight their longing for freedom.

Toni Morrison in her novels records the triumphs and complexities of Black life from the painful past of slavery to the frustrating racist present. Her very first novel, *The Bluest Eye* a tragic tale about a young Black girl's longing for blue eyes, examines how the ideologies perpetuated by the institutions controlled by the dominant group influence the construction of Black women's self-image. It was W E B Dubois, the noted Afro-American sociologist, who first drew attention to the deeply rooted 'double consciousness' which afflicts African-American existence. He writes:

> ...the Negro is a sort of 7th son, born with a veil and gifted with second sight in this American world, a world which yields him no true self-consciousness, but only lets him see himself through the revelation of the other world. It is a peculiar sensation this double consciousness, this sense of always looking at one's self through the eyes of others, of measuring one's soul by the tape of a world that looks on in amused contempt and pity.[6]

This identity conflict caused by the stigma of race can lead to psychic fragmentation. Robbed of ancestral heritage and cut off from roots for several generations, the Black Americans are often deluded into thinking that the dominant ideology is the only valid ideology. The American media sells a white way of life to its multi-ethnic society. Through golden haired dolls, Mary Jane candies and an enormous range of cosmetics promising white skin and blonde hair, the dominant group sells an ideal of beauty that is beyond the access of the minority coloured groups. Parents inadvertantly validate this idea as they fondly present blue-eyed dolls to their impressionable children who internalise white values and despise their racial features. Various Black women writers and sociologists like Maya Angelou, Joyce Ladner and Michelle Wallace have poignantly described their first agonising confrontation with their own blackness.

The mass media, the education system and other cultural agencies over which the dominant group has control are the chief means of conveying ideological messages. These institutions perpetuate the values of the dominant white race and reinforce the stereotypes about the minority group. These stereotypes are socially constructed images that are one-dimensional and distorted. Pecola, the young protagonist of *The Bluest Eye*, has internalised the denigrated image of Black women and the idealised concept of white beauty, hence she believes that the absence of white skin and blue eyes is central to her 'ugliness'. The idea of physical beauty is according to Morrison, "probably the most destructive idea in human history and thought".[7] It does not occur either to Pecola or to her mother Pauline that the scale they used for measuring beauty was not applicable to the African-Americans because of their different racial identity. Collins has pointed out:

> From an Afrocentric perspective, women's beauty is not based solely on physical criteria because mind, spirit, and body are not conceptualised as separate, oppositional spheres. Instead, all are central in aesthetic assessments of individuals and their creations. Beauty is functional in that it has not meaning independent of the group.[8]

Morrison's novels present a world of interlocking system of race, class and sex oppression, which is seen as a threat to Black women's psychological survival. The racist and sexist structure of American society compartmentalises its various ethnic groups, denigrates the coloured as inferior and characterises female and male as margin and centre, respectively.

Blacks as 'Other'

The structural device of *The Bluest Eye* deftly exhibits the use of the education system as a site for transmitting ideologies that objectify Blacks as the 'other'. Friere has argued that the education system of the oppressor, though ostensibly humanitarian, is used by the oppressor "to preserve a profitable situation". He points out, "Indeed, the interests of the oppressors lie in changing the consciousness of the oppressed, not the situation which oppresses them... for the more the oppressed can be led to adapt to that situation, the more easily they can be dominated".[9] The education system should aim at awakening the critical faculty which would lead to the obliteration of race and class distinctions. The oppressed, dehumanised by the oppressive system they live in, must learn to see "themselves as men engaged in the ontological and historical vocation of becoming more fully human".[10]

The Bluest Eye begins with the text of a school primer reader:

> Here is the house. It is green and white. It has a red door. It is very pretty. Here is the family. Mother, Father, Dick and Jane live in the green-and-white house. They are very happy...[11]

Young Black students confounded with the poverty, racism and consequent chaos in their lives, learn to associate beauty and order with white Americans and ugliness and disorder with the Blacks. Education thus becomes an obstruction in the process of positive self-construction and effects a submerged consciousness. Morrison is contemptuous of those black women who in the process of liberation have erroneously decided to side with the oppressor. Pecola is depicted firmly entrenched in the ugly reality of her surroundings. The whites either look at her with distaste or simply look through her. Derided by her colour conscious schoolmates for her blackness, despised and ignored by her parents, she develops a precarious sense of selfhood. Ontologically insecure, she is doomed to fragmentation. Her eventual retreat into insanity reveals her pathetic inability to cope with her hostile environment.

Exploring the dynamics of racism and sexism, Morrison does not limit herself to an indictment of the dominant white class

turns her gaze to the problems within the Black community, as she relentlessly exposes intra-racism, male brutalities, female sexual abuse and incest.

The threat of cultural imperialism is a factor that seems to have affected Morrison greatly. She continues her exploration of the consequences of culture-conflict in *Sula* (1973) and *Tar Baby* (1982). "Higher education for blacks is a waste of time at best, truly destructive at worst,"[12] Edelberg has argued. Sula and Jadine, the protagonists of the two novels, alienate themselves from their community after acquiring higher education. Indeed, Sula bemoans the loss of neighbourhood ideas as the close knit small town transforms into "separate houses with separate televisions and separate telephones and less and less dropping by".[13] However, both Sula and Jadine consciously reject the values of their community as they set out on a quest for self-definition in terms of their dual African and American identity.

In *Tar Baby* Sorbonne educated Jadine attempts to identify herself with the whites but she cannot obliterate the fact that her authenticity lies in her African descent and the westernised image she projects is a false image. The episode of her encounter with an African woman who represents "all loveliness and life and breath in the world" reveals her inner contradictions. She is unnerved by the contempt this woman displays towards her and continues to be haunted by this vision. This "woman's woman that mother/sister/she"[14] embodies the African-American aesthetic for beauty which is not based on physical criteria as explained by Collins. By constructing this aesthetic, Morrison provides a point of resistance to the system of domination that denigrates Blacks and indicates a move towards self-empowerment. This self-confident African woman with a majestic gait, is in fact, Morrison's vision of self-defined and self-empowered Black woman, who while endowed with a self-affirming Afrocentric consciousness, is comfortable in the European environment and becomes the cynosure of all eyes. This woman with tremendous self-esteem offers a powerful challenge to the externally defined images of Black women. She represents hence a definite step towards generating an Afrocentric feminist epistemology.

Female presences abound in *Tar Baby*. The 'night' women and the swamp women collectively threaten the westernised identity of Jadine. The town of Eloe steeped in Black folk traditions is set as a contrast to the urban life-style of Jadine. But Morrison is not making a simplistic statement like Africa is the source of all good and Europe the source of all evil. She is aware that everything in Black culture is not worth hanging on to. There is a need for discarding certain aspects and enriching it with something from the modern American culture.

There is nevertheless the need to know and accept ancestral heritage. For the materialistic and upwardly mobile African-Americans ancestral connections are of supreme significance. Pilate in *Song of Solomon* (1977), a powerful culture bearer who inspires and guides Milkman in his quest for identity is one of the most unforgettable creations of Morrison. An antithesis of her brother Macon whose sole aim in life is material progress, she represents connectedness with family and with the past. The female community that she has made with her daughter Reba and grand-daughter Hagar is spiritually rich and balances freedom with connection. In her commitment towards the survival and wholeness of her community Pilate embodies a 'womanist'[15] vision.

By reclaiming their past African-Americans are learning to come to terms with that painful period in their history which seemed to them best forgotten. Black history is now being re-interpreted from the perspective of African-Americans as subjects rather than as objects. The emphasis is on the subtexts that lie beneath the historical facts which will unravel the 'interior lives' of the slaves. For delving into the subjectivity of figures in history what more suitable mode than literary fiction!

Revisionist Historiography

Morrison boldy takes up the project of revisionist historiography in writing *Beloved* (1987). This Pulitzer award winning novel is centred around the factual account of Margaret Garner, the fugitive slave mother who killed her infant daughter to save her from "the seething hell of slavery". The incident is widely reported and discussed in February and March issues of *The Liberator* in 1856. Taking just the broad outline of the event, Morrison takes recourse to imagination as she delves into the inner recesses of the minds of the traumatised slaves in order to discover why they acted as they did. She makes an attempt to examine the construction of Black subjectivity in the context of the heinous institution of slavery.

With a strong desire to discover what tragic stories lay underneath the numerous unmarked graves of Black people in America, Morrison resurrects the dead daughter of Margaret Garner and makes her question the order that necessitated her untimely death. Her project is to signify on those ordinary African-Americans who had resisted the inhuman oppression of slavery in ways which could not be deemed heroic in conventional terms but were heroic nevertheless. She writes into Black history those painful stories which have been bypassed by the controllers of history. Refusing to accept existing traditional history written by the whites as absolute and unquestionable, Morrison questions the paradigms on which historical 'facts' were constructed. And perhaps even more significantly, she deliberately forces her Black American readers to remember those denigrating experiences of their ancestors from which they were suffering a "national amnesia".

"It was not a story to pass on", she writes at the end of *Beloved*, "so they forgot her like an unpleasant dream during a troubling sleep",[16] thus highlighting the dilemma of telling a story that was not meant to be told. The story that begins in acute pain resists remembering. Moreover it is also the story of the nameless. "Disremembered and unaccounted for, she cannot be lost because no one is looking for her and even if they were, how can they call her if they don't know her name? Although she has claim, she is not claimed".[17] Rewriting the history of those who have been invisible in the existing history, to remember the nameless and the forgotten is a difficult task. Yet they have the claim to be a part of history, they need to be accounted for and this is the task of revisionist historiographer. Morrison's reminder at the end of the novel of silence and amnesia hence is as Marilyn Mobley points out, "an ironic reminder that the process of consciously remembering not only empowers us to tell the difficult stories that must be passed on, but it also empowers us to make meaning of our individual and collective lives as well".[18]

Morrison once pointed out that she depended heavily on the 'ruse of memory' for two reasons:

> One, because it ignites some process of invention, and two, because I cannot trust the literature and the sociology of other people to help me know the truth of my own cultural sources.[19]

Through the school teacher's racist anthropology Morrison condemns the representation of Blacks in the dominant discourse. Sethe is enraged when she hears him instructing his nephews to write down the human and animal characteristics of the slaves. Her decision to run away signifies her rejection of the slave holder's epistemology and an assertion of her own humanity. The stories Sethe, Baby Suggs, Nan, Ella, Paul D, Stamp Paid and others tell contribute to the re-writing of history of slavery from the subject position of African-Americans.

The devastating experiences of slaves during the Middle Passage from Africa to America is another period of history that needs to be written. Cruelly snatched from their homeland and dehumanised aboard the slave-ships, the slaves suddenly and unexpectedly were confronted with the agony of displacement and commodification. Morrison likens this trauma to death and makes Beloved in one section speak as a survivor from a slave-ship. With the aid of literary aesthetic, she invokes the entire scene of intense suffering in the Middle Passage.

Emphasising that her *metier* is Black Morrison has said:

In the third world cosmology as I perceive it, reality is not constituted by my literary predecessors in western culture. If my work is to confront a reality unlike that received reality of the west, it must centralise and animate information discredited by the west-discredited not because it is not true or useful or even of some racial value, but because it is information held by discredited people, information dismissed as "lore", or "gossip" or "magic" or "sentiment" [20]

Her novels transport us into a world in which there are flying Black men, blind horse men, swamp women, spirits and even a wild woman living naked in the forest. In *Beloved* no one questions the idea of the ghost co-habiting with Sethe and Denver, because her appearance was not a violation of African religion and philosophy. The mode of magic realism facilitates the presentation of an alternate reality, discredited by the west. By effecting "a poetic transfiguration of the object world" the repressed history of slave women is made intelligible. The device is used with great success by Morrison to critique historiography. Magic realism which is a post-modern device takes an unexpected turn in the hands of Morrison to emerge as a component of African-American poetics, since it becomes the means of creating an African world-view. African cultural traditions thus are integrated into contemporary western literary tradition.

In her novels Morrison relocates conceptual agendas and introduces a new consciousness. The context of her writing arises out of her position which provides her the interesting possibilities of "descredited" knowledge intersecting with Eurocentric epistemology. She has problematised the paradigms of knowledge as conceptualised by the west. The fabulous world she presents in her novels postulates a belief in an alternate reality in which spirits can cohabit with human beings. She blurs the boundaries between past and present, between the spirit world and the material world and by doing so she simultaneously revisions history and validates a set of assumptions rejected and trivialised by the west. Her position tends to evoke shocked responses from those readers who have internalised a Eurocentric world-view. "Ghosts! Do you mean to say she actually writes about ghosts," exclaimed an eminent professor. It is not the validity of ghosts that is the important issue but the respect that is given to a set of assumptions that may be different from one's own.

Feminist concerns like female self-realisation, mother-daughter relationship, friendship between women and community bonding are central to her writing. While the sisterly bond between Claudia and Frieda in *The Bluest Eye* empowers them to fight racial denigration, Pecola's alienation from family and community results in her psychic fragmentation. *Sula* explores the friendship

between Nel and Sula, which nurtures them through girlhood. At the end of the novel, Nel needs to realise the value of her friendship with Sula in order to disperse the gray ball of depression that had enveloped her for years. Presence or absence of supportive communities or women friends, acceptance or rejection of these support systems often determine the lives women characters. In *The Bluest Eye* Pecola's ontological 'insecurity' arises out of the absence of nurturing figures around her. Unlike Claudia, who survives unscathed under the same system, Pecola has no sister to share her problems with. Some of the most lyrical scenes in Morrison's novels are those which reflect joyous harmony between mothers and daughters. Pilate, Reba and Hagar singing together as they go through their daily chores in *Song of Solomon* and Sethe, Denver and Beloved skating with gay abandon in *Beloved* reveal an intuitive closeness that bonds the women together. In both the scenes harmony and joy are conveyed through music and rhythm. These women are weighed down by socio-economic problems but at these utopian junctures they seem to transcend all pain as they unite to create a beautiful world of togetherness. Communities of women in Morrison's novels act as support systems facilitating the survival of Black women in a hostile environment. These communities though replete with differences and complexities represent a specific culture and a specific value system. What is refreshing about them is that they are presented from the subject position of Morrison as an African-American woman. Their terms of assertion are determined by a discourse in which they occupy the centre and not the margin.

Morrison's communities of women, through their act of nurturing, help in restoring an off-centre individual to the centre. Thus Sethe, broken by the disappearance of Beloved, needs Denver, Paul D and the female community to heal her and restore her to wholeness and self-affirmation. With the loving care of Denver, the support of the community women and the concern of Paul D, she has to learn that she was her 'best thing'.

Whereas Alice Walker in her recent novels tends to take a radical Afrocentric feminist position, Morrison while advocating African cultural values is also conscious of the complexity of her situation as African and American and therefore explores the dynamics of culture conflict. The strong pull towards the dominant culture's commercial values is a major theme of *Tar Baby*. However, Morrison presents no viable alternative to the urban quest for upward mobility. The ending of the novel depicting Son running "lickety split" indicates his disentanglement from the *Tar Baby* but the composition of his briar patch is not revealed. Likewise, Jadine's destiny remains hidden. The open endedness of her novels like *Tar Baby* and *Song of Solomon* save her from falling into the trap of moralising or showing idealistic directions, and at the same time leaves the script open for the reader to make his own conclusions.

Questioning the compatibility of African-American self-expression and standard English, Morrison uses Black English for effective race representation. The language had to be true to her experience. To project a world-view that is distinct from the mainstream, she often takes recourse to black dialect. Black folk-speech used by her resonates with experience that is specifically Afro-American. In her hands language becomes a powerful tool in the construction of Black female identity. With the 'etymology of Africanism' she transcends the linguistic barrier arising out of gender and race difference. Hence expressions like "what you know good?", "This here Sethe..." "Don't eat no whites of eggs" place the text in a space that is different from the mainstream American writing. Language has power, and Morrison uses this power to her advantage.

The richness of *Song of Solomon*, *Beloved* and *Jazz* lies in the plurality of stories which together provide strength to the major issues incorporated in the novels. Anticipating a participatory relationship, Morrison endows her work with an oral quality. Hers is a conscious enterprise to sustain and evoke oral traditions which are a part of her cultural heritage. The text hence is not just a written product but a performance act which forcibly elicits response from the reader. Morrison writes into her narratives the "places and spaces so that the reader can participate". The oral mode she uses embodies a dialogic form inviting the reader to respond, to question and sometimes even to add his own script. In *Jazz* one wonders about the mysterious wild woman who was rescued by Golden Gray in a pregnant condition. After delivering the child, whom she refuses to nurse, she disappears again into the woods. Does she represents the agonised traumatised black woman who because of her inhuman degradations has become so psychologically fragmented that she has lost touch with reality? There is also the mysterious narrator of the novel. Is it the voice of the book? Or is it a disembodied griot articulating Black experience after slavery, the experience of moving to the cities which held out infinite possibilities?

Morrison evolves an African-American poetics by integrating oral tradition into the written. She thereby also preserves African oral literary and historical heritage. It is not without significance that Morrison's critique of historiography is presented through "speakerly texts".[21] The performative aspect of oral narration, which is as crucial as the story-telling itself, is built in through scenes like Baby Suggs' sermon at the clearing or the scene that recalls the murder of Beloved. Sethe's heart-rendering cry "No, No, Nono, Nonono" typographically evokes orality. One can almost hear the rising crescendo of 'No' as she pathetically tries to assert her agency over her children.

Morrison's tragic stories display the complex dimensions in which Black women's identity is structured and the way they negotiated or subverted their problematic position. She boldly subverts the traditional literary comfort of the reader who relies on Eurocentric literary tradition as she generates an African-American poetics from her specific socio-cultural milieu. Her writing, because of its orality, plurality of stories and the fusion of esoteric and material comes very close to the Indian Literary tradition. Morrison's work hence has an immense appeal to the Indian consciousness.

'The First Country of Socialism'

Parish Chattopadhyay

WE read with considerable interest Hiren Mukerjee's piece on the ex-USSR (*EPW*, March 26). His *playdoyer* for the ex-USSR has all the passion and rhetoric that this well known parliamentarian—perhaps the best the Indian communist movement has produced—used to marshall in his arguments in parliament. Mukerjee holds that "socialism" in the ex-USSR—the "first socialist country"—has "failed", after having succumbed to a "counter-revolution". Subject to "ceaseless, ruthless attack from the enemy involving immeasurable pain and hardship", the system, Mukerjee acknowledges, had many "limits" and "even crimes in policy execution". After all, "force as a factor of basic change cannot be wished away". It is, however, wrong on the part of the Left, Mukerjee opines, to forget the immense achievements of this "socialism" that, by "storming heavens", made toiling people into a "claimant to the Throne".

Admiring as we do his passionate defence of what he believes to have been the "first socialist country", we may be allowed to make a few observations in this connection. Our observations, let us add, will be entirely situated within a Marxian framework, employing the ideas and categories as they appear in Marx's (original) texts, even though the subject under study is eminently practical. This is, we believe, as it should be, inasmuch as not only the rulers of the ex-USSR claimed that they were Marxists, but also Mukerjee himself declares that he remains an "unrepentant communist".

The basic premise, on which Mukerjee's whole argument is based, is that the ex-USSR was "socialist", which of course "failed". Interestingly this is also the point of view of the bourgeois scholars and the world-wide bourgeois media. With us this very premise is in question. The spokespersons of the ex-Soviet regime of course asserted, at least beginning with the late 1930s, that theirs was a socialist regime, in the precise sense of, as Stalin put it, the "lower phase of communism". The whole communist movement, that is, the parties affiliated to the Third International, accepted this assertion axiomatically. The basis of this assertion was a double identity: *capitalist* ownership identified with *private* ownership (in the means of production), the latter identified with *individual* ownership. Thus the ex-Soviet spokespersons claimed that the juridical abolition of private ownership in the means of production and their transfer to the hands of the state and the collective farm meant the abolition of capitalism and *ipso facto* the establishment of socialism in their land. In other words, a change in the juridical *form* of ownership in the means of production was taken as a change in the (capitalist) *relation* of production itself. We submit that this is nothing short of standing Marx on his head.

Now Marx holds (1859, 1875) that ownership relations—by definition juridical relations—arise from and are an expression, but *not* the basis, of the relations of production. (Stalin argued the contrary in his "philosophical" discourse of 1938.) Secondly, within a particular ownership *relation* there could be different ownership *forms*. Private ownership as *individual* ownership is but one specific form of capitalist ownership relation, the initial form in which capitalist ownership appears (taking over this form from the pre-capitalist era). Marx shows at length, particularly in *Capital*, Vol 3, how, dictated by the needs of accumulation, bourgeois ownership form changes in course of capitalism's evolution, leading even to the "abolition (sublimation) of capital as private property within the capitalist mode of production itself". In the French version of *Capital*, Vol 1, Marx goes so far as to envisage the tendency of capitalist ownership to a *single* ownership over "total national capital" at a certain stage of capital's accumulation. Let us also note that in *Capital*, Vol 2, and later in his notes on A Wagner's "textbook", Marx posits "state" as "capitalist". Thus the juridical transfer of ownership of the means of production to the state has nothing to do with "social" or "socialist" ownership, as Stalin and his successors would claim it to be. "Social ownership" in Marx is simply direct appropriation of the means of production by *society* itself, constituting ownership relation under socialism, where, by definition, there is *no state*. Capitalism is *not* abolished and socialism is *not* established on the basis of the juridical transformation of (individual) private property into state (and "collective form") property—the basic rationale of Soviet socialism, summed up in Stalin's report on the 1936 Constitution. (This became the rationale of socialism with Stalin's successors as well as with the spokespersons of all the communist-ruled regimes till now and acccepted as such by "pragmatic" scholars and the uncritical partisans of these regimes in the world outside.) After all, as Marx observes, an old social order cannot just be "legislated away" (1867), and a new one is not ushered in by will, as something "arbitrary" (1857-58).

How, then, does Marx envisage socialism (which is the *same* as communism in Marx, the same society only passing through different phases)? Just as the essence of capitalism lies in "separation" (opposition) between the immediate producers and the conditions of production, in the same way the essence of socialism lies in the "union" of producers and the conditions of production, creating a "society of free and associated labour" (1857-58; 1861-63; 1865). It is a "union of free human beings, ...masters of their own social movement" (1867; 1857). Leaving behind the "pre-history of human society" (1859) people start here as "universally developed individuals whose social relations are subordinated to their own collective control" (1857-58). The capitalist society yields place to an "association" where the "free development of each is the condition of the free development of all" (1848). With "collective production" here, "the labour of the individual is from the start posited as social labour" (1857-58), and, naturally, any mediation of products of human labour by *commodity (money)* form is automatically excluded, just as *wage labour*, symbolising human servitude, ceases to exist. Similarly, this "free association" is absolutely incompatible with state, by definition a repressive machinery. (Hence "Socialist State" or "State Socialism" are contradictions in terms.)

It is immediately clear that socialism in Marx's profoundly emancipatory sense and "socialism" claimed to have been realised so far are disjoint sets: there are *no* common elements between them. Nay, even the stage that is supposed to immediately *precede*, and prepare the society for socialism—that is, the "proletariat organised as the ruling class"—was *never* realised in the post-1917 Russia (or anywhere else in the post-October period). The authors of "Great October" (Mukerjee) systematically undermined and ultimately destroyed the independent organs of self-rule created by the immediate producers of Russia on their own during the preceding eight months, the most important being the soviets and the factory committees. These authors indeed installed a dictatorship in the name of the proletariat. It was, however, a dictatorship not of the proletariat hut *over* the proletariat (and the peasantry)—a "jacobin dictatorship, a dictatorship after the bourgeois image", as Rosa Luxemburg so prophetically observed in her otherwise sympathetic appraisal of the Bolshevik endeavour (1918). It was an absolute monopoly of power not of the proletariat but of a self-recruiting, self-proclaimed "vanguard" over the heads of the labouring people and claiming to know and represent the interests of the labouring people better than these people themselves. A well known historian writes: "All power to the soviets' appeared to be a reality on the 26th of October, 1917, but it was mostly power to the Bolsheviks in those soviets. The procedures of parliamentary responsibility—of the cabinet to the central executive committee and of the latter to the congress of soviets and the electorate—lasted scarcely six months...Through the single-slate elections and the communist party discipline the whole system of soviets and executive committees was reduced to an administrative and propaganda auxiliary of the party... The promise of workers' control of industry... fell

by the wayside even sooner than the soviets. Deprived of power in the soviets and in the factories, the Russian proletariat found that the triumph of the dictatorship in its name was a very hollow victory" (Robert V Daniels) E H Carr, in his turn remarks that "the all Russian Congress of Soviets was reduced to a nominally sovereign body", that "central soviet organs and the local executive committees both ultimately recognised an authority outside the soviet system", and that the "ultimate power of decision rested with the appropriate party organ"

Mukerjee is right to refer to the plethora of ordeals, immeasurable pain and hardship" by the new regime But is it not rather odd that in a regime openly claimed as the one under the proletarian *class* rule, the 'poor harried Bolsheviks" *alone* and not the proletariat (and the poor peasantry) as the ruling class had to 'worry and wrestle over these problems as Mukerjee asserts? His assertion of course perfectly corresponds to what the leader of the Bolsheviks had said both before and after the Great October" In a famous justification of the Bolshevik monopoly of power he had asserted, on the eve of the seizure of power that if 1,30,000 landlords had been able to govern Russia, then so could 2 40 000 Bolsheviks of course in the interest of the poor and against the rich Shortly after the event he affirmed that we the Bolshevik Party, have conquered Russia from the rich for the poor from the exploiters for the exploited (that is not the poor or the exploited themselves) and added that we must now administer Russia consolidate what we ourselves have won Lenin s perfectly true statements demolish all pretension of the regime that the seizure (and administration) of power was an act of *self emancipation* of the Russian toilers—their class victory won by themselves and flatly contradicts Marx s famous statement, enshrined in the 'General Rules of the First International that the emancipation of the working classes must be conquered by the working classes themselves

Mukerjee is again absolutely right in insisting on force as a factor in basic change But who exercises force and against whom? Did the Russian proletariat itself adopt and impose upon itself the regime s measures directly taken from the arsenal of capitalist production, to discipline workers and raise labour productivity, such as, for example piece work, Taylor system, universal labour service, 'labour books" disciplinary courts? We have no such evidence While it is absolutely true that a proletarian regime just embarking on a long, tortuous journey towards a free society cannot dispense with all coercion, it must be emphasised that whatever coercion is required against the workers is the act of the coerced themselves, and not imposed on them by a body over which they have no control In fact, contradicting the emancipatory essence of a proletarian regime, there grew, on the morrow of the "Great October", a standing "red" army, with increasing induction of officers from the once hated (ex)Tsarist army, as well as a ubiquitous police as autonomous organs of repression instead of the toilers themselves being universally armed, and a bureaucracy (appointed from "above"), instead of all functionaries being freely elected and subject to recall at any time by the immediate producers themselves (In 1920 Lenin, flatly contradicting what he had repeatedly said and written before October stressed that "all this shout against the appointees, all this old and harmful trash which (still) finds its place in different resolutions and talks must be swept aside ")

When the supposed proletarian dictatorship supposedly yielded place to socialism the latter turned out to be the exact opposite of a "society of free and associated labour' as Marx had envisaged it In this supposed "lower phase of communism" (Stalin), the state—by definition a repressive apparatus—with a huge standing army, police—open and secret—and a monstrous all-pervading bureaucracy—incompatible even with the proletarian dictatorship—continued to be strengthened and showed not the faintest sign of any tendency to 'wither away', in Engels s celebrated expression This repressive apparatus was of course presided over by the party (leadership)—standing above and completely autonomised from the soviet immediate producers—with all the effective levers of power concentrated in its hands All the important office holders in the soviet economy and polity, far from being universally elected and subject to recall by citizens were the party nominees through a system directly taken over from the Tsarist table of ranks the so-called *nomenklatura*

On the other hand, as the state was completely autonomised in relation to the immediate producers the so called public property in the means of production simply signified the *non property* of those producers over the means of production the juridical fiction to the contrary notwithstanding At the same time the immediate producers were totally excluded from all decision-making concerning what one could consider, following O Lange as the fundamental elements characterising the "planning and effective direction of the economy", namely the division of national income between consumption and accumulation, the distribution of investments among different branches of the national economy and co ordination of the activities of these branches In a word the producers had no say on what how and for whom to produce

For most of the 'socialist' period the workers non property in the means of production went hand in hand with their *separation* from the conditions of production at the level of the individual commodity producing units of production In other words, the industrial workers continued to be *wage labourers* under socialism" However in this "lower phase of communism", between the late 30s and early 50s, these workers were also subject to non-economic constraints (besides the economic constraint imposed by wage labour), such as "labour books", legal prohibition from leaving jobs, severe penalties for absenteeism, compulsory transfers for the skilled workers—leaving aside the question of 10 to 15 million prisoners, at various times, working from inside the labour camps (Precisely during this period when, according to Stalin, the "exploitation of person by person" had already been "abolished", Stalin's man L Kaganovich thundered to the labourers—lucky enough to work in factories and not in labour camps—that the "earth should tremble when the director is entering the factory ") Again, there is no evidence that these constraints were self imposed by the workers

The situation of the immediate producers in agriculture was worse The collective farm labourers were for a considerable period, subjected to compulsory corvees like road building and timber cutting—which did not apply to the city dwellers—and, in the words of an undisputed authority they were subjected to a labour system which reminded them of conditions from which the revolution seemed to have redeemed them forever"(M Lewin), and, indeed for a long time, they were legally tied to their work place The apparently co-operative and democratic principles enunciated in the collective farm charter were of course pure fiction Here too, it was the party state that exercised effective control "from above

However these predominantly extra-economic constraints on the immediate producers were limited to a particular, relatively short period of soviet 'socialism" For the greater part of the period the immediate producers basically remained *wage labourers* (in the specific Marxian sense of the term) Indeed it can be shown, rigorously employing Marx s categories and his materialist method, that this supposed 'lower phase of communism" was really a specific type of *bourgeois* regime (specific in relation to the so called classical bourgeois regimes) where, in Marx's paraphrase of Ricardo means of production employed the labourers labourers did not employ the means of production We desist from undertaking this exercise here for lack of space (We have developed the argument at length in our book *Marxian Concept of Capital and the Soviet Experience. Essays in the Critique of Political Economy*, Praeger 1994)

From the point of view of the immediate producers it seems now in retrospect, that the "Great October" instead of inaugurating a revolution to create an emancipated, completely de-alienated 'society of associated labour', rather turned out to be the starting point of a counter-revolution in the precise sense that it not only negated the revolutionary gains that the Russian workers and peasants had won *on their own*—as "heaven stormers", like the Parisian workers of 1871—during the previous eight months but also destroyed any possibility that those gains contained towards the birth of a genuine 'Republic of Labour" (Marx) in the future However, "all things are contradictory in themselves", as Hegel would say This counter revolution engendered its own contradictions which, increasingly insoluble, enmeshed the regime and ultimately engulfed it

SCHEDULE 17—NOTES TO ACCOUNTS

1. PRINCIPAL ACCOUNTING POLICIES

1.1 General

The accompanying financial statements have been prepared according to the historical cost convention, except premises of the bank which have been stated at revalued amounts. They conform to generally accepted accounting principles and to the practices prevailing within the banking industry in India.

1.2 Foreign Currency

a) Assets and liabilities in foreign currencies, except deposits from Non-Residents held under Foreign Currency Non Resident (A) and (Banks) schemes, are translated into Indian Rupees at the rates notified by FEDAI as at the balance sheet date. Resultant gains or losses are taken to the profit and loss account. Transactions during the year are converted into Indian Rupees at the rates current on the date of the transaction. The balances held under Foreign Currency Non Resident (A) Deposits scheme are valued at the rates specified by the Reserve Bank of India from time to time, whereas, balances held under Foreign Currency Non Resident (Banks) Deposits scheme are stated at the rates at which they were originally sold, with the costs of forward exchange cover for such deposits being spread over the period of the contracts.

b) Contingent liabilities in respect of Forward Exchange Contracts are included at contracted rates.

c) Outstanding Forward Exchange Contracts are revalued at the rates notified by FEDAI as at the balance sheet date in order to account for the financial effect thereof.

1.3 Investments

a) Investments in Securities approved for the purpose of maintaining Statutory Liquidity Ratio requirement:

i. Permanent Investments

These are valued at the cost of acquisition. The difference between the cost of acquisition and the maturity value of each security is amortized/accrued over the residual period to its maturity.

ii. Current Investments

These are valued at the lower of cost of acquisition and market value. Treasury bills are valued at cost of acquisition and the difference between the cost of acquisition and the maturity value is amortized/accrued over the residual period to maturity of the Treasury bills.

b) Other Investments

These are valued at lower of cost and market value. The cost for this purpose is the cost of acquisition and, in the case of Commercial Paper, includes discount which is accrued over the residual period to its maturity.

1.4 Fixed Assets

Fixed Assets are stated at historical cost less accumulated depreciation, except premises, which have been revalued on 31st March, 1993, and are stated at their market value determined by a firm of valuers. The surplus arising on revaluation has been credited to Property Revaluation Reserve Account.

1.5 Depreciation

Depreciation on the fixed assets of the Bank is provided on the straight line method and on those of Travel Related Services (TRS) division, as per the written down value method. The rates of depreciation are as prescribed by Schedule XIV to the Companies Act, 1956, except for Furniture & Fixtures in the case of the bank, and Leasehold Improvements in general, where higher rates have been adopted in accordance with their useful economic lives.

1.6 Advances

Provisions for doubtful advances have been made to the satisfaction of the auditors in respect of identified advances based on a periodic review of advances and after taking into account the portion of advance guaranteed by the Deposit Insurance and Credit Guarantee Corporation, the Export Credit and Guarantee Corporation and similar statutory bodies.

1.7 Income Recognition

Interest income is recognised on an accrual basis except in the case of non-performing advances, where it is taken to the Profit and Loss statement on collection.

1.8 Staff Benefits

Provisions for gratuity and pension benefits to staff have been fully made on the basis of actuarial assessments.

1.9 Provision for Taxation

Provision for taxation has been made based on the 'liability method' of accounting which is generally followed in India.

1.10 Net Profit

The net profit disclosed in the Profit and Loss Account is after:-

a) the effect of revaluation of "investments" (see paragraph 1.3 above)

b) provisions for doubtful advances (see paragraph 1.6 above).

c) provision for taxes on income in accordance with statutory requirements.

d) other usual and necessary provisions.

ISSUE HIGHLIGHTS :

1 Well established profit making dividend paying company

2. Diversified product profile —
a) Electronics
b) Air Conditioning & Refrigeration
c) Auto Components
d) Food Products
e) Chemicals

3. Project
a) to manufacture FR4 Grade Glass Epoxy Copper Clad Laminates, core material for Electronic Industry
b) foray into Chemicals - manufacture of Anionic surfactants to cater to ever growing detergents and personal care products Industry
c) to improve and expand existing range of Carburettors, Water Pumps and Fuel Pumps.

4 Technical collaborations
a) with Nationwide Circuit Products Inc., U.S.A., for copper clad laminates
b) with Chemithon Corporation Inc. U.S.A for manufacture of Anionic Surfactants and
c) with Solex, France and Puralator Inc., USA for Auto Components

5 Thrust on Exports a) Copper Clad Lamination project under EHTP Scheme. Buy back arrangements with the collaborators
b) Anionic Surfactants under EPCG Scheme. Firm tie-up for exports

6. Easy liquidity - listing at Bombay, Madras and Ahmedabad Stock Exchanges

"INVESTORS MAY NOTE THAT IN CASE OF OVERSUBSCRIPTION, THE ALLOTMENT SHALL BE ON PROPORTIONATE BASIS"

RISK FACTORS :

INTERNAL

1 Statutory clearances for EHTP, EPCG Schemes yet to be obtained
2 Clearance from TNEB for power supply and from Pollution Control Board yet to be obtained
3. The proposed projects are in the early stage of implementation. Any, delay in the implementation may affect the future profitability.
4 The market acceptance of surfactant chemicals will depend on the quality of the products which is yet to be established by the company
5. The present market price per share is on cum bonus basis and the shares arising out of coversion of FCBs being issued on rights and to the public are not entitled for the already declared bonus shares

EXTERNAL

1 Exchange rate fluctuations will have an impact on profitability as the major raw material requirements are imported
2 Competition from already established manufacturers both domestic and international

PERCEPTIONS OF THE MANAGEMENT FOR THE RISK FACTORS

INTERNAL

1 Applications have already been submitted. No difficulty envisaged in obtaining approval for EHTP and EPCG Schemes
2 No difficulty envisaged in obtaining approval from TNEB and Pollution Control Board
3 Management is confident of implementing the project as per schedule and hence do not foresee any deviation in the projected profitability.

EXTERNAL

1 Export earnings will compensate adequately the effect of Exchange rate variation
2 Firm buy back arrangements for all the Projects. The technology adopted are state of the art and meets international quality requirements

If the Company does not receive the minimum subscription of 90% of the issue amount including devolvement of underwriters within 60 days from the date of closure of the issue, the Company shall forthwith refund the entire subscription amount received. For delay beyond 78 days, if any, in refund of such subscription, the Company shall pay interest as per Section 73 of the Companies Act 1956.

Carrot and Stick

A number of important markets have today come to be dominated by speculative forces: for example, the market for foreign exchange and the stock market. Rather than attempting to reintroduce controls, say, on international capital flows, there is a lot to be said for getting some agreements on 'Pigovian' carrot and stick measures. 2490

Limited Vision

The government's lack of foresight on Kashmir must be entirely blamed for the emergence of militant organisations like Harkatul Ansar which holds the prospect of mindless violence of a kind one sees in Afghanistan. 2465

Unempowered

To those who drafted the national population policy currently under discussion, women's empowerment is a conveniently progressive-sounding phrase; for, the general thrust of the policy is to devalue women and their rights as individuals. 2470

Calculated Misreading

The current restlessness in the plains of Uttar Pradesh is centred more on the general education-employment situation though the anti-reservationists are trying their best to divert it into other channels. 2467

Fate of Forests

The state's persistent efforts to deny the adivasis of Jhabua in Madhya Pradesh rights to the forest has resulted in an ongoing conflict that today constitutes the biggest obstacles to forest conservation. Only if people's rights are respected can forests be preserved. 2493

While the current forest bill is ostensibly conservation-oriented, it does not address the needs of the people living in and around forests. 2473

Chinese Boom

How successful has China's much maligned one child policy been in curtailing the country's population growth? 2502

Despite the implementation of one of the most rigorous and compulsory population policies in the world, China's population has grown; but so has its standard of living. In fact, its population growth is the most vivid mark of the success of the government rather than its failure. 2486

Nuclear Market

With its vast army of retrenched army personnel, laxity of government controls and general chaos, Russia has become a fertile ground for illegal trade in nuclear defence materials. 2479

Celluloid Links

S Satyamurthi, the nationalist leader, played an active role in establishing a unique interaction between the theatre and film world and political life in Tamil Nadu. 2482

Integrating Immigrants

The emergence of young, second generation immigrants of Algerian origin on the French public scene since the early 1980s raises a number of issues concerning their integration into French society. 2476

Fiscal Exercise

Should any capital receipt be taken into account in the calculation of fiscal deficit? The continuing debate. 2507

Puzzling

The comparative silence of the opposition parties on the issue of the Maharashtra chief minister's misdemeanours is puzzling. 2468

Absence of Policy

Unfilled reserved posts in Osmania University sparked off dalit protest. But there is more to the issue than seems to be. 2475

Kerala Model Scrutinised

AT the recently concluded International Congress on Kerala Studies in Thiruvananthapuram, the main subject of debate and discussion was the so-called Kerala model of development. Under this model the state made marked advances in social services, advances which got reflected in the state's remarkable achievements in regard to what have commonly come to be referred to as quality of life indices. At the same time, however, the state has been lagging badly behind in terms of economic growth and its unemployment and underemployment have reached levels which would be considered unacceptable by any standard.

E M S Namboodiripad, the congress president, set the tone of the discussion when he urged: "let not the praise that scholars shower on Kerala for its achievements divert attention from the intense crisis we face—we can ignore our backwardness in respect of employment and production only at our own peril". Namboodiripad made no secret of his own feeling that "while we have spent much time and attention on 'social sector' issues of welfare and the improvement of the living standards of the people, we have not paid enough attention or shown adequate concern for pressing problems of economic growth and material production".

The debate and discussion revolved around two questions: (1) Does it mean re-ordering the priorities in Kerala's development away from social services; would not such re-ordering mean eventual loss of the gains the state had achieved in terms of the quality of life indices? (2) If however there is no re-ordering of priorities, given that the state's economy is virtually stagnant with the state material production base having to support a still increasing population and provide employment to a still multiplying labour force, will it anyway be possible for the state's economy to sustain the pursuit of its social goals?

Not that there was any unwillingness to deny the existence of the constraints which a stagnant economy imposes. In Kerala's case large-scale migration of workers almost all male, did provide some respite from these constraints. But there was certainly a strong feeling of unease at any suggestion that advances in social services already achieved may have to be forgone, even though a careful reading of the presidential address and several other addresses and papers would show that none went so far as to suggest forgoing gains already made. What was being asked was whether or not in the future development of the state, greater attention should be paid than in the past to facing the economic issues; a question that, in any case was inescapable, given the impasse that the state of Kerala had reached already.

A Reader

Thiruvananthapuram

Improving Performance

PRAJAPATI TRIVEDI on 'Improving Government Performance' (August 27) is not accurate in concluding that 'what gets measured, gets done'. One may have to write another article to point out the weakness of the Economic Administrative Reforms Commission report. The fact that nothing tangible seems to have been done to increase the accountability of government officials and departments is solid evidence that those who accepted the report very intelligently realised that the report provided an escape route and it would be useful because L K Jha commission enjoyed the support of the political authority.

What we have in the government system dominated by rigid bureaucracy is the policy of error avoidance. This kills the spirit of dynamism necessary to accomplish an important objective or mission. The government system stresses efficiency while in the developing economy the important point is effectiveness. The result one might have seen is that on many important development issues and programmes, the performance might have appeared efficient but not effective. Poverty and population have increased against all efforts to control these two issues.

The yardstick used to measure the success of any vital programme is linked to the amount spent. The result is that government departments appear in a hurry to spend before March 31 and in this process wasteful expenditure is incurred. Those who cannot spend the budget are blamed while the fact may be that they have saved public money from going to waste. One big reason for poor performance of the government is that it is not functioning as an integrated monolithic unit. Many ministries, expected to co-operate, are often seen as being at loggerheads and in their desire to establish their supremacy they inadvertently destroy the objectives of a mission.

Another reason is that the government has not succeeded in establishing confidence and credibility in those who are governed by their rules and procedure. Even when the rate of inflation is going up, one might hear an official proclamation that it is going down. Many may be killed in a train accident, but reports would give a false figure. Why? The government since 1982 has invented methods of announcing policy on every important aspects affecting the public. Unrealistic targets are fixed and powers have been concentrated in one person known as HOD/secretary/cabinet secretary. Unless decentralisation on a mass scale is carried out, I doubt if accountability can be imposed.

ECONOMIC AND POLITICAL WEEKLY

Monetarist Gospel

IF one has immense faith in one's own gospel, everything falls neatly into place. The Reserve Bank of India's latest *Annual Report* for 1993-94 is a classic case of being carried away by one's own logic, even though the logic is simple-minded and faulty.

What does the RBI seek? The community must grant it a clear and unambiguous mandate for the achievement of price stability and for this mandate to be carried out, there should be freedom and autonomy for the central bank to decide how much government paper it wishes to hold. Different arms of economic policy have different responsibilities, with price stability being the overriding objective of monetary policy. With the clear enunciation of such a single-minded task, the central bank of the country will then establish neat statistical relationships between output prices and money—as it has done in a clear and unequivocal articulation of the 1994-95 monetary policy, which was to bring about a 4 percentage point reduction in inflation rate consistent with a real income growth of 5 per cent—the objective being to contain M3 growth within a range of 14 to 15 per cent. And to contain M3 growth, the system of automatic monetisation had to be phased out—as the government has agreed to do in a period of three years. The entire perspective that the Reserve Bank has brought to bear on the developments in the Indian economy during the past 10 years and on the policy spheres is guided by this nakedly monetarist framework. Not surprisingly, the Bank's *Annual Report* not only presents a superficial reading of economic recovery, but lacks consistency.

The autonomy that the RBI is seeking for itself is in an extremely narrow construct of being able to conduct monetary policy as part of stabilisation policy. The *Report* argues that reform measures have begun to yield results in terms of improved economic growth, which may be true, but there is sufficient reason to believe that the quality of growth leaves much to be desired, and that public policies are not inducing higher saving propensity amongst households so that an enduring external balance can be achieved. In the growth process, the commodity-producing sectors unlike the financial and service sectors are taking a back seat. And within the commodity-producing sectors, the output structure is increasingly moving in favour of elite goods. Such developments have significant implications even for the demand for bank credit and its productive use. True autonomy for the central bank would mean that it could impart a degree of independent judgment on issues of such vital importance. Apart from an unequivocal claim of higher economic growth, the *Report* echoes the government's perception of taxation reforms and the fiscal deterioration during 1993-94. There was scope for the Reserve Bank to distance itself from the government's view in this respect and argue that surrendering of vast tax revenues through premature tax reductions was responsible for the fiscal malaise. The RBI believes that stabilisation and structural adjustment policies have the basic thrust of improving productivity and efficiency of the system and of instilling a greater degree of competitiveness. But what about their implications for employment growth and for the availability of social infrastructure for the poor, let alone for an egalitarian socio-economic development?

This decidedly narrow perspective is further evident in several interpretations and analysis of various developments presented in the report. For instance, commenting approvingly of a strong reserve build-up which is said to boost international confidence in the economy and would lead to growing internalisation and openness, the report glibly argues that the country's present reserves, though large, appear modest compared with that of many other developing countries. That these countries built up reserves after their basic balance of payments situation had improved and after they had begun to attract substantial foreign direct investment of a productive nature—and not foreign investments of a portfolio nature in share markets which are more expensive than debt—appears to have escaped the Bank's notice.

The report claims that the progressive opening up of the internal sector and the swelling of capital inflows are a result of its prudent monetary management. The Bank cites the rise in the ratio of net foreign assets (NFA) to currency during a period of increase in the NFA as being reflective of prudence in such monetary management. According to the *Report*, a rise in the ratio indicates that in the event of a reversal of the capital inflow there will be sufficient foreign exchange reserves to meet the outflow when it does take place. *Per contra*, a fall in the NFA/currency ratio in the face of rising NFA would suggest that the reserves would be insufficient to meet the eventual cycle of a drawdown of NFA, as such a drawdown would be larger if the currency of expansion is excessive. This claim of prudent monetary management is indefensible both on factual and analytical grounds. First, to an extent, the rise in the ratio of NFA to currency, particularly, that between March 1991 and March 1992 and between March 1992 and March 1993, is statistically attributable to the depreciation of the external value of the rupee. Secondly, accumulation of NFA far beyond the rate of expansion in currency may imply severe recessionary conditions in the Indian industry resulting in both reduced import and reduced credit demand. In fact, the RBI certainly cannot claim the benefit of prudence in monetary management on this count because its own policy of capital adequacy for banks and such other norms had created sufficient disincentive for banks' commercial lendings. Finally, if currency expansion was contained relative to the expansion in NFA it was also because the RBI lending to government was replaced—in a sense more than proportionately—by commercial bank lending to government. In turn this was made possible first, because the banks were flush with funds, and second, they preferred investment in government securities.

In the same vein, the RBI's other claims are also open to question. In the *Annual Report* it claims to have achieved

significant success in open market operations through the sale of government securities from its own account (Rs 9,047 crore during 1993-94) and states that not only was RBI credit to government contained at a low Rs 260 crore during 1993-94 but that in the current financial year (up to August 19, 1994) the outstanding level of *ad hoc* treasury bills declined by Rs 5,305 crore in contrast to an increase of Rs 16,290 crore in the corresponding period of the previous year. All these have, after all, been made possible because commercial and co-operative banks' credit to government galloped from Rs 13,547 crore during 1992-93 to Rs 26,697 crore during 1993-94 or from Rs 6,791 crore in the first quarter of 1993-94 to Rs 13,939 crore during the first quarter of 1994-95.

Apart from the fact that both large foreign exchange accruals following portfolio investment inflows and the reluctance on the part of the commercial banks to expand bank credit are attributable to inappropriate policies, a basic question that should be posed before the RBI, in the context of the monetary developments during the past two years— for which the Bank claims credit— is whether it is immaterial (a) how much the central government borrows from the market so long as it borrows at market rates of interest, and (b) whether the fiscal prudence adopted by the government should be determined only on the basis of the gross fiscal deficit to GDP ratio or whether the gross fiscal deficit (GFD) should be judged in relation also to aggregate expenditure of the government. The sustainability of the deficit, as also the inflationary implications of government borrowings, will depend upon not only the GFD to GDP ratio, but also the size of the deficit in relation to the government's overall expenditure size as well as the composition of total expenditure. The RBI takes great pride in having facilitated the government's borrowing of mindboggling sums of money during the last two years because, first, it has been from the market and second, it has been at market rates of interest. But the fact that this borrowing has been entirely for financing the expansion in the government's current expenditure has not dawned up on the RBI. Therein lies the rub—for, its infatuation with crude monetarist policies, has blinded the central bank of the country to ground realities.

PHARMACEUTICALS

Distorted Priorities

THE union government has announced what it chooses to call the drug policy. The document is in a way futuristic—it generously accommodates the interests of the drug industry, especially laying out the red carpet for pharmaceutical multinationals, and in its anxiety to satisfy all sections of industry, reverses every step that had been taken in the past to ensure the availability of medicines to the people. And in that sense, the government has kept its oft repeated promise to the industry that the new drug regime would be more in keeping with the rest of the liberalisation moves and the changes ensuing the signing of GATT recommendations. Almost all sections of the industry, Indian, big and small, and the multinationals are unanimous in their approval of the direction the policy is taking in reducing the price control basket. Significantly, the media, unlike the last time a drug policy was announced, appears to have universally ignored the opinion of the drug consumer movement.

As expected the policy limits price control to only 73 drugs from the current 143 and the span of control is brought down from 70 per cent to 50 per cent. In general drugs with an annual turnover of over Rs 4 crore would be under price control. The 'competition' criteria has also been included: if there are five bulk drug manufacturers and 10 formulators with no single unit having more than 40 per cent of the retail market, the drug may be out of price control, but a strict watch will be kept on the prices. All drugs under price control will enjoy the maximum allowable post-manufacturing expense (MAPE) of 100 per cent. Most importantly, industrial licensing for bulk drugs has been abolished bringing the industry on par with the other sectors. Five bulk drugs as well as those using recombinant DNA technology and specific cell/tissue targeted formulations will however, still require licensing.

While the merits and demerits of this regimen are no doubt going to be discussed in great detail, two facts stand out clearly. First, that the department is no longer paying even lip-service to the concept of essential or necessary drugs. The criteria are entirely decided by market forces. Second, in its anxiety to keep all sections happy over price control, the department may well have caught itself in a bind. For instance, while the logic of using market and industry criteria for determining the content of the price control basket has always been assumed to result in controlling the prices of essential and necessary drugs, the result of the policy, observers point out may well be the opposite—that some generally used essential drugs may fall outside price control, and inessential and irrational products like multivitamin tonics may come under it. Moreover, there is rampant confusion about the nature of the price control basket because of the several possible interpretations one may give to the policy recommendations.

The policy also announces the setting up of two independent bodies: the national drug authority (NDA) and the national pharmaceutical pricing authority (NPPA). The first will be responsible for monitoring standard practices in drug promotion and drug usage and will be responsible for the preparation of the national formulary. The NPPA will oversee the enforcement of the provisions of the Drug Price Control Order. The former, it may be recalled, was first recommended by the many committees and consumer groups have repeatedly sought to have it established. The 1987 policy did elaborate on the setting up of the NDA, but little progress has been made on that count. Moreover, given the trend of the policy, the noises being made about the importance of the NDA are obviously crumbs being thrown to the consumer lobby. While there is no disputing the fact that such a body is necessary, it has no role in a regimen where essentiality is defined in terms of the profitability of the industry. The NDA should have come into being before the price control basket had been decided upon. Moreover, how will the NDA, ill-funded and with little infrastructural support as it is bound to be because of the low priority it will be accorded, counter the drug industry's mammoth resources which it employs to ensure that even the most inessential drug has 'scientific' validity?

Then again, not so very long ago, soon after the 1987 policy, an international forum of independent experts had painstakingly formulated a graded essential drug list which the department undoubtedly has access to. It would hardly be necessary for the NDA to undertake that exercise once again unless, of course, other factors such as the industry's profitability are to be kept in focus. It is well to remember that all the might of the various technical advisory committees has not been able to make the government move to ban irrational pharmaceutical products. Curiously, the policy entirely ignores the existing drug control machinery which could have done with badly needed upgradation. How on earth does the policy seek to ensure quality drugs, especially now with delicensed production, with the existing poor infrastructure for quality control?

The policy's proposal to levy a cess on pharmaceutical products to create a fund to be utilised for strengthening the drugs standards organisation at the regional and sub-regional levels and to facilitate R and D, should be viewed in the background of the experience that the government has had in extracting anything from the industry. This cess, for instance, was introduced more than two decades ago and subsequently abandoned because it failed to yield any funds. The experience of trying to make the industry cough up under the Drug Price Equalisation Account, in the recent past, is yet another failed experiment. In truth, the pharmaceutical industry in India, which was one of the first third world countries to set up a manufacturing base in pharmaceuticals, and produced a document like the Hathi committee report which has been an inspiration to countries like Bangladesh, has grown to be so enormously influential that it has become futile to represent people's interest to the government on this issue. If essential and necessary drugs are to be made available to people, the current spawning of the pharmaceutical industry has to be checked.

UTTAR PRADESH

All Pop and Fizzle

WHILE the pressure, by the UPCC(I) headed by N D Tiwari, on the AICC(I) to withdraw support to the state government continues apace, it has lost much of its steam and may soon fizzle out The verdict of the Supreme Court on the violent incidents on the premises of the Allahabad High Court on September 13 during the bandh called by the ruling SP-BSP combine, after the CBI has investigated the case, is unlikely to come to the rescue of the PCC, for a number of senior Congress(I) members have already come out against adopting the course urged by the former Prominent among these are the chief ministers of the states going to the polls in the coming months, one of which is Andhra Pradesh, the home state of the prime minister

Opinion in certain quarters has condemned the bandh call given by the SP-BSP combine on the plea that agitational actions by the ruling parties are violative of the norms of political behaviour While these quarters need to be lauded for raising the issue of political norms in the prevailing atmosphere, agitational action by the ruling groups has already become an irreversibly entrenched norm of our political vocabulary The ground on which the ruling combine needs be criticised therefore is that it failed to ensure that the bandh went off peacefully especially when one objective of the bandh was to protest against the violent agitation of the previous weeks instigated allegedly by the opposition parties

In this context while the CBI is investigating the Allahabad High Court incident and the Supreme Court would pass its verdict on it in due course—likely to be, in all probability, nothing more than strictures against the Yadav government—the violence that occurred during the bandh, nevertheless, was still not such that a case can be made out for the dismissal of the UP government

What the bandh has actually achieved, therefore—and what was its main objective—is to show that the SP BSP combine enjoys a large measure of support in the plains of UP This means in *real politikal* terms that by withdrawing support to the Mulayam government, or by dismissing it on constitutional grounds, the Congress(I) would be jeopardising its own immediate future in the state Alternatively, what is at stake is only the political future of the current PCC(I) chief, N D Tiwari The position that leading members of the central Congress(I) leadership have already taken on the issue has made it clear that they are indifferent to the fate of the latter No wonder then, that to press his case he has now set his eyes on the expected Supreme Court judgment on the Allahabad High Court incident

CRIME

Towards Globalisation

HISTORY, pronounced dead five years ago by the Japanese American Francis Fukuyama is, it seems taking revenge by its rebirth of a sort in the US itself The vehicle of history this time, however is not class struggle, but mafia violence Another irony is that while Fukuyama's heroes had supposedly ended History by raising the banner of free market power in the nerve-centre of class ideology, that was the Soviet Union, today Russia is repaying its debt by implanting a new mafia power in the US when, thanks to the heroic efforts of some of the Italian justice officials the Sicilian mafia appears to be on the run both in its original homeland as well as its country of adoption

According to a DPA despatch from New York dated September 8 an official advertisement in a Russian language American paper recently carried this official ad Anyone with information or just rumours on the Russian mafia, please contact the New York FBI office They are dangerous and we want to prevent them from getting established like the Italian mafia before them says the New York FBI chief William A Gavin, concludes the DPA despatch The immediate cause of the official concern appears to be the gunning down of an *emigre* Russian in a Russian neighbourhood in New York which synchronised with an attack on this victim s brother in Berlin the same day This was not a pure coincidence but likely to have been a result of rivalries among mafia groups according to FBI investigators As is by now well known thanks to Hollywood the godfathers power is consolidated only by inter-mafia violence

During the last 20 years of the cold war and its immediate aftermath about 2 00 000 Russians have migrated to the US with the American authorities blessings Now the "FBI would like to have about 2 000 of them behind bars as they are hardened criminals who would shrink from no crimes'

If it was the US s exertion that had brought 'freedom to the shackled Russians, the Russian mafias are now perhaps seeking some 'freedom' to strike roots in the US Moscow perhaps is repaying some part of its debt through this export! This is also an extension of the cherished globalisation, indeed its integral part If transnational integration of business and culture is a law of globalisation, then crime which itself is a big business and interlinked with other business enterprises and politics cannot escape globalisation A further proof is provided by the fact that the US Ku Klux-Klan is reported to have been providing finance to the rising neo Nazi groups in Germany

POPULATION MEET

Poor Impact of NGOs

Ravi Duggal writes

THE International Conference on Population and Development (ICPD) turned out to be more a conference on religion and abortion While in the Bucharest and Mexico conferences there was only a South North divide—the former block supporting the thesis that development is the best contraceptive and the latter's concern mostly with the population bomb in the third world—at Cairo religious sentiments have been brought to centre stage The Vatican supported by a few predominantly Catholic (Nicaragua Guatemala Argentina etc) and Islamic countries has taken the lead in diverting the debate from the main issues as laid down in the Preamble (Article 1 7) greater investment in people and a new action agenda to make women full partners with men in the social economic and political lives of their communities It must not however be forgotten that it was the US which really started this ball game kicked by the pro life and religious groups there Subsequently the media had a field day in highlighting the Catholic and Islamic points of view which ultimately hijacked the conference

While at the official forum the progressive delegates could not be openly critical about the unnecessary involvement of religions in the population and development debate the NGO forum delegates could express themselves more freely Many NGO women delegates from Latin American countries were ashamed of their governments stands The Latin American Women s Health Network meeting emphasised that the ICPD Action Plan must respond to the reality in Latin America so that abortions are not done in risky conditions They urged ICPD to endorse safe abortion and contraception as a right as also providing sex education to adolescents

The NGO forum was only partly affected by the official forum s obsession with abortion This was largely because of the wide-ranging themes which were being discussed there The NGO Forum had slated about 600 meetings over eight days with 10 15 meetings taking place simultaneously during each time slot The largest attended and perhaps the most interesting were those of the Women s Caucus and Women's Environment and Development Organisation (WEDO) where discussions centred around women's health and reproductive rights Some efforts were also made to link up with overall development issues

A number of sessions listed on the environment and development issues did not take place because speakers/panelists failed to turn up. The Environment Caucus was poorly organised and failed to make any impact. Similar was the fate of the South-South Caucus which was to focus on development issues of the South and lobby in the official forum. Its strong appeal for discussing the unsustainable consumption in the west went unheeded.

Nevertheless the NGO forum played a useful role. On the one hand it provided opportunities for those who did not have accreditation to attend the official forum to get information on what was happening there and on the other hand, armed with this information, the NGOs could create opinion on various issues and lobby the official forum both through accredited NGOs as well as through official delegates, many of whom were even attending the NGO forum.

India was perhaps the only major country which did not have NGO representatives as part of the official delegation. This was not only taken as unkind by the Indian NGOs but many of the official delegates and NGOs from other countries were surprised. However, the Indian official delegation compensated by holding daily briefings and dialogue with Indian NGOs. It surprised many that this turned out to be one of the best open forums during the ICPD. The secretary, family welfare, Shunglu briefed the NGOs on daily happenings and carried a fruitful dialogue with NGOs on tackling various sticky issues. This became a fairly effective lobby. The consequence was that India's stand on development and women's health issues turned out to be by far the most progressive. For instance, India took the lead in emphasising that reproductive health, family planning, abortion, etc, should be the right of an individual and not necessarily delimited to married couples.

Even though in terms of members the third world countries dominated the NGO forum, NGOs based in the west were calling most of the shots. One group of NGOs from the west were the Malthusian institutions like Population Council, International Planned Parenthood Federation, Population Action International, etc, and another were the progressive ones like Physicians for Social Responsibility, Centre for Women Global Leadership, International Women Health Coalition. However, it was interesting to note that even in these institutions Asians, Africans and Latin Americans were quite active. One thing one has to learn from the west is the way they organise themselves, and it is all decided beforehand who attends what meetings and how reporting, networking, lobbying, etc, will take place. Of course, it is ultimately a question of resources and access to information which makes possible all that organisation. Viewed in the overall context the NGO forum, though a little disorganised, did make a positive contribution, especially the support it provided to progressive official delegates in countering the impact of the religious fundamentalists.

US IN AFGHANISTAN

Tragic Backlash

THE recent report of the US-based Human Rights Watch, which squarely blames Washington for the flow of arms to the terrorist groups in Punjab and Kashmir, underscores the tragic backlash of the US misadventure in Afghanistan in the 1980s, which continues to bedevil the subcontinent.

In its fanatic opposition to Soviet domination in Afghan politics in those days and taking advantage of the divisions within the Afghan communist ruling powers, Washington rushed headlong into a disastrous exercise—all in the name of making Afghanistan 'safe for democracy'. It picked up an assortment of disgruntled Afghans—feudal landlords, Islamic 'mullahs' and members of the criminal underworld, who felt threatened by the land reforms and socio-religious changes initiated by the communist regime, and were spoiling for a show-down with the new rulers who were dispossessing them of their traditional authoritarian powers. An equally militarily impetuous Moscow aggravated the situation by marching its troops into Afghanistan to quell the rebellion by the so-called 'mujahiddins'—initially a ragtag of these feudal tribal landlords and their musclemen, but later emerging into a well-organised army (of both mercenaries and nationalist-minded Afghans provoked by the atrocities of Soviet troops)—fed by a regular flow of sophisticated weaponry from Washington and military training by its satellite state in Islamabad, which sheltered the Afghan rebels in camps in the border town of Peshawar.

As happens with all short-sighted and opportunist strategies, Washington's game did lead to the exit of the Soviet military-supported regime in Kabul, but it has left the Afghans today with a tottering regime run by Washington's erstwhile proteges who are fighting among themselves with the same arms that the US provided them for use against the communists and the Soviet troops. The violence—triggered off by Washington's generous arms supply—is no longer confined to Afghanistan, and has spilled over to Pakistan and India. The Pakistan authorities are at their wits' end trying to control the drug pushing and depredations by marauding gangs of Afghan mercenaries in Peshawar, and the outflow of Kalashnikovs and other lethal weapons from their arsenal to politically explosive areas like Sindh. In India, these arms have found their way into the hands of the various militant groups in Punjab and Kashmir. Some among the Afghan veterans (along with their compatriots from other Islamic states) who had fought the Soviet troops, and now left without any similar cause for a 'jihad' in Afghanistan, appear to have discovered a richer pasture in Kashmir for investing the surplus from their arsenal, as evident from their presence in the Valley in recent months.

The Human Rights Watch report recalls the US intervention in Afghanistan (through the CIA supply of arms to its mercenaries, based in Pakistan) which aggravated the tensions in the subcontinent. As far as Afghanistan is concerned, instead of being able to 'establish democracy' there, the US intervention has led to a state of permanent warfare there, driving into exile (in India and other places) thousands of disillusioned Afghans who, during the communist regime at least enjoyed some sort of security and democratic rights—in the form of land for the landless (under Decree 8) and liberalisation of marriage rules for women (under Decree 7). While both Washington and Moscow have now washed their hands off Afghanistan (after having triggered the conflict there), the US-backed Islamic fundamentalist groups who have come to power in Kabul—who, to start with, never had any political programme for building up their society—are today dragging Afghanistan into a violent civil strife.

As for the fall-out of the CIA's Afghan misadventure in the subcontinent, the Human Rights Watch report blames Washington for ignoring the siphoning off of US weaponry (meant for the Afghan mujahiddins to fight their Soviet enemies—and sent through the Pakistan government) by Pakistan's Inter Service Intelligence to anti-Indian militant groups in Kashmir and Punjab. The report adds: "The deliberate efforts by US to evade responsibility has also been an element contributing to abuse."

Today, however much he may try, Clinton cannot absolve his administration of the responsibility (undertaken during the cold war period) of promoting a wide variety of reactionary terrorist groups—ranging from Zionists to Islamic fundamentalists, from White racists to tribal xenophobics in Africa. They are now coming home to roost. In a desperate effort to introduce and maintain the 'New World Order' in the third world countries, the Clinton administration appeals to—and if necessary enforces—their governments to come to terms with their internal enemies. Its intervention in the Palestinian dispute, in South Africa—and now in the Kashmir imbroglio—in the role of peace-maker, stands out in sharp contrast not only with its past role in instigating these conflicts, but also with its present policy of allowing its military-industrial complex to continue to supply arms to the contending forces in these countries of the third world. Before advising India and Pakistan to solve their dispute, Clinton should muster his guts to force his military advisers to stop arms sale to these countries. Once they are starved of the continuous arms flow and defence agreements (that promise them newer and newer weapons) neither New Delhi nor Islamabad can continue for long the policy of mutual belligerence by depending solely on their respective indigenous sources of conventional weapons.

Tourism Finance Corporation

PROMOTED by IFCI along with other all-India institutions and nationalised banks, the Tourism Finance Corporation of India (TFCI) was set up five years ago as a special all-India financial institution to cater to the long-term credit needs of the tourism industry. TFCI has been financing both conventional and non-conventional tourism projects like hotels, restaurants, holiday resorts, amusement parks, safari ropeways, parks, air taxi services, tourist emporia, and sports facilities which have importance for developing tourism but which are not eligible for institutional finance. Tourism being one of the major foreign exchange earner, the department of tourism, government of India, has launched a national action plan for stepping up the country's tourist arrivals from 1.8 million to 5 million by the end of the century. With this target in view necessary investment in infrastructure is being undertaken. TFCI being the uniquely placed financial institution for this purpose, is to play a crucial catalytic role and hopes to have a tremendous growth potential. To part finance the future requirements of the funds for the tourism sector and to widen the shareholders base of the company, TFCI is for the first time entering the capital market on September 26 with 170 lakh equity shares of Rs 10 each for cash at a premium of Rs 20 per share aggregating Rs 5100 lakh. TFCI enjoys the advantage of being a member of the Over-the-Counter-Exchange of India (OTCEI) and also a SEBI authorised category I merchant banker. The lead managers to the issue are Punjab Capital Services and Reliance Capital and Finance Trust.

Dolphin Offshore Enterprises

Dolphin Offshore Enterprises is engaged in providing a variety of services like diving services, marine operations, geophysical and geotechnical surveys, and ship-repair services. It operates six offshore vessels and two dynamically positioned vessels for ONGC and foreign-going cargo ships. The company has technical collaborations with Global Marine Drilling Services, USA, Oceaneering International, Switzerland, TL Geotechnics (Singapore), and Geodetic Construction and Survey, Switzerland. The company has shown rapid progress during the past five years with the turnover crossing Rs 32.82 crore and profit after tax Rs 96.54 lakh in 1993-94. As a part of its programme expansion plans the company proposes to acquire an offshore utility vessel, a ship repair unit for undertaking repairs and upgrading its self elevated barges for soil investigation. To part finance these, it is entering the capital market on September 28 with a public issue of 14 lakh equity shares of Rs 10 each for cash at a premium of Rs 30 per share aggregating Rs 560 lakh. The total cost of the project is Rs 770 lakh of which Rs 560 lakh is being raised through this public issue and the balance of Rs 210 lakh is being funded by NCDs. The issue is jointly lead managed by Creditcapital Finance Corporation and Punjab and Sind Bank.

Southern Latex

Southern Latex, a Madras-based company, promoted by S Meghanathan, G Kumaresan and Nirmal Joseph, is engaged in the manufacture of rubberised coir products. The company, to part finance its expansion plan, is entering the capital market on September 19 with a public issue of 29,19,200 equity shares of Rs 10 each for cash at par aggregating Rs 292 lakh. The capital raised will be used to double production capacity and also for the setting up of finishing facilities to enhance value addition. The company has an advantage where availability of raw materials is concerned, because rubber latex and coir fibre are not affected by climatic conditions and are available throughout the year. Moreover, since it is an agro-based company, it enjoys sales tax and excise duty concessions. The company proposes to commence commercial production of finishing facilities, as also of the enhanced capacity by the end of January 1995. The lead managers to the issue are SBI Capital Markets and Foresight Financial Services.

Mirza Tanners

Mirza Tanners, in operation for 15 years, has 50 lakh sq ft of tanning capacity and also integrated facilities for 4.5 lakh pairs each of shoe uppers as well as shoes. The company is now proposing to set up a new unit with a capacity of 6 lakh pairs of shoes; it is also planning to expand and modernise its tanning unit. The total project cost is placed at Rs 12.57 crore of which the public issue will finance Rs 10 crore and internal sources Rs 2.57 crore. The public issue will be of 10.20 lakh equity shares, at a premium of Rs 88 per share of Rs 10 each. Interestingly, the promoters will be holding 75 per cent of the post-issue equity and of this, 70 per cent is reportedly based on bonus issue.

Samtex Fashions

Promoted as a 100 per cent export-oriented unit for men's formal suits and trousers, Samtex Fashions (SFL) has a technical collaboration with Samsung conglomerate of South Korea and also a marketing tie-up for 40 per cent of annual sales with Roger Beryl Corporation of US for three years. A 100 per cent EOU has to attain a minimum export of 75 per cent of its annual production.

The total project cost, appraised by IDBI in November 1993, is placed at Rs 12.60 crore comprising Rs 3.35 crore for plant and machinery, Rs 1.67 crore for building, Rs 1.04 crore for technical know-how, Rs 1.68 crore for miscellaneous fixed asset and Rs 1.68 crore for preliminary and pre-operative expenses. The project financing patterns are as follows: Rs 6.90 crore of equity of which Rs 3.40 crore are from promoters, Rs 2.98 crore as foreign currency term loan from IDBI; and Rs 2.72 crore of rupee term loan from IDBI and other institutions. Of the total issue of 34.1 lakh equity shares at Rs 10 each for cash at par, 18.60 lakh shares are offered to the Indian public, 4.65 lakh shares are reserved for NRIs, 4.6 lakh shares for mutual fund and 6.2 lakh shares for FIIs. The project has high profile financing pattern and also hopes for diversified sources of public subscription. But though India has done well in the garment export field, considering the inadequacy of experience in the world garment trade, the promoters themselves may face stiff competition from China and Taiwan which have acquired tremendous expertise in marketing upper segment-oriented wool/blended suits and trousers which SFL would like to focus on. Also, the project cost is said to be excessively high. The issue is to open on September 22.

For the Attention of Authors

The compulsion to limit the size of issues on account of steeply rising newsprint and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

Burgeoning liquidity in the banking system accompanied by further high levels of equity prices has been a conspicuous aspect of the financial market developments particularly during the past one month. While bank deposits have risen by Rs 3,739 crore, commercial bank advances and investments together have risen only by Rs 509 crore, thus leaving a surplus of as much as Rs 3,230 crore (or 86 per cent of incremental deposits) for additional CRR (roughly about Rs 1,000 crore) and for the bank to play around with in treasury management. At the same time, the BSE Sensex has attained repeated peaks during the period, 4,588 on August 31and 4,618 on September 16; over the past two-month period, Sensex has risen by about 500 points or over 12 per cent. On the inflation front, the annual rate based on WPI has no doubt fallen for the eighth week in succession.

GREAVES

New Product Lines

GREAVES, a 135-year old engineering company, formerly known as Greaves Cotton and Co, of the Thapar Group, has shown good performance for the year 1993-94. Its net sales have increased by 14 per cent due to rapid increase in selling commission, etc (from Rs 29.10 crore in 1992-93 to Rs 38.15 crore in 1993-94). In a competitive environment the company has faced a reduction in operating profit by 5 per cent. This has, however, not affected its net profit which went by 24 per cent because the company's non-operating profit has shown a 49 per cent rise. The company has done well on the export front though the global market remained sluggish and uncertain. The company's exports have gone up by 44 per cent to Rs 30.18 crore. Though imports of merchandise were Rs 14.04 crore in 1993-94, the total foreign exchange outgo was of the order of Rs 48.15 crore. The company's debt-equity ratio has come down by more than 50 per cent in the past two years (from 55 per cent in 1991-92 to 25 per cent in 1993-94). The company has announced a dividend of 28 per cent which is 2 percentage points higher than that declared in 1992-93.

The company has added two major product lines to its operations, viz, three-wheeler autorickshaws and ABS/HIPS resins. The powertransmission unit at Falta, West Bengal, has done well. The company acquired 70 per cent of assets from Enfield India (Thoraipakkam and Ranipet, Tamil Nadu) as part of its expansion programme. It had originally planned to manufacture light diesel engines at Aurangabad, but has now shifted the manufacturing venue to Ranipet and accordingly investments are being made there. The company has acquired controlling interest in SIDVIM, AG, an internationally recognised trading company situated at Vaduz, Liechtenstein and having offices in Moscow and Alma Aty, Kazakistan. The company has entered into a joint venture agreement with a few parties in Singapore for trading in Vietnam and other countries. The company is also registered in Singapore as Pacific Greaves. During the year the company disinvested its 50 per cent holding in Greaves Foseco, a company dealing in metallurgical chemicals. The three-wheeler-diesel autorickshaw is a successful innovation by the company's research and development department.

INDIA PHOTOGRAPHIC COMPANY

Non-Operating Profit

India Photographic, a subsidiary of Kodak, manufactures cameras and trades in photographic and allied products like films, paper and plates, chemicals, photographic instruments and apparatus. With the passing on of the benefit of the reduced customs duty to customers, the company has adopted an aggressive marketing strategy to increase its market share in some of its speciality products. Net sales went up by 34 per cent in 1993-94 but, as a result of more than 40 per cent rise in the cost of materials used, operating profits declined by 56 per cent. But this has been more than offset by the rise in non-operating profit as a result of sale of land and building at Prabhadevi in Bombay for Rs 11.75 crore. The company has also received an earnest money deposit of Rs 10 crore for the agreement to sell its Kodak House situated in Fort, Bombay, for Rs 40 crore. Tax provision has also been lower at Rs 60 lakh against Rs 96 lakh in the previous year. As a result, net profits rose from Rs 8.9 lakh to Rs 379 lakh for 1993-94. The company has announced a dividend of 30 per cent. It has not been exporting any goods, but has been earning foreign exchange (Rs 1.48 crore during 1993-94) through commissions and other earnings. The company's foreign exchange outgo has galloped from Rs 39.27 crore in 1992-93 to Rs 72.14 crore in 1993-94.

Amongst its new projects, the company is implementing its finishing project at Goa, which when completed, will have the benefits of sales tax exemption for 12 years and income tax exemption for five years. The company's plant at Malanpur for manufacturing photochemicals commenced commercial production in August 1993 for which also the company will enjoy sales tax exemption for seven to nine years

BHARAT FORGE

Financial Services and Real Estate

Bharat Forge, a leading manufacturer of forgings and crankshafts, has faced severe recessionary conditions after 1990-91 and experienced a steady decline in its sales turnover for the past three years. To an extent this has been compensated by larger earnings from the company's financial services, which are reflected in a significant rise in the other income (from Rs 8.59 crore to Rs 13.33 crore, and also non-operating surplus from Rs 11.15 crore to Rs 12.16 crore). The rise in other income has helped to improve its overall operating profit by 37 per cent for the year 1993-94. Likewise, the company's net profit has also increased by 58 per cent, despite increases in interest burden and depreciation by 28 per cent and 18 per cent, respectively. The company has announced a dividend of 30 per cent as against 20 per cent in 1992-93 and 33 per cent in 1991-92. The company's debt-equity ratio has risen from 125 per cent to 132 per cent. Exports declined by 17 per cent for the year, attributable to letters of credit not being opened in Ukraine against an agreed contract of Rs 159 crore and the continuing recessionary trends in western and Japanese markets.

The company has obtained the ISO 9002 certification. Its project at Kuruli in Pune district for the manufacture of wheel rims for heavy and light vehicles under technical collaboration with the German Lemmerzewerke is likely to commence commercial production by the end of June 1995. The second area into which the company has diversified its financial services where it claims to have done exceedingly well. It now plans to start merchant banking services. It has as many as seven subsidiaries all of which are in the finance area: Bhalchandra Investments, Mundhawa Investments, Forge Investments, Chakrapushpa Investments and Finance, Starflower Investments and Finance, Jalakamal Investments and Finance and Jalakumbhi Investments and Finance. The company has also diversified into real-estate development.

KIRLOSKAR OIL ENGINES

Higher Sales and Profit

Kirloskar Oil Engines (KOEL) of the Kirloskar group, the largest bimetal manufacturer in the country, has shown good performance for the year 1993-94 with sales going up by 29 per cent. The company's operating profit and net profit have gone up by 28 per cent and 84 per cent, respectively. There has been a drastic cut in tax provision by 95 per cent, and dividend has been maintained at 25 per cent. The company's profit margin measured by gross profit on sales, though generally low at about 7 per cent, has shown a steady improvement. The debt-equity ratio has come down from 136 per cent in 1992-93 to 94 per cent in 1993-94. Exports slipped from Rs 15.43 crore to Rs 11.00 crore. Last year the company had the distinction of bagging the Export Excellence certificate.

The company is setting up a power house for electricity generation at the site of Kirloskar Ferrous Industries at Munirabad in Raichur district of Karnataka. Kirloskar Pielstick diesel generating sets would be used to generate power and the plant capacity would be 9 MW. The company has set up a private limited company, Kirloskar Deutz Sales and Services, as a

joint venture project with equal participation by Deutz Motor Industriemotoren GmbH (DMI) of Germany; it has begun co-ordinating engine export activities. Kirloskar Kisan Equipment (KKE) is a wholly-owned subsidiary of the company, which is now being revived. KKE has ventured into consultation in, and erection of, post-harvesting agricultural equipment. KOEL has also taken over the management of the Prashant Khosla Pneumatics, a sick company having facilities for manufacture of diesel engine components. The company has incurred an expenditure of Rs 99 lakh for research and development which is low compared to last year's figure of Rs 135 lakh. Because of its own R and D the company claims to have fully absorbed the foreign technologies it has imported during the past five years for diesel engines and noise and emission control.

UNION CARBIDE INDIA

Living Down Bhopal

Union Carbide India (UCIL), a subsidiary of Union Carbide, (UCC) US, is trying to live down the history of Bhopal gas tragedy and achieving expanded business activities. It registered a rise in net sales by 11 per cent in 1993-94, while operating profits and net profits increased by 42 per cent and 20 per cent, respectively. The increase in net profits has occurred after provisioning for increases in taxation and depreciation. The company has raised its dividend by 5 per cent, from 20 per cent in 1992-93 to 25 per cent in 1993-94.

The company is a major producer of dry batteries, and now with the liberalisation policy permitting import of the product at reduced customs duties, it will have to face stiff competition. However, the recessionary phase for dry batteries seems to be over and demand has picked up. The company's two plants are facing problems due to ongoing wage negotiations, though at the battery plant at Cossipore, Calcutta, a productivity-oriented wage settlement has been signed. Operations at the plant in Srinagar could not be resumed due to the prevailing political unrest.

Apart from dry batteries, the company produces flashlights, photoengraver plates and electrolytic manganese dioxide. While sale of carbon was the same as in the previous year, that of industrial electrodes was 23 per cent lower. The company, in a joint venture with Germany's Henkel Products, has been marketing the premium detergent Henko.

On government petition, the Supreme Court has directed that a fund of Rs 65 crore be earmarked for a hospital to be established at Bhopal for the gas tragedy victims and UCIL's contribution has been fixed at Rs 7.5 crore. Incidentally, the Rs 120 crore worth equity shares held by the Union Carbide, US, and attached by a Bhopal magistrate can now be sold by the escrow-agents (SBI and Credit-Capital Finance) appointed by the Supreme Court subject to approval by government of India. The company with the consultancy of National Environmental Engineering Research Institute is cleaning up the equipment and plant site at Bhopal.

The company is now planning to expand its activities in the dry battery and flashlight areas with products of advanced technologies. A loan of Rs 3.45 crore was obtained from the IDBI for under its equipment finance scheme for modernisation of one of the company's battery manufacturing facilities. Natex Marketing is a wholly owned subsidiary of the company and Nepalese Nationals a joint venture with Nepal Battery Company. The company invested Rs 151 lakh in research and development in 1993-94.

NDA SECURITIES

NSE Membership

An existing profit-making company and a category III merchant banker registered under SEBI, NDA Securities has applied for upgradation of its status to category I. The company was recently granted membership of the National Stock Exchange in the capital market segment which is expected to give a fillip to the groups' share broking and investment activities. The company has been active in the areas of underwriting and investment business since getting SEBI registration in this January, in addition to being associated with a few public issues as advisors to the issue. The company declared a maiden dividend of 6 per cent in the very first year of operations and for the 11 months ended February earned a net profit of Rs 25.8 lakh on a gross income of Rs 69 lakh.

Kashmir: At the Edge of the Possible

Gautam Navlakha

The emergence of the militant organisation Harkatul Ansar holds the prospect of mindless violence of a kind one sees in Afghanistan, but the blame for this must rest squarely on the government, on its total lack of foresight. The only ray of light in Kashmir has been the manner in which the people were able to force the government to back down on the Hazratbal shrine issue. It is as though in their political mission, the Kashmiri people are beginning to push at the edge of the possible.

FRENCH journalist and diplomat Eric Rouleau once disclosed that when Charles de Gaulle's advisors suggested that he negotiate with an Algerian moderate and not the FLN he replied that to forge lasting peace you had to negotiate with those who were firing on your soldiers; you did not negotiate with those with no blood on their hands because they were irrelevant. Five years down the road with the full might of the Indian security forces unable to effect the capitulation of the militants, the chances of peace returning to Jammu and Kashmir appear remote. True, the militants cannot defeat the Indian army and a war of attrition has ensued with each side trying to wear out the other. However, the fact that the militants have been successful in thwarting the mighty Indian forces and in bringing about a stalemate reveals the government's weakness. In such a situation for the government to refuse to negotiate with those demanding the right of self-determination is merely the flip side of its policy of trying to batter a whole people into submission. The blame for the absence of any political moves has been laid at the door of the Kashmiris, with a section in the government insisting that crushing the people is the only way out, another saying that partners for a dialogue are not available, and yet others urging that the government should have nothing to do with those described as fundamentalists or pro-Pakistanis.

Indian commentators have highlighted the internecine conflicts among the militant groups. JKLF leader Yasin Malik, after his release on bail, had gone on a hunger strike in May last demanding an investigation into the killing of innocents, merger of the 70-odd militant groups into three major groups, an immediate end to extortion and return of Kashmiri pandits to the valley. There were allegedly two attempts on his life by Hizbul Mujahideen militants. Again, there was the allegation by Ikhwan ul Musalmeen against Hizbul Mujahideen of having killed its leader Qazi Nissar Ahmed, the Mirwaiz of southern Kashmir, on June 19 for having publicly criticised Harkatul Ansar, a militant outfit comprising foreigners, for abducting two Britons on June 7 from Pahalgam. There is also growing concern among the people at the presence of foreigners over whom no one but Pakistan's ISI appears to exercise any control. For instance, until July all militant organisations opposed the lifting of the ban on the Amarnath pilgrimage unless the government removed the bunkers around the Hazratbal shrine. But when the government was finally compelled to remove the bunkers, Harkatul Ansar remained adamant in its opposition to the Hindu pilgrims going to Amarnath. And the appeal of Hizbul Mujahideen and Hurriyet Conference to Harkatul Ansar to give up its opposition was turned down. In fact Harkatul Ansar disregarded the plea of even Abdul Qayoom Khan, prime minister of so-called Azad Kashmir. All this does give the impression that with no one in control, the possibility of a dialogue is dim.

There was some short-lived euphoria at the release of Yasin Malik in May and the expectation that the JKLF would now be able to reassert itself, that the Hurriyet Conference could be split, and that it might be possible to force a Mizoram-type solution eventually. In Delhi's political circles there was talk of elections in which JKLF would be allowed to win and come to power and then be compelled to crack down on the other militants. This, it was further claimed, would make the JKLF lose popularity and pave the way for the re-emergence of a National Conference government, with or without the Congress. What fed the rumour mills was also the statement of a Hurriyet leader, Moulvi Abbas Ansari, at the so-called Nimrana initiative, a non-official Indo-Pakistan Conference sponsored by the Ford Foundation on May 27-28, while that the people of Kashmir would not settle for anything less than self-determination, they did not want to accede to Pakistan. Ansari added that 'Azaadi' could mean complete independence or independence within India. This was wrongly seen as an admission of weakness, whereas Moulvi Ansari was only re-stating the principled stand of the Hurriyet.

That the government did expect some political advantage from releasing Yasin Malik was clear from the fact that the prosecution did not oppose his bail plea before the TADA court in Delhi. But in the byzantine world of Indian politics and the confusing mix of agencies involved in Kashmir, the release of Yasin Malik was followed by the arrest of Moazzan Ali, leader of Al Barq, JKLF leader Javed Mir Nalqa and Ahsan Dar of Muslim Mujahideen, a breakaway faction of Hizbul Mujahideen, nullifying any benefit the government may have been hoping for by releasing Yasin Malik. In fact the systematic decimation of the JKLF and militants espousing 'Azaadi' never stopped. In a little noticed incident on August 19, JKLF lost out to Hizbul Mujahideen in its endeavour to regain control over Hazratbal. With Hizbul establishing its hold over the shrine, the ideological battle also seems to have gone against the JKLF. Speaking before an 80,000 strong congregation, Hizbul condemned the JKLF for its "Gandhian policies and for bargaining over martyr's blood" and reiterated its determination to bring about an "Islamic order in Kashmir". Indicative of the changing ground reality, JKLF was forced to appeal to Pakistan to help its ailing leader, Yasin Mailik, get treatment in England for his serious kidney ailment.

But the over 10-month-long stand-off between the government and the Kashmiri people has also added a new dimension to the political articulation by the people. People of the valley do not any more pay taxes and the local authorities have stopped collecting bills for electricity and municipal services. The combination of militant action with civil disobedience, public demonstrations and hunger strikes is truly significant. Notwithstanding the internal contradictions, this variety of action has put the Indian forces in a quandary. They may be adept at dealing with people wielding guns, but are at a loss when confronted with peaceful forms of protest. The people's victory over Hazratbal also points to the political relevance of the Hurriyet Conference, a representative body of more than two score militant and political organisations, including the JKLF and Jamaat-i-Islami.

Hurriyet's Consolidation

The recent developments surrounding the Hazratbal shrine have helped the Hurriyet Conference to consolidate its role as a representative body of the people and the divergent militant and ideological groups. While the government conceded the popular demand for removing the bunkers around the shrine when JKLF leader Yasin Malik went on an indefinite fast, it botched up things by first talking of 'relocation' and even this was passed off as a concession to the government's current favourite. Hurriyet stuck to its stand that bunkers had to be 'removed' and that the modalities for handing over the shrine

to the Muslim Auqaf Trust could be worked out only with its support. The state administration was compelled to accept the demand and appointed a new chairman of the Auqat Trust, G G Draboo. Hurriyet played a central role in the restoration of the shrine, especially in assuring the public that the relic was intact. Having done that, it was the appeal by Hurriyet calling off opposition to the Amarnath Yatra—and not the JKLF which, unlike in previous years, could not offer any guarantee of the safety of the pilgrims—which carried weight. What also added to the Hurriyet's credibility is that it did not allow the government to drive a wedge between it and the JKLF by carrying the latter along in the restoration work and later by stepping in when it appeared that Hizbul and JKLF may fight it out within the shrine precincts for control and insisting that they leave their weapons behind. This is not to imply that the battle to control Hurriyet has ended. On the contrary, it may become more intense. But a lot depends on the government's response. If the approach is to discredit and destroy Hurriyet, then we must be prepared for a step-up in violence.

It is true that unabated violence has already dislocated Kashmiri society and for this the militants, especially Harkatul Ansar, cannot escape blame. But the major factor in the induction of violence into every home and family in Kashmir has been the operation of the Indian security forces. The manner in which militancy reached the Jammu region once again provides evidence of how the government allows a situation to deteriorate with total unconcern for the people. Trouble in Doda in the Jammu region began on April 23, 1993 when two Muslim young men were shot dead by the BSF during Ramzan. BSF officers admitted that the jawans were at fault, but refused to initiate any action. Two months later, on June 26, 1993, three Muslim government employees, all junior engineers, were picked up by the BSF and tortured to death in custody. Once again the guilty men escaped punishment. During this period the BJP stepped up its agitation for arming its cadres and handing over Doda to the army. In the ensuing vacuum Harkatul Ansar was able to step in. On August 14, 1993 they intercepted a bus, singled out Hindus and killed all 14 of them. On December 17, 1993 six Hindus were killed and beheaded. Such incidents were repeated on May 21 and 30 and June 6 this year when militants attacked and killed, among others, local BJP leaders in Doda. This triggered off the first direct confrontation between the two communities in which 44 houses and a mosque and a temple were burnt down with neighbours exchanging gunfire. In other words, what could have been nipped in the bud was allowed to simmer and be used by Harkatul Ansar for its own ends, setting off a chain of events which finally saw the migration of people from Doda into Chamba with the prospect of violence now reaching Himachal Pradesh.

Multiplicity of Agencies

To a certain extent the multiplicity of agencies involved and the problems of co-ordination among the various security forces queers the pitch for the government. Apart from the number of security agencies and intelligence outfits and special task forces, many other agencies exist in the union home ministry. For instance, an eight-member team of secretaries headed by K R Venugopal, secretary in the prime minister's office, was set up a few months ago with the intention of enabling the prime minister to have an independent source of information and therefore decision-making on Kashmir. The effectiveness of the body remains to be established. There is, within the home ministry too, a special consultative body comprising non-officials. Apart from this the joint army, paramilitary and civilian 'screening committees' set up to identify and separate militants from the innocents in detention has been unable to function due to the 'big brotherly attitude' of the men in uniform towards the civilian members. And in Doda, army-BSF co-ordination suffered because the BSF was piqued at its senior officer having to report to an army officer ranked below him.

An instance of how problems get complicated was seen in the delay in decision-making to remove the bunkers from around the Hazratbal shrine. A decision on the bunkers could have been taken way back in October last year when the siege was lifted. It was evident that the bunkers only antagonised the public and got linked to the Amarnath pilgrimage, thus feeding communal hostility. What the government has done now, by unconditionally removing the bunkers, is what the people had been demanding for the past 10 months. The delay only fuelled popular alienation and brought no benefit to the government. Finally, the prime minister had to intervene and lean on a reluctant governor who even faked a tooth ailment to delay arriving in Delhi before the decision could be announced. Against this background, the setting up of a new force called the India Security Force to tackle insurgency in Jammu and Kashmir with 40 battalions makes little sense. A touch of farce is added when it is declared in all seriousness that this force will ease the pressure on the army and go some way in solving the unemployment problem in Kashmir.

In a bid to project transparency in its handling of Kashmir, the government thought of allowing foreign teams access to Kashmir. It was felt that this would enable it to manage the flow of information. Thus the International Commission of Jurists was given red carpet treatment when it arrived in India. But now it is being accused of deviating from its 'brief' when it questions the accession of Jammu and Kashmir to India. The experience with three ambassadorial teams did not similarly prove successful. Whereas the envoys from the European Union were favourably impressed, considering their own governments' preoccupation with Islamic fundamentalism, those from the OIC were vocal in questioning the propriety of an Indian government spokesperson briefing the media on their behalf. And the ambassador of Iran to India pointed out that the promises made by the Indian government had not been fulfilled.

Hope and Despair

The emergence of Harkatul Ansar, beholden to none in the valley, holds the prospect of mindless violence of a kind one today sees in Afghanistan. As it is, normal life in Kashmir has been disrupted beyond recognition and violence is all-pervasive. Indian observers are fond of attributing all this to the involvement of Pakistan and the ISI. But just as the Russian invasion of Afghanistan paved the way for the emergence eventually of leaders such as Gulbuddin Hekmatyar in Afghanistan, the militaristic approach of the Indian government in Kashmir may result in the proliferation of Hekmatyar clones there. For this state of affairs the responsibility rests squarely on the government. A total lack of political foresight and even enlightened appreciation of self-interest has guided Indian policy in Kashmir. Consider, for instance, that even many less dogmatic elements in the government support a policy of extending support to the JKLF because it is considered the lesser evil and it is held that an independent Kashmir is better than one which accedes to Pakistan. This is justified in the name of some higher political morality of opposition to fundamentalism. In this scenario, where the Kashmiris are sought to be saved from themselves lest they fall prey to the forces of fundamentalism, the people become invisible even as the government 'sincerely' searches for dialogue partners.

In sum, then, since the Indian army cannot defeat militancy and because the government is not trying hard enough for a political solution, not even when political openings come its way, and with involvement of international agencies being increasingly perceived as the only way in which the Indian government can be dissuaded from persisting with its militaristic response to what has been and remains a political problem, the prospect of peace without the association of Hurriyet to work out the framework and modality of a referendum remains remote. The one ray of light has been the manner in which the Kashmiris forced the government to back down on the issue of the Hazratbal shrine. It is as though in their political mission the people are beginning to push at the edge of the possible.

Reservation Is Not the Issue

Amaresh Misra

Despite the strenuous attempts of the Congress and the BJP to make repeal of the 27 per cent reservation for backward castes into a general issue in the state and thus unleash widespread caste conflict, the movement has not caught on in the plains.

EVEN before completing one full year in office the SP-BSP government is facing a severe test. Its move to implement 27 per cent reservations in education and employment has backfired in the hill districts of Uttarakhand where the situation is very different from that in the plains. Backward castes there comprise only 2 per cent of the population and the reservation policy holds out the threat of dominance from the plains. In a region already marked by a history of movements on the issue of separate statehood (centring on the real grievances of regional backwardness and identity) this could only add fuel to fire. As it is, right after the assembly elections there were signs of growing restiveness in the hills and all political parties, from the SP to the BJP, had stressed the hills' demands in their political agenda.

Anti-reservationism *per se* does not constitute the real essence of the movement. This is highlighted by the poor response the movement has evoked elsewhere. Despite the strenuous attempts of the Congress and the BJP, backed by a section of the press, to make repeal of the 27 per cent reservation for backward castes a general issue in the state and thus unleash widespread caste conflict, the movement has not caught on in the plains. In fact, in the hills the movement has been on the demand for separate statehood and for a reservation policy which takes into account the peculiarities of different regions. It has been argued by democratic opinion that if in states like Tamil Nadu and Karnataka the reservation quota can be raised to suit their social specificities, the same logic can be applied in reverse to Uttarakhand. Since all the parties, including the SP, are agreed on the demand of a separate statehood, policy matters such as reservations can be kept in abeyance till Uttarakhand state comes into being or some special status is granted to the region.

But what the movement has also revealed is the real face of leaders like Mulayam Singh who shed their democratic veneer the moment they encounter a mass movement of any variety. A couple of months back when employees in the state power sector looked all set to go on a massive strike against privatisation, the chief minister had answered with the extreme threat of clamping TADA on the employees. He did not also hesitate to try to divide the workers on caste lines. The same techniques are in evidence in his handling of the Uttarakhand agitation. At one level, the chief minister began by granting 2 per cent reservation to people from the hills, by passing a resolution for a separate state in the state assembly and by promising to fill class 3 and 4 jobs in the region from within the area itself. On the other hand, he issued a warning to the agitators that he was not dependent on the people of Uttarakhand for support; this was followed by a massive crackdown and by manoeuvres to split the movement.

The result was police brutality and the killing of agitators in Nainital and Mussoorie on the one hand and on the other stage-managed events like the meeting of SP student leaders from Uttarakhand with the chief minister and the 'calling off' of the agitation. The killings themselves were no simple result of a clash between the police and the agitators. According to an investigation team of the CPI-ML (Liberation) which toured the area from September 1 to 7, the movement was also directed against some local liquor manufacturers who are SP supporters. Even earlier the Uttarakhand movement has targeted liquor contractors who are associated in the region with outside attempts to despoil the area. The coming to power of Mulayam Singh has seen a spurt in the award of contracts to the liquor mafia, reversing the success of a series of anti-liquor movements in the late 80s and early 90s. In addition, a new element has entered the picture in the form of builders as part of the state government's so-called efforts, to boost tourism in the area. This has been seen as a threat to Uttarakhandi identity and culture. The forest mafia too has started baring its fangs. Of late crimes linked to these elements have increased in the region and armed liquor contractors roaming about freely have become a common sight.

During the current movement, the growing police-mafia-SP-BSP nexus has come directly under attack. The police inspector who masterminded the firing in Khatima is known to be closely linked with a liquor manufacturer, Kulwant Singh Chaddha, who is an SP supporter. Reports about the crowd turning violent were all fabricated. The state intelligence department has confirmed that the PAC personnel manning the area had not received any bullet injuries. The three wounded personnel were all members of the UP police under the direct charge of the above inspector who is said to have deliberately engineered the whole episode in order to justify the police firing on unarmed and peaceful protesters. Till date there has not been a single incident of violence by the demonstrators. In the Mussoorie incident too a major role was played by a mafia figure, Garibdas, who is close to D P Yadav, the notorious west UP don and SP leader. On September 2, the day of the firing, only a handful of protesters were squatting at a place called Jhoolaghar as most of the inhabitants of the town had left for Pauri to attend a rally. On September 1, Garibdas had arranged for the transfer of inspector Prakash Talan, who was close to him, to Mussoorie. The Deputy Superintendent of Police, Uma Kant Tripathi, had opposed the transfer. Tripathi was gunned down by police bullets. He lay wounded for half an hour at the spot but was not attended to. The Mussoorie incident has been reported in all its gory detail in the Hindi daily *Jansatta*. It appears more and more as part of a cynical game of the chief minister to justify repression in the name of a conflict between hills and plains on the issues of reservation and a separate state, even as his party continues to pay lip-service to the latter cause.

But all these efforts have not succeeded in subduing the movement. Despite occasional lulls, the movement shows no signs of abating, but has in fact acquired a spontaneous dimension, bordering on a 'people's upsurge' with nearly all sections of the population—employees, traders, students, professionals and so on—throwing in their lot. A major element has been the participation of women on a scale not seen since the days of the independence struggle. Gatherings of a 20,000-30,000 are taking place at short notice and, contrary to all reports about the preponderance of the Congress and BJP, the movement is almost totally in the hands of non-party forces. These forces have a broad democratic orientation and, in marked contrast to the anti-reservation movement of 1990, there have been no attacks on the dalits and backwards. The latter too have not exhibited any animosity towards the movement. The Congress, BJP and even the UKD have failed so far in taking the movement in their grip. In many places BJP leaders and MPs were greeted with garlands of shoes and the students have made it a point to distance themselves from forces like the UKD. The main directing body, the Uttarakhand Sangharsh Samiti, includes many individuals of democratic credentials from grass roots organisations and parties like the CPI-ML. The movement contains many reactionary elements as well and, as is the case with such events, can tilt in any direction. But there is a strong possibility of left-democratic-grass roots trends gaining the upper hand. After all, left

and democratic forces have always enjoyed a substantial presence in the area known for its liberal ethos.

Mulayam Singh's attempt seems to be to let the issue drag on and acquire the dimensions of a caste war in the plains which then could work to his advantage. With this in mind he, along with the BSP, has called for a pro-reservation bandh on September 13. Through such moves the chief minister is hoping to regain the ground he has lost in recent months. After the Rashid Masood episode in June-July the chief minister's popularity has suffered due to the continuing row with the BSP. The possibilities presented by defections from other parties have also been more or less exhausted. The latest in such defections was the crossing over of the CPI MLA, following which the CPI withdrew its support to the government. The party also published a lengthy letter accusing Mulayam Singh of violating democratic norms and going back on his political commitments.

The chief minister's credibility among left-socialist forces has suffered as a result of his policy of indiscriminate privatisation. Already 18 concerns in the power and sugar sectors have been handed over to private hands and more are to follow. These moves have evoked the hostility of pro-socialists forces like JD(G) which has threatened to launch an agitation against the privatisation of sugar mills. The distinct turn away from socialist populism to what can be described as a kind of regional version of the Congress has been accompanied by a steep rise in bus fares, the extension of trade tax to life-saving drugs and petroleum products, the final goodbye to all forms of land reform, the stifling of democratic norms and the extension of Section 144 to nearly all parts of the state on a more or less permanent basis. The only achievements which the government can boast of are repealing of the anti-copying act, implementation of the reservation policy and introduction of a trade tax in place of sales tax. All other poll promises, including opposition to GATT, supply of high quality seed and fertilisers at cheap rates, expansion of irrigation, land reforms, state assistance to poor patients suffering from serious ailments, proper balance between the prices of industrial and agricultural products, 2 per cent reservation to women in services, full development of Urdu and grant of equal status to Arabi-Persian madrasas on par with Sanskrit colleges have faded away.

It remains to be seen whether the chief minister's attempts to twist the present crisis will work. Even if it does, the results will be temporary. The restlessness in the plains is centred more on the general education-employment situation though the anti-reservationists are trying their best to divert it into other channels. The Mulayam Singh government is implementing the reservation policy with one hand while reducing the prospects of education by reducing the allocation for education, asking bodies of higher education to find their own funds and privatising educational institutions. All of this is creating a situation in which educational opportunities are not growing while the number of aspirants is going up. Subjects such as free education for dalits and women are disappearing from the agenda of the ruling parties while no initiative on the employment front has been forthcoming. Against this background, left-democratic organisations like the All-India Students Organisation (AISO) are planning to turn the focus of the current unrest in the plains to the demand for education and employment for all. The AISO has intervened in places like Allahabad and has been able partially to turn the student unrest towards basic issues affecting students, besides the issue of human rights abuse in Uttarakhand. AISO processions have been lathi-charged and many of its activists have been arrested. AISO is supporting the demand for a special reservation policy for Uttarakhand and has urged that the anti-reservation movement of the hills be differentiated from that of the plains. It has called a statewide convention on September 30, which will finalise plans for a 'gherao' of the chief minister in November on the issue of education and employment, including the grant of free education to dalits and girl students. Such efforts are being seen as part of the efforts to build an alternative left-democratic platform which can fill the slot of political opposition in the state. The Congress and the BJP are finding it hard to play this role even though they have not lacked opportunities.

MAHARASHTRA

A Way of Political Life?

A Special Correspondent

One can understand the response of the chief minister and his party to the mounting allegations of wrong-doing, but what is less easy to accept is the subdued reaction of opposition parties, the press, intellectuals and other opinion-makers in the state.

ONLY a few weeks back, the union finance minister showered public praise on Sharad Pawar, Maharashtra's much-accused chief minister. The finance minister asserted that continuance of Sharad Pawar at the helm in Maharashtra was essential for the success of the new economic policy—presumably, however grave the charges against him. The Pawar lobby must have been elated.

There is no doubt that Pawar can as easily get good character certificates from many others in his party, such as K Rai, Shankaranand and others. Many worthies in the opposition will be equally obliging. Pawar himself was part of the opposition till not so long ago and continues his excellent rapport with opposition politicians. (The much promised prosecution of Bal Thackeray of Shiv Sena is still to come about.) A BJP MP has already joined hands with Pawar in questioning the propriety of a retired official making official documents public.

Despite good words from many, serious charges continue to be levelled publicly against Sharad Pawar, mainly regarding his connections with criminal elements. Just when it looked as if the campaign started by G R Khairnar, deputy commissioner (since suspended) of Bombay municipal corporation, for a clean government, free of mafia control and aimed directly at Pawar was getting nowhere, graver charges have come in a court of law from a serving DIG of Maharashtra police. These include pressurising police officials to going easy on investigations against many individuals accused of serious offences—ranging from land-grabbing and smuggling to sheltering Punjab terrorists or even murderers.

Large-scale land-grab scandals have doggedly kept pace with Sharad Pawar ever since he transferred his loyalty to the Congress Party and soon came to power in Maharashtra in the late 80s. Earlier, it was the forcible urbanisation of the Vasai-Virar region near Bombay at the cost of tribals and other locals. While he was briefly the union defence minister, his ministry had proposed passing on vacant cantonment land to builders, a proposal suddenly withdrawn after he ceased to be defence minister. At present, it is the proposal for selling prime land in Bombay city belonging to textile mills to the builders at the cost of mill workers which is actively being promoted, not to mention other side-shows such as transferring forest land near Alibaug to builders for developing into a hill station, again at the cost of locals, or easing out the original allottees of a building society for accommodating one's own cronies.

In Bombay city and its suburbs, the truly astronomical prices of land and the super-abundance of black money together have made it quite easy for the underworld bosses to muscle their way into building activities. With a conniving administration, this passage can turn into a cake-walk. Many in Bombay fear that this has already come about, the

evidence of which is the several gruesome murders in broad daylight and on busy roads in the past couple of years. Officially, the police are still clueless about them. The sensational assassinations of a textile mill-owner about two months back and of the city BJP chief two weeks back are only the latest in the series.

Whether it was the case of carrying in his air force plane (as defence minister) persons who were later charged with involvement in the J J Hospital killings or of allowing the Congress MLA Thakur to escape to Nepal even as he was actually held at Calcutta airport; whether it was the case of phone calls to Dubai from Mantralaya or instructing police officials to go easy with investigating Thakur and Kalani (another Congress MLA), as attested by the DIG in an affidavit, or the charge of selective inactivity or communal partnership in the wake of the Bombay bomb blasts, it is clear by now that there are enough charges against the chief minister which need to be probed by an impartial agency with investigative powers. Indeed, several persons in the country, including in Maharashtra have been put behind bars under TADA or other acts on hearsay charges much less serious.

Of course, serious charges of misdemeanour are by now old hat in the Congress Party. Apart from stray statements by a couple of state leaders known for their anti-Pawar stance, the party as a whole has taken no official note of the open allegations of the criminal associations of one of its most senior leaders, let alone institute any inquiry either at party or government level. Given the general level of rectitude now prevalent in the party, this should cause no surprise to anyone.

What about Sharad Pawar himself? Today, one does not realistically expect him to step down till his name is cleared by an impartial inquiry. But what is noteworthy is that he has not chosen even to go to a court of law to try to stop the libellous attacks on him. Even Rajiv Gandhi had felt compelled to get a clean chit from a parliamentary committee in the Bofors matter. A sure sign of the changing times is that neither Pawar nor the government he heads finds it necessary to go through even such an exercise. Instead, an inquiry is started for breach of discipline against Khairnar.

Instead, supporters of Pawar have adopted the tactics used earlier by the enthusiastic supporters of Sanjay-Indira Gandhi. With a pliable official machinery, it has been no problem to them to prevent Khairnar meetings or to disrupt them. On many occasions, Khairnar has been prevented by the police officials from addressing a meeting or even from entering a city. The theme of the few rallies organised by Pawar supporters have been that the attacks on him are politically motivated, that an attack on him is an attack on rural Maharashtra, on non-advanced community leadership. Presumably, rural leadership or backward class leadership should not be measured by the law of the land. Evidently, the calculation seems to be that whatever the charges against a political leader, in the final analysis, a vast majority of the public will vote according to their casteist, communal and regional biases. After all, recent history does bear this out.

Interestingly, rallies in favour of Pawar are led mostly by persons like him, who have turned Congressmen only recently. Even more interestingly, a huge rally was organised in Bombay in Pawar's support by the newly installed leadership of the INTUC-promoted textile workers' union, itself accused of having been taken over by underworld dons to force workers to accept the sale of mill-owned prime real estate in Bombay.

One may understand the calculations of Pawar and his party. Less easy to understand is the very subdued reaction of the opposition parties, of newspapers, intellectuals or other opinion-makers in Maharashtra. Persons clamouring for 'proof' of Pawar's alleged misdeeds conveniently overlook the fact that enough evidence has emerged to justify a formal and honest inquiry precisely to collect evidence, if any, from official records and from persons under oath. There was much less evidence to start with in the Bofors pay-off case. But so far, no party or newspaper or MLA have asked for such an inquiry.

There seems to be a reluctance even to raise pertinent questions. Pawar has admitted that it was a mistake to have chosen Thakur and Kalani as party candidates. But he has not clarified as to who pushed their candidatures. If politics is to be rid of criminal elements, it is not enough to keep out Thakurs and Kalanis but also the party stalwarts who bring such specimens into the party. Is Pawar or his party (or any other party for that matter) ready for such steps? No one has raised questions such as these.

One must remember that 10 MLAs and municipal corporators in Bomby-Pune alone have been killed by rival underworld gangs in the last couple of years. Scores of municipal councillors or their near relatives have been found to be involved in sordid sex-and-blackmail rackets in different parts of Maharashtra. This is the kind of grass roots set-up that has come to dominate the political structure in Maharashtra. To control it, if not to cleanse it, a beginning has to be made as near the top as possible. To constitute a proper inquiry commission to investigate the issues raised by Khairnar and others would be the first correct step in this direction.

It may be that the opposition parties and personalities have been thoroughly disillusioned by the history of other recent inquiries. Or it may be that even opposition parties do not really wish for a thorough investigation in the murky wheelings and dealings of one of their own, whatever his party label. Or it may be that many of our leading opinion-makers are so sold on the charms of the present political establishment that they do not wish to rock the boat. After all, it was only a couple of years ago that 100 leading lights of Maharashtra's cultural and intellectual society were found willing to accept Rs 1 lakh each to celebrate Pawar's 50th birthday. Whatever the reasons, the brutal fact is that few eminent individuals or organised groups have come out to battle for a clean government in Maharashtra. No one is ready even to come out openly in support of a poorly paid, poorly-educated, inarticulate municipal official who has dared to rock the boat and has since been suspended.

There is not much chance that the opposition parties or their leaders will move very energetically in the matter of cleansing the government. For the moment, Pawar's position as chief minister seems unassailable. But there is yet another factor. One fine day, Pawar may be replaced as suddenly by his own partymen as his predecessor was over a year back. Palace revolutions, the standard method of changing governments in the 18th century, have again came into vogue in today's India. We may once again see the right conclusion arrived at by wrong methods.

A large section of Congressmen in Maharashtra have been eloquently silent in the whole Pawar imbroglio and the possibility of a palace *coup* is not as far-fetched as it may seem. But only one cheer will be called for if it comes about. Changing one person may stop his questionable activities, it does not reform the system. But in the present circumstances, that is the best that can be hoped for.

Politics of Population and Development

The Draft National Population Policy, while it continuously refers to the empowerment of women, is virtually silent on the growing feminisation of poverty in India, on the problems of women's status within the family, the domination and violence which characterise the working of the family and women's lack of access to independent incomes. Its reference to gender equity and to free and informed choice for women merely reflect its uncritical and deliberate assimilation of the vocabulary of women's groups.

THE debate on what has come to be characterised (unfortunately) as the 'population problem' in this country has now taken two distinct lines depending on the ideological proclivities of the debators. The Draft National Population Policy and its supporters have posed the problem of an unimpeded population growth in terms of its implications for growth with development and equity. The report assumes that uncontrolled population growth is the chief obstacle to development and that it comes in the way of ensuring a better standard of living and better health care for the people of this country. It assumes that the land-people ratio and the optimum carrying capacity of our planet ought to be discussed in the context of ever growing numbers of the poor.

The critics of the Draft National Population Policy, particularly most of the women's groups, reject the above understanding of our current situation. It seems to us that the attention given to population growth as a major cause of India's economic problem has ignored the extent to which India's development model adopted since independence is responsible for its severe economic crisis. This model can be characterised as growth with inequality and the decade of the 80s has been really high growth with high inequality. While the report lays great stress on north-south inequality, it is reluctant to address the problem of growing economic disparity within the country and the long-term ill effects of the new and evolving economic policy which is certainly not pro-poor, pro-environment or pro-women. It is also important to recognise that the "ever teeming millions" pose a problem not in terms of their numbers but because they constitute an expanding constituency of the poor, the malnourished, the diseased and the deprived. Unless the deprivations of these evergrowing millions are addressed in terms of a better quality of life for them, concerns about population growth will remain a malthusian horror. In this context it is worth reproducing the statement made by groups around the world at the PrepCom II (reproduced in *Legal Perspectives*, Document File No 31, 1994, Chengalpattu):

> The population issue cannot be considered in isolation, but should be related to the issue of resource use and wastage as a whole. The north, with 20 per cent of the world's population, uses up to 80 per cent of global resources and is responsible for 80 per cent of pollution that causes the Greenhouse Effect, ozone loss etc. The north with one billion people consumes 16 units of global resources (since northern per capita GNP is 16 times more than the south's). The south with 4 billion people consume only 4 units of global resources. Thus, the important equation is not so much that "4 out of every 5 people live in the South" but that "4 out of every 5 units of resources consumed are consumed in the north". Even if population growth went to zero in the south, only 20 per cent of the environment problem would be solved because the north (and the southern elite) would still be using up 80 per cent of the global resources.

India's development model has failed to create social and economic conditions that favour fertility decline. Skewed and unequal land distribution patterns uneven industrial growth, growing unemployment and under-employment, in short the structural inequality that underpins our economic system and the social inequality that marks our society are factors that have made for a high fertility rate. The report does not take cognisance of these factors and does not seem to think they are important in evolving holistic solutions to development and fertility control. It is tragic that the authors of the Draft National Policy should fail to explicitly integrate population into economic and development strategies; it is worse when they ridicule those calling for such integration by passing remarks such as the following: "There is often a widespread urge to "integrate" population policies with development policies, often with an implied presumption that the success of the former is inextricably linked with the success of the latter. In recent years the concept of integration has acquired a certain amount of halo or sanctity, similar to motherhood" (Pravin Visaria, 'Population Policy for India 1990s and Beyond', 7th K S Sanjivi Endowment Lecture, August 15, 1994).

While the report refers continually to a holistic and 'comprehensive' approach to health, this approach does not go beyond conventional maternal and child health care. While it adds to the list of health services for women it is [illegible] of a total health programme. The report's integrated approach is manifest only at the level of bureaucratic reconstitution and scant attention is given to expanding primary health care and to training a more professional, sensitive and accountable health work force. Further the current renewed emphasis on population control, given past experiences, suggests renewed external pressure, and recent happenings confirm this. "For instance, despite cuts in most areas of public expenditure, including health, the government's budget for family planning has increased from Rs 3,200 crore for the five-year period 1985-1990 to Rs 1,000 crore for the one-year period 1992-1993. The UNFPA has increased its assistance from US $ 52 million for 1985-90 to US $ 90 million for 1991-95. By 1995, the population growth rate is to be reduced from 2.1 per cent to 1.76 per cent, and the crude birth rates from 30.5 to 26.7 per 1,000 population. The use of contraceptives is to be increased from 43.3 per cent to 53 per cent. US AID has given financial assistance of US$ 325 million for decreasing the total fertility rate in Uttar Pradesh, the state with the largest population and highest fertility and mortality levels, from 5.4 to less than 4, and increasing couple protection rates from about 35 per cent to 50 per cent by the year 2000. This is the largest programme of foreign assistance for reducing population growth rates that the country has ever embarked upon" (T K Sundarai, 'Women and the Politics of Population and Development in India', *Legal Perspectives*, Document File No 36, 1994).

The report refers continuously to the empowerment of women. How is this empowerment to be brought about? Much noise has been made about the doing away with targets. While the abominable practice of setting targets for the administration of particular fertility control measures certainly needs to be done away with, there is need to lay down quantitative goals particularly in three areas that are mutually supporting and of critical importance to the achievement of other important population and development objectives. These areas are: education, especially for girls; infant, child and maternal mortality reduction; and the provision of universal access to family planning and reproductive health services. The authors of the Draft could have displayed their political commitment to the empowerment of women by, for example, accepting the goals set by the World Summit for children, held in 1990, namely, a reduction in infant and under-5 child mortality rates by one-third, or to 50 and 70 per 1,000 live births, respectively, whichever is less. We do not need to labour the point that "child survival is closely linked to the timing, spacing and number of births and the reproductive health of mothers. Early, late,

numerous and closely spaced pregnancies are major contributors to high infant and child mortality and morbidity rates, especially where health-care facilities are scarce. Where infant mortality remains high, couples often have more children than they otherwise would to ensure that a desired number survive."[1]

The report is virtually silent on the growing feminisation of poverty in India. Its reference to gender equity and to free and informed choice for women merely reflect the report's uncritical and deliberate assimilation of the vocabulary of women's groups and women activists. Apart from stating that the new policy will work to check the shifting of the burden of family planning on to women and aim to foster a "culture of joint responsibility of the couple", the report no where alludes to the problem of women's status as such in the family, the dynamics of control, domination and violence against women which characterise the working of the family and the lack of access to an independent income, that most women suffer. The report is also silent on the use of coercion and consent, of economic power, and cultural authority within the family to secure and perpetuate the subordination of women. It is clear that unless a working model of the various types of families and their dynamics is posited, notions of 'joint responsibility' cannot simply be realised in practice, nor can policies and programmes be sufficiently sensitive to the needs and rights of women and children.

The report envisages a major role for panchayati raj institutions in the implementation of the proposed population control programme but its conception of these institutions and their viability is severely limited. Panchayati Acts, as amended in the various states, have been examined, analysed and criticised by political observers, scientists and other concerned citizens. Questions have been raised about the financial viability and the administrative and political powers of even amended panchayats, and, studies have been carried out on existing panchayati raj institutions in particular states. But the report has not taken into account these debates and seems to be unduly euphoric about the possibilities of panchayati raj institutions. Neither has the report taken into consideration factors such as caste and economic status that are bound to influence the composition of panchayats. The report is also not clear as to the exact linkages that ought to obtain between panchayati and nagarpalika institutions, state governments and the proposed new commission.

The report is equally silent on the impact of the new economic policy—with its centralising tendencies, particularly in terms of transfer of resources to the states—on the proposed process of decentralisation. It is clear that unless the possibilities of a decentralised mode of working are considered in the context of the changes wrought by the new economic policy, decentralisation will remain merely a formal (and fashionable) proposition than a substantive one. The report contradicts its own attempts to privilege panchayati raj by announcing that ultimate responsibility for implementing policy and making decisions will rest with a centrally constituted committee, namely, the Population and Social Development Committee (PSDC). Not only has the report not drawn out any broad, concrete guidelines as to the functioning of the PSDC with respect to the various decentralised levels of the polity but it has also not recommended any means/methods through which the PSDC may realistically assess local needs and resources. Neither has the report specified as to how panchayat level representatives will be heard, heeded and made part of the decision-making team at different levels of government.

Certain details contained in the report are truly shocking: (a) The report envisages measures such as consideration of age of marriage, adoption of small family norm, to be enforced in matters of recruitment to and promotion in government jobs. Besides, following the example of panchayat acts as amended in Haryana and Rajasthan it proposes to debar persons with more than two children from contesting elections to panchayats. These seem to be punitive measures that no democratic-minded person can approve of. Besides, the example of these two states is unfortunate since lowered fertility rates there co-exist with adverse sex-ratio. It is also extremely unfortunate that, its democratic intentions notwithstanding, the report should thus imply that women of child-bearing age—often the younger and more eloquent and politically alert of the village female population—should be disallowed from contesting elections. This not only discriminates against women but more realistically will put younger women in a double bind: if they have mothered only daughters, the family pressure to produce a son will work on them; at the same time the proposed disincentive through debarment will exert its own pressure. In such a context they may not be in a position to make use of the 30 per cent reservation allowed under the new panchayat dispensation.

It is difficult to understand how the report with its ostensibly pro-people image could endorse the freezing of the number of seats in the parliament and legislatures. Not only is this patently undemocratic but it grants a lie to the report's insistence on 'participatory' politics. The use of the term 'political commitment' to describe the motivating factor behind the apparent success of the above mentioned and clearly primitive measures in Haryana and Rajasthan is ironic. The representatives of the Indian state need no special commitment to discipline and punish since these constitute tacit but unacknowledged premises of their working ethos. If the authors of the report had stressed on the importance of displaying political (and not merely administrative) will in matters such as ensuring that every child goes to school, that no child or adult labours in inhuman conditions, that women are not unfairly and routinely discriminated against, their intentions would have been laudable.

(b) The suggestion that military and paramilitary forces be used in promoting population control options is truly deplorable. In another context, Ashish Bose (a member of the present drafting committee) while lauding Tamil Nadu's 'successful' demographic transition, referred incidentally to the Indonesian experience and concluded thus: "The main reason for the success of Indonesia model is the excellent military-style logistics in running the programme. In India we have an overdose of democracy" ('TN's Successful Demographic Transition', *Financial Express*, January 4, 1994). What Bose did not reveal was how the military abused human rights in implementing family planning programmes in Indonesia. To quote Zeidenstein, who headed the Population Council for a number of years and who in an essay describes the Indonesian family planning programme thus: "Norplant has been administered in part by means of 'safaris'—operations in which family planning personnel, accompanied by soldiers, enter a village, gather the populace together, and expound upon the advantages of family planning often with an implied threat that the village will be punished if family planning methods are not adopted. These safaris have historically played an important part in Indonesia's family planning programme, typically resulting in village women's mass acceptance of contraception—often of the one method being promoted at that particular moment by the government" (quoted by T N Krishnan, 'Population Policies: Some Issues', book review in *Economic and Political Weekly*, August 6, 1994, p 2076). While we are all for efficient and accountable procedures being evolved and implemented, we urge Ashish Bose and Co, to concretely explicate how abuse of human rights such as the above will be dealt with and prevented in India.

(C) We are pained at the utter insensitivity with regard to women's health as evident in the report's comment on contraceptive use. Given the adverse side-effects and long-term effects on a woman's body of existing contraceptives and, given the gender-blindedness of the scientific community, it is shocking the report should casually comment that no contraceptive is without risk. Even a quick documentation of the

existing material on the functioning of institutes such as the Indian Council of Medical Research and the Family Planning Association of India will bring out the callous and contemptuous manner in which these bodies deal with humans, particularly, women. For example, "Although an Indian vaccine, developed by G P Talwar with support from the Population Council, the Canadian IDRC and the Indian government, has been tested on only 180 women, it is being billed by the Family Planning Association of India as "safe, devoid of any side effects and completely reversible". Even the scientific community knows that such assertions are patently false—for instance, many questions still remain about the vaccine's long-term impact on the immune system and menstrual cycle. There is also documentary footage of women being denied information about the vaccine in clinical trials. Nevertheless, the Indian vaccine is being prepared for large-scale use" (quoted in *Medico Friend Circle Bulletin*, May-October, 1993, p 10).

The problem instead is being posed as one of informed choice. However such a choice ought to be made in a context where mechanisms exist to ensure that women (and men) in search of contraceptives do not end up choosing drugs and implants that are positively harmful. Given the fact that women's groups have consistently campaigned against the use of injectable contraceptives that are likely to cause unknown immunological disorders, surely the report should have recommended that the state take a clear stand on banning the production and marketing of these contraceptives? A policy that attempts to give individuals the right to choose contraceptives and plan their family without providing an enabling environment that would render the choice to be automatically 'safe' and 'risk-free' cannot, for obvious reasons, go very far.

In the face-to-face discussion that representatives of women's groups had with M S Swaminathan and T V Anthony (the latter is also the former chief secretary to the government of Tamil Nadu), it became clear that such criticisms and misgivings as those listed above would not be heard at length. Swaminathan, for instance, in his response to these, skirted the issues and insisted on referring to the draft policy report to clarify matters. He refused to grant that the report had not sought to consider population policy in the context of our extant model of development. Arguing that the report could not be expected to furnish an economic essay on development he rejected the criticism that it lacked a cogent perspective on the economy, on questions of land and labour. Likewise, he refused to accept the fact that the report had avoided talking about the new economic policy and its impact on population problems. He was merely content to reaffirm the faded rhetoric as regards the logic of north-south economic relationship that already exists in the report. Arguing that one has to take the prime minister's word in good faith (*sic*) when in his independence day speech the prime minister explained his decision to disinvest in profit-making public sector enterprises to enable a passage of funds gained from cuts in subsidy into social welfare activities, Swaminathan dismissed the criticism as to the lowering of state spending on social issues, lightly.

His responses on other points of criticism were, to say the least, routine and displayed an unwillingness to accept seriously differing and alternate points of view. At one point, though, he was forced to admit that there could be different points of view and he referred to (mysterious) internal discussion papers that recorded the commission's debates. However, one is forced to doubt the existence of these papers, since this was the first time they had been referred to by the authors of the draft; besides, precious little evidence of that ostensibly nuanced inner debate was reflected in the policy statement itself.

This brings us to the entirely different problem of the way such commissions function. It seems unfair to release the policy for discussion and then when criticisms are made, revert to unspecified arguments that are recorded in reports one is yet to see. Also to maintain as Swaminathan and Anthony did, that criticisms have to be forwarded to the health ministry since the commission is officially disbanded, not only betrays a poor sense of responsibility and accountability but also a certain unmistakable arrogance and disrespect for criticism and debate. It would be pertinent to record in this context the different strategies adopted by such commissions to confuse and confound various sections of the population. One strategy consists in involving affected groups at various levels ostensibly to open up a dialogue. However, as women's groups particularly have realised, the main purpose of such dialogue sessions is basically to "divine (women's) arguments, appropriate their language and finally exhaust them". Another strategy is to challenge, in this case the women's groups, to produce an alternative document. Our poser to this criticism (the latter) is very simple: without a similar mandate, without similar facilities enjoyed by the Swaminathan committee by virtue of this official mandate, the women's groups are not prepared to fall into this neatly laid out trap in the form of a counter criticism. Further and more important it is not as though alternative proposals do not exist. If only the commission had looked around it would have spotted any number of well-argued out, informed documents both national and international, which have discussed the issue of population in a holistic, more humane framework.

Lastly it has become habitual for commissions to claim that they are concerned above all with policy and operationalisation is not one of their concerns. The question that needs to be raised here is this: of what use is a policy document whose operational principles are not inherent to its arguments? Especially since policies such as this concern people's (particularly women's) lives, bodies and their very right to life.

Note

[A substantive part of this note by V Geeta and Padmini Swaminathan is based on presentations made at two meetings (August 6, 1994 and August 29, 1994) held at Madras to discuss the Draft National Population Policy. While acknowledging in particular the contributions made by the principal discussants, namely, K Nagaraj, Manabi Majumdar, V R Muraleedharan and Mythili Shivaram, the authors would like to thank all the participants at both the meetings. Responsibility for the above interpretation of the discussions however rests solely with the authors.]

1 For comprehensive details see the *Draft Programme of Action of the International Conference on Population and Development*, Note approved by the Preparatory Committee for the International Conference on Population and Development, 13th May 1994 (mimeo).

Draft Forest Legislation

Missing the Wood as Well as the Trees

Ashwini Chhatre

The draft forest bill circulated in 1982 was industry-oriented and the present bill is ostensibly conservation-oriented. It is time to press for a law that respects the legitimate needs of people living in and around forests for their subsistence requirements, while at the same time addressing the task of environmental regeneration.

WHILE much attention has been paid to the issue of forest use and the problems faced by the forest dwelling communities in recent years, the issue has been formulated in political-economic terms only lately. Analysis of forest legislation has hogged most of this attention. In this context, a debate has started on the new draft forest bill right now, being circulated to the states ('Proposed Forest Act: An Assessment', Sharad Kulkarni, *EPW*, July 1994). This article is an attempt to look at the proposed bill and then go beyond it to argue for a concerted campaign for a new forest legislation. It is also an attempt to respond to some points made in Sharad Kulkarni's article.

A brief glance at developments in the forestry sector in the last 23 years provides a confusing array of options exercised or proposed by the state or other interest groups. Wildlife conservation, biodiversity, people's participation and giving over lands to industry have figured prominently in this. It is important to look at the proposed bill in the context of these issues. Besides, the structure of the bill and its wording are themselves quite illustrative of its intent.

Old Wine in New Bottles

The proposed bill retains all but one of the 86 sections of the Indian Forest Act 1927, which it proposes to replace, and adds about 70 more. Surprisingly, Kulkarni has chosen to welcome the bill in its present form and only recommended a few changes. If one agrees that the IFA '27 is anti-people, how can addition of 70 more sections make it people-friendly? In his article, Kulkarni has missed some major implications of the bill that will have far-reaching implications for the lives of millions of people dependent on forests.

The most controversial insertion in the bill is the concept of *carrying capacity* as it will be applied to reserved and protected forests, which Kulkarni has chosen to ignore. The forest settlement officer is expected to accept or reject any claim to rights over forest produce only after taking into consideration the 'carrying capacity' of the respective forest, in consultation with the presenting officer who will be a forest department official (section 12). Moreover, if the carrying capacity of the said forest is being exceeded, the state government can stop the exercise of any or all rights in that forest at any time (section 22A). *Nowhere in the bill has the concept been defined or explained.* It has been left completely to the discretion of the FSO. Obviously, the bill proposes to deny rights to people under the garb of conservation.

The second major omission in Kulkarni's article pertains to the increasing centralisation of decision-making power at the centre that the bill proposes. The last two decades have witnessed an acrimonious struggle between the centre and the states for control over forest resources. The 42nd amendment which shifted forests from the State to the Concurrent List, the 1980 Forest Conservation Act and its amendment in 1988 are a testimony to that. *The proposed bill takes the process even further by granting the central government almost decisive powers in matters relating to forests.* As mentioned by Kulkarni, the centre can direct the state governments to constitute either reserved or protected forests wherever it deems it necessary (sections 3 (2), 29 (2)). The centre has also taken over the power of the state government to levy a duty on timber and other forest produce and also to monopolise or nationalise the same (sections 39, 40A).

Most importantly the centre will take over the power to make rules on almost every aspect of forest management (section 76a). "*Where rules framed by the central government and the state government are in conflict, the former shall prevail*" (section 76 (3)). This in turn means that in situations of local conflict, the state government can plead helplessness before the central rules, and the bargaining power of local communities *vis-a-vis* the state government will be adversely affected. While it is true that state governments are not driven by the considerations of the people in general, greater centralisation will mean that local organisations or localised movements will no longer be able to pressurise the state governments to make rules according to local needs and circumstances.

Such pressure has been crucial for many community forestry and participatory forest management programmes. The bill even goes back on all these recent attempts by the state governments to change policies according to local circumstances and to accommodate the growing pressure to involve people in the protection and management of forests. It was first included in the national forest policy resolution in 1988 and was followed by the central and state government resolutions on Joint Forest Management (JFM). The bill not only does not mention any such thing, but also further reduces the space available to state governments in implementing the JFM resolutions. Strangely, Kulkarni seems to be of the opinion that defining 'usufructs' in the first chapter of the bill is all that is required to acknowledge JFM in the new bill. The closest that the bill gets to the concept of JFM is in the chapter on the Village Forests where it lists the functions of the 'local body' (defined as "panchayat or any other local body representing the village") to whom the management of the village forests will be entrusted.

The JFM experiment has been very successful in West Bengal in regenerating degraded forests. Over the last six years it has spread to many other states. The ministry of environment and forests (MOEF) and 15 state governments have promulgated resolutions encouraging the involvement of local populations in a manner similar to West Bengal, to protect and manage forests. The proposed bill has provisions that will act as disincentives to constituting village forests as a modified form of JFM. Some of these have been mentioned by Kulkarni. But again he has missed what to this author are the most obvious implications.

Most of the forest land in India is constituted as reserved forests. The bill does not allow reserved forests to be converted to village forests. This provision rules out JFM as a viable alternative for a majority of forest areas in India. Whatever little fraction is under village forests presently, is heavily encroached upon by all kinds of interests and they will resist any attempt at eviction. Finally, the provision that makes a farce of the chapter on village forests (chapter 3) is surreptitiously introduced in Power to Make Rules (chapter 12). Under this, the state government has the power to make rules for the "protection, development, management and regulation of access of individuals and communities to a village forest and distribution of usufructs and fuelwood from such forests" and "may prescribe the manner in which the management plans for such forests shall be prepared and executed", how the village forest development fund shall be utilised and loans advanced shall be recovered, and also "how duties and responsibilities of individuals and (local) body shall be discharged" (section 76(2)e). After making a pretense of giving over forests to village

bodies, the bill gives the state government sweeping powers to make rules regarding them.

Kulkarni has chosen to cursorily dismiss the sections relating to shifting cultivation. However, it is still the major source of livelihood of a large number of people in the north-eastern states and the provisions of the bill on shifting cultivation seem to be designed solely for application in the north-east. A detailed procedure has been worked out with a view to eradicate shifting cultivation completely. This epidemiological approach to the phenomenon is neither new nor recent. Dislike for the practice of shifting cultivation dates back to the British period. The colonial administration came down heavily on it and many communities were forcibly settled. This dislike has continued into post-British India and even more undemocratic methods have been used to restrict it. In the north-eastern states, where state terrorism has already wrought havoc with the lives of the inhabitants, a crackdown on shifting cultivation might just be the last straw.

Everything that is wrong with the bill cannot be outlined here. But to summarise, a few things require mentioning. The classification of forests in the bill is still on the same old lines—in terms of degree of control. Reserved and protected classes of forests do not denote either the quality or the envisaged use of that forest. Secondly, the bill does not recognise the growing population that has claims on the forests for their daily needs. The system of record of rights in reserved or protected forests is frozen at the time of the settlement. Any such settlement of rights two or more decades ago must be reviewed periodically. The bill ignores the issue entirely. Finally, there is the so-called problem of 'encroachment' on forest land and its encouragement by 'politicians'. Many of these 'encroachers' have been cultivating these lands for a long time now. This phenomenon has been summarily dismissed in the bill by preventing diversion of forest land for "regularisation of unauthorised occupation". In all these respects the bill is an amazing document, in that it refuses to acknowledge the phenomenal changes in the ground reality.

Need for a New Law

The last 25 years have seen a spate of legislative measures concerning the environment in general and forests in particular. As mentioned earlier, some of these were a result of the tussle between the centre and the states for control over forest resources. In addition, the growing global pressure and an increasingly environmentally sensitive middle class has also forced the state to look more and more eco-friendly, at least in letter if not in spirit. There has been a consistent pressure also from the [illegible] millions who are most adversely affected by environmental degradation. Unfortunately, they have had the least say in policy or law-making. This major interest group in the forestry drama has mostly been kept busy with livelihood struggles and whenever it has spoken, it has been in response to some undemocratic move of the state.

The case for a new forest law is impeccable. The present law is totally antiquated and out of context. It was enacted in its present form in 1878, with major additions and some changes in 1927. Since then the act has remained more or less the same. It was originally designed to accelerate the 'scientific' exploitation of forests in India, which it did with a remarkable degree of efficiency. In fact it was so good that it was used as a model for similar laws in other British colonies. In post-colonial India, the powers that be found it convenient to continue with the same law as the end-use of forests did not change much in character and increased greatly in intensity, although it was now justified in nationalist terms. Surprisingly, the performance of the forest department was never the object of any debates or close scrutiny till the early 70s. Focus on forest legislation came with the widespread agitation against the proposed forest bill in 1982. The anti-people character of forest laws was exposed and discussed perhaps for the first time at the national level. Now it is recognised that a new law [illegible] regarding forests.

The 1982 bill was industry-oriented and the present bill is conservation-oriented. It is time to press for a law that respects the legitimate requirements of people living in and around forests for their subsistence needs, while at the same time addressing the task of environmental regeneration. This seemingly impossible task has been tried successfully in parts of West Bengal under the name of Joint Forest Management. JFM has subsequently been accepted and adopted by the central and state governments, although they have gone about the job of adpating JFM to the peculiar circumstances in respective states in a most unimaginative manner. The space for JFM has been created by the continued struggle of the people against the forest laws. It is, however, only a small step towards establishing people's control over natural resources that critically affect their lives.

The proposed bill should be used as an opportunity to generate a wide-ranging debate on various aspects of forest-use and its representation in a law and pressurise the central government to draft a new bill in consultation with people's organisations. A process already seems to have started to this end. The final form and content of this law might have many undesirable elements, but there will definitely be some aspects that have been absent from forest laws till now.

Unfilled Posts Spark Dalit Protest

M Shatrugna

The absence of a rational recruitment policy, and a lack of commitment on the part of the university administration in filling the reserved quota of teaching and non-teaching posts has led to disgruntlement among dalit employees.

THE 75-year-old Osmania University, the oldest in the state is beset with problems: administrative ineptitude, a teaching community not socially sensitive and the growing lumpenisation of the student community. The chinks in the university administrative set-up came out into the open recently when a section of the teaching and non-teaching community belonging to the weaker sections formed a joint action committee (JAC) and presented a charter of demands, seeking the filling-up of reserved category posts in various teaching and non-teaching departments and reinstatement of the registrar Hanumanulu Polasa, a BC, sacked on grounds of 'inefficiency'. When the rally organised by the JAC wanted to present the memorandum of demands to the board of management of the university on June 24, the rallyists were bashed up by the police, a number of them arrested and show-cause notices issued to the 'erring' rallyists. Inept handling of the situation coupled with administrative arrogance egged on by an obliging local police has come in for sharp criticism not only by the teaching community but also citizens of Hyderabad.

Like in many other departments, quota posts are not totally filled in the university since 1982. The successive vic-chancellors and obliging boards of management have failed to evolve a rational, scientific recruitment policy for teachers. Despite several government directives, the university administration has failed to fill the quota posts. Last month the JAC drew up a set of demands seeking the relaxation of eligibility conditions for entry into the lecturer's category and of promotional conditions at the readers' level. But as per the UGC guidelines, those seeking lecturer's grade should pass the eligibility test (the national eligibility test (NET)) conducted by the UGC or a body accredited to the UGC like the Andhra Pradesh College Service Commission. The JAC wanted relaxation of the NET qualification for the OBCs and SCs as relaxation was already granted to the scheduled tribes. It should be recalled that the NET was conceived during the implementation of 1986 UGC pay scales as a method to 'systematise the academic standards' in the universities. There is nothing wrong with such a scheme. But the NET has turned out to be a nightmare not only for a number of candidates in general but also several bright scholars holding Ph D degrees. A balanced stand ought to have been for a redesigning of the NET system instead of abolishing or ignoring it altogether. As expected, the JAC plea was not found favourable even among those teachers who have been championing reservations for weaker sections.

A section of the teaching community has launched disinformation campaigns about the local NET examination suggesting that the test is conducted only in English, which is contrary to facts. Enquiries reveal that Telugu is also offered as an alternate medium for the local NET examination. While it is true that the percentage of pass at the NET in some subjects is less than 10 per cent, the teaching community instead of improving their own standards of teaching and the examination system has blamed NET for the poor performance of the candidates at the test.

Further the teaching community has not been able to explain the low pass percentage at the intermediate and undergraduate degree level and unusually high percentage (sometimes 100 per cent) of students who pass the postgraduate examinations. Interestingly almost 90 per cent of those getting through the postgraduate examinations have been securing first classes which can only be because the university admits either the 'most intelligent' or due to 'non-academic' factors contributing to the 'high performance'. Well-respected and senior teachers admit in private that the PG exam is only a formality for various non-academic reasons and they are forced to pass all the candidates with the majority getting first classes. NET unintentionally questions such fraudulent degrees. Needless to say, NET can also be improved and bettered. The second demand of the JAC, that the qualification for a reader's post should be pegged down to a Ph D degree with five years' experience instead of eight years' teaching was agreed to by the university after a protracted struggle. As a wag put it, if a Ph D degree-holder with five years' teaching experience cannot reach the minimum standards required, he or she is not likely to improve even after eight years of experience.

An unexpected outcome of the university decision has been that the competition for the limited/advertised posts has increased not to the linking of the 'eight-year' category of teachers. The present recruitment policy has also raised a number of other issues. For instance, the list of eligible candidates for the recently held interviews has quite a few 'non-locals'. Interestingly, even the five-point formula evolved two decades ago in Andhra Pradesh to protect the interests of the local candidates is limited in its scope only to student admissions in the educational institutions. It does not cover job recruitment in the universities. But a section of the teachers took it upon themselves to misinterpret the five-point formula to serve their vested interests. Also this problem is not limited to Osmania. An apex body like the State Council for Higher Education should have taken the lead in calling a meeting of the vice-chancellors to thrash out the issue by arriving at a uniform policy of teacher recruitment in all the state universities. But one cannot expect such an initiative from the Council now as has remained 'headless' for the last two months. Meanwhile the so-called locals have had a field day in demanding that 'non-locals' should not be considered for recruitment. By overstressing the issue of 'locals' vs 'non-locals', the champions of localism are riding a tiger at the moment.

Thirdly, in support of its stand the JAC had put out a pamphlet listing the positions occupied by the 'upper castes' in various administrative jobs. To begin with, most of the administrative posts are useless and wasteful. They can be dispensed with especially when there is a tremendous resource crunch in the university. The teaching community instead of asking for streamlining the administrative system, wants the 'rule of reservation' to be followed in such wasteful posts as well.

To meet some of the allegations made by the JAC, the university in a welcome move has come out with a detailed list of the backlog posts in all categories, rules of recruitment at the lecturer's stage and ground rules for promotion at the reader's level following the UGC stipulations. According to the list (published in *Indian Express*, July 15), for the 203 posts advertised (65 for SC, 66 for ST, 25 for BC and 46 for OC), there are adequate number of qualified candidates satisfying the UGC guidelines. For instance for 12 posts of lecturers in the BC category, there are 464 eligible candidates. For the 22 SC lecturers' quota, there are 143 qualified candidates. But for the 32 ST quota, there are only nine candidates. As per the UGC guidelines and the AP government's stipulations of 1991, relaxation of qualifications are to be made only in case of non-availability of qualified candidates. As such the university was quite within its jurisdiction to relax the qualifications for ST candidates.

But the whole issue has become twisted by asking for 'relaxation' for other categories also. Needless to say, the demand is quite unjustified.

The JAC further wanted the arrest and prosecution of the killers of Arun Kumar, an ST student who was done to death by a group owing allegiance to the ABVP two months ago. Though it is a genuine demand, the JAC itself has done precious little to register its protest effectively barring a routine paper protest. To press for the acceptance of its other demands, the JAC pitched a tent near the state secretariat on July 11, and went on an indefinite hunger strike much to the surprise of many teachers and sympathisers who were not prepared for such a sudden development. Interestingly the hunger strike coincided with the commencement of the state assembly session. After three days the police pulled down the hunger strike camp and shifted the strikers to the hospital. Questions about the strike were raised in the assembly by the opposition the following day. On the last day of the assembly on July 15, Nara Chandrababu Naidu and leaders of the CPI and CPI(M) visited the hospital and offered fruit juice to the four strikers, formally calling off the hunger strike.

To conclude, though the university of late has shown some courage in tackling the 'NET' issue effectively, it should show more guts in cleansing the university of administrative cobwebs, publish a White Paper on the quota posts and a policy paper on teacher recruitment and promotions to refurbish its tainted image among the dalit sections.

Beurs and Beurettes of France

Crisis of Identity

Lata Murugkar

The emergence of 'beurs' and 'beurettes' on the French public scene since the early 80s has raised issues of integration and religious and cultural identity of these French-born, north African, second generation children, confined to the bottom strata of the French society.

TODAY in France immigration and integration are two of the most frequently discussed issues in the political, social, cultural and economic spheres. When the French speak of immigration, they refer almost exclusively to the 1.5 million Muslem immigrants from three north African countries who have settled in France in the last generation. The immigrants from these three countries, Algeria, Morocco and Tunisia, are called Maghrebins. In 1989 there were approximately four million residents, of which 43 per cent were of north African ancestry. Among these Algerians count the highest, i e, 8,20,000; Moroccans are 5,17,000, and Tunisians 2,03,000, to which one might add all the Franco-Algerian youths who have French citizenship.[1] Of the four million resident foreigners, one-third are under-twenty year old. The highest youth proportions are to be found among the north Africans: 43 per cent of the Moroccans, 40 per cent of the Tunisians and 41 per cent of the Algerians are under twenty. The Maghrebin population is characterised by an increasing number of women and young people.[2] It is mainly the young Algerians who have been called 'les beurs' and young females 'les beurettes' since the early 1980.[3] They are also called 'young immigrants' or 'second generation immigrants', although most of them are born in France and are not in a literal sense immigrants at all. The emergence of the 'beurs' as a new reality on the French public scene since the early 80s raises a number of questions: Could these French born north African children be integrated when they are confined to the bottom strata? Would they turn to Muslim religion to rebuild an identity? Could they maintain their separate cultural identity?

Immigrants from Algeria

From the very earliest stages, at the beginning of the 20th century, Algerians left the poorest parts of Algeria—most notably Kabylia, a mountainous region to the east of Algeria—to work for a few years in France as labourers in agriculture and industry under the rotation system. All immigrant workers were expected to return home in due course. In the last 15 years the perception of immigrants as temporary workers has changed; they are now regarded as permanent residents. Since the late 1970s France has been stuck with high unemployment, a problem that has consistently worsened over the past 10 years. The increased population of north Africans was considered as the chief reason of unemployment. The bitter experience of Algerian war also strained the relations between the French and north Africans. Since racially motivated attacks by French people on migrants (especially north Africans) were on the increase, the Algerian government eventually called a halt to further immigration in 1973.[4] France also decided to halt all further immigration from third world countries in 1974.

The French institutional system weighs more heavily on immigrants from north Africa, and of all the national groups it is the Algerians who bear the brunt of this system and indeed of French animosity towards immigrants.[5] The main reason is the continuing reverberations of the Algerian war. The scars of the period remain in the memories of both sides.

The general rise in unemployment seen in France was of course a consequence of the world economic recession, which gathered speed after the first oil crisis of 1973. Most of the north African immigrants were illiterate when they emigrated and many remained so in France. Their concentration in the least skilled areas of production is partly a reflection of their low levels of education. Algerians have suffered from discrimination in the labour market because of their nationality. Unemployment was far higher among north Africans between the 1975 and 1982 censuses and highest of all among Algerians.[6] With the highest rates of unemployment, the lowest paid jobs and bigger than average families, living standards per head have been generally much lower among members of the north African community than among the French, a fact which is clearly reflected in their poor housing conditions. Crime is particularly prevalent among the most materially disadvantaged in society and a much higher proportion of immigrants, particularly north Africans, falls into this category. 'Beurs' came increasingly to the attention of the public partly as a consequence of the publicity given to high crime rates among north Africans.

Algeria was officially regarded as an integral part of French territory during colonial period. As all Algerians are considered to have been French until Algeria's independence in 1962, children born to them in France since then are automatically deemed to be French from birth.[7] Algeria refuses recognise these claims, so they are regarded as citizens of both France and Algeria. The certificating claims of the French and Algerian governments parallel the divided emotions and loyalties which the beurs themselves often experience.

Secular vs Islamic

From their earliest years the children (second generation) of immigrants learn their mother tongue Arabic or Kabyle along with the Islamic beliefs and customs of their parents. But at school French is the sole language of instruction and religious practices are excluded by law. As the children spend

more and more of their time outside the family home, French gradually takes over as their principal language (in many cases they forget almost all the Arabic or Kabyle that they once knew) and, at the same time, secular values challenge and often displace Islamic beliefs. Despite Algeria's efforts to compensate for some of these deficiencies by a number of educational initiatives aimed at the children of emigrants, there is ample evidence to show that Islam has a much weaker hold on second generation members of the immigrant community.[8] Most beurs seem attached to Islam by little more than sentimental bonds derived from feelings of loyalty to their parents. However, French perceptions of racial difference and national identity of the beurs are based on images of the Arab world and the world of Islam. There is a fear that the beurs share a supra-national Islamic identity. However, most of the second generation educated population is secular. It has sometimes been suggested that the racist attitudes to which the beurs are often subjected in France may stimulate among them a more militant attachment to Islam, possibly with political overtones.

Pressure Groups

Those born since 1963 began to come of age during the 1980s. The 1981 socialist victory was an opening for substantial improvements for the rights of immigrants in French society. In Autumn 1983, a march initiated by young descendants of north African immigrants from the neighbourhood of 'les Minguettes' in the suburbs of Lyon was led to president Mitterrand's office in Paris. Organised under the banner 'pour l'egalite et contre le racisme' (for equality and against racism), the march was the starting point of the 'beur movement'. The objective of this demonstration was mainly to sensitise the public to the beurs' critical social position (their socio-economic marginalisation). Some of the founders of this movement joined SOS Racisme, a powerful youth association formed to combat racism, supported by left wing political parties (essentially the socialist party) and led by Harlem Desir, a member of the French Caribbean community.

SOS Racisme rapidly became France's best known pressure group on immigration after its creation in 1984. Within six months it sold half a million badges bearing the catch-phrase 'touche pas a mon pote' (hands off my friend). SOS Racisme prospered on a mixture of televised pop concerts and the left government's subsidies. It began to insist on the right to be different, to have a non-French cultural identity, while at the same time claiming political rights within France. In the heyday of SOS Racisme some people seriously proposed that France should become a multicultural society, complete with bilingual education and all that it would imply.[9]

The shift from the single male worker before 1974 to family immigration after that date produced greater number of imigrants not available for work[10] (the youths and women at home). Their visibility in French cities—mainly within and around the cities of Paris, Lyon and Marceille—during the 1970s contributed to the sense of a threat to Frenchness and the subsequent move towards a more xenophobic and racist perspective. The failure of the left to resolve the economic and political crisis that it inherited from the preceding decade, the presence of immigrants in general and Maghrebins and Algerians in particular, high criminality, general traumas of urban life and rising unemployment, intensified the racist attacks and rightward move of right parties and the extreme right wing Front National, a neo-fascist political party in 1980s. Since the early 1980s immigration has been held high on the political agenda in France by the electoral success of Jean-Marie Le Pen's Front National, which advocates racist solutions.

SOS Racisme is today the principal enemy of the Front National because it symbolises the fight for a French multicultural society and separate ethnic identity, i e, integration without sacrificing one's own identity.

The 80s have also witnessed a struggle by second generation immigrants to find a voice and space within French society. The October 1981 lifting of all restrictions on freedom of association for foreigners permitted the creation of numerous associations among immigrants and their children and thereby increasing the awareness of militant and collective action as a means to achieve equal rights and opportunities. the newspaper *Sans Frontieres*, the radio station Radio-Beurs, the rock group Carte de S'ejour and the magazine *Baraka* reflect the emergence of a beur culture in the 1980s. The main objectives have been to combat racism, preserve and stimulate the socio-cultural scene in residential areas, secure the educational advancement of youth, maintain civil rights and increase political participation. Thus the children of north African immigrants have become an active part of French society and can now command new respect.

In 1985 a new association called France Plus was launched under the leadership of Arezki Dahmani, an economics lecturer of Algerian origin, with powerful backing from the Party Socialist (PS). It entered electoral politics with the specific aim of promoting beur candidates and politically mobilising young men and women from the immigrant community who already had political rights being French nationals. In the municipal election of March 1989, out of 572 candidates of north African origin of France Plus about 390 won the elections. Although France Plus failed to repeat the formula in the European elections held a few months later, two young women of Algerian origin were elected on French lists. Nora Zaidi, a regional leader of SOS Racisme in eastern France won a seat on the PS list while Djida Tazdait, president of Jeuns Arabes de Lyonet sa Barlieue (JALB-Young Arabs of Lyons and Suburbs) won hers with the ecologists. France Plus works as a civil rights organisation, encouraging naturalisation and registering people to vote and bringing anti-discrimination law suits.[11] France Plus has emerged as the most effective association throughout the French territory. Undoubtedly this marks the beginning of a new era and the emergence of a new political force.

Thus a decisive and tangible step towards political participation has been achieved. The beurs have begun to be officially integrated. What remains to be demonstrated now is the extent to which this political integration is likely to deal with the socio-economic marginalisation of thousands of the north African immigrants' children in French society

France Plus opposes the idea of multiculturalism. It supports French national attempts of integration through assimilation. It asserts the right to be the same, whereas SOS demands separate ethnic identity, i e, right to be different, and multiculturalism. There is an apparent difference in thinking between the children of the 'harkis' (those Algerians who fought with the French army against Algerians during 1952-62 war) and the children of the actual Algerian immigrants.[12]

Role of Beurettes

The most adamant about their Frenchness are the young beur women, the 'beurettes'.

The spatial mobility of the females, especially that of young girls, is still often controlled within north African families although they are not requested to wear the traditional veil when they go out of the home.[13] It is a means of avoiding contact with western society and ensuring a certain impermeability symbolic of purity of the inherited culture and a means of preserving identity. Brothers (beurs) treat their own sisters in a more conservative way than would their fathers, especially where it concerns the issue of going out. Today those beurettes who were born in French cities are not allowed to go out freely and without any kind of control. There is a compulsion to get married at an early age of 17-18 and also within the community, which in some cases results in a 20 or more years' age difference between husband and wife. Such constraints sometimes result in runaways, suicides, drugs and prostitution.

If France's secular education system has enabled individuals to better themselves socially, it has also been a major factor in the cultural tensions experienced by youths from immigrant backgrounds in relation to their Muslim parents, especially pronounced in the case of teenage girls. For the beurettes education is the ticket to the freedom and equality their mothers could not dream of while in the rural Maghreb.

Beurettes participated in the autumn 1983 march to the president's office. However, when they realised that their problems are not considered significant, they formed their separate associations. There are many associations of immigrant women, prominent among them are Les Namas Beurs, Expression Maghrebin au Feminin in Paris. The studies show that beurettes could be characterised by a greater left wing radicalism and political activism than is found among their brothers, and that they display less attachment to their cultural and family background.

It is also worth noting that in the 1989 municipal election out of the 50 female candidates of France Plus, 42 were elected. Now many cities have a beurette as deputy mayor.[14]

Despite the election of some candidates of north African origin at local, national and European levels, in the coming years there will be thousands and thousands left out and marginalised. For the majority of children of north African immigrants in France, equality of opportunity in education, vocational training, housing and employment will not be achieved for a long time. In this situation many of them could turn to Islam to rebuild an identity. The beurs' representatives face a major problem in the absence of an organised north African community in France.

However beurs have become effective pressure group in the form of identity politics, as political intermediaries or as a forum for ethnic lobbies.

Notes

[The article is based on the data collected during my short stay at Paris in September/October 1993 under the Indo-French Fellowship sponsored by University Grants Commission and Maison Dessciences De L'Home, Paris.]

Nuclear Pilferage in Russia

R G Gidadhubli

Russia has become a fertile source for the illegal trade in nuclear materials given its large numbers of retrenched army personnel, inadequate defence budgets and underpaid or unpaid staff.

REPORTS about Pakistan's latest clandestine act to smuggle out plutonium, allegedly of Russian origin which was exposed in Germany in the third week of August 1994, has created legitimate concern for India. In fact, besides Germany several western countries including the US have expressed deep concern over this incident which will cause a threat to international security. Notwithstanding the fact that Russia has entered into an agreement with Germany against the smuggling of nuclear materials, the present episode once again uncovers the plight of Russia's defence sector in general and the phenomenon of theft and pilferage of defence-related materials in the ex-Soviet Union.

There are several dimensions to this sensitive issue. Perhaps one of the major factors contributing to this situation is the inability of the Russian government—and this may apply to other republics of the former Soviet Union (FSU)—to exercise full control over their own defence industrial enterprises. In contrast to the total control in the past in terms of production, sale and funding of defence enterprises, under changing conditions such enterprises are expected to manage themselves. Several enterprises categorised as defence units in the past produce many civilian products under the defence conversion programme which has further complicated the task of control by ministries.

Equally important is the fact that there are deep cuts in defence budget after the Soviet disintegration involving retrenchment of defence personnel many of whom are unemployed and are in poor material condition. Defence enterprises are unable to get funds even to pay wages for workers. The defence ministry in Russia is reported to be in huge debt amounting to billions of roubles to enterprises which produce defence goods and for which they have not been paid. Vasiliy Vorobyov, the head of the defence ministry's chief budget and finance board has stated (ITAR-TASS, May 12, 1994) that the Russian military budget of 37 trillion roubles for 1994 did not guarantee even the survival of the Russian army. According to him with this meagre budget, defence personnel may be paid salaries at intervals of two-three months. The situation is even more alarming for financing allocation for the production of armaments, military hardware, etc. Not getting their wages for months, workers of several defence industrial units and nuclear power plants have threatened to go on strike in contravention of the law. In order to run their own units, several enterprises have resorted to mobilising resources by exporting defence equipment and parts. While this may be legitimate, part of such sales may go to final destinations on which neither the enterprise nor the Russian government may have ultimate control. There were recent reports about Pakistan trying to obtain defence equipment from Russia including the most sophisticated SS-30 fighter planes which are comparable or even superior to American F-16 fighter planes.

But far more threatening and dangerous are illegal acts including theft and pilferage from defence enterprises in Russia and possibly in other CIS countries. While theft did exist in the Soviet era, they were few and far between by virtue of strict vigil and control exercised by all concerned agencies including the defence ministry organisations, the Communist Party, the KGB and above all the threat of severe punishment. At any rate they were not reported. With relaxation under Gorbachev's policy of perestroika, the situation was undergoing a change for the worse and that included frequent illegal trade in arms. There were occasional reports about easy availability of small arms including pistols, rifles, etc. Over time a class of 'unorganised' traders, a Russian phrase for mafia groups, started emerging having links with unscrupulous elements in defence industries for easy money. How serious a dimension this had assumed in the FSU became known with the exposure of the scandal involving the sale for export of new 20 T-72 tanks as scrap in 1989-90.

After the Soviet disintegration, in Russia things have been going on from bad to worse. As quoted by a Russian paper, reports of arrests of Russian citizens attempting to earn foreign currency from trading in radioactive materials from Germany, Hungary or Poland are not uncommon. At times they are caught in Russia itself. One such event was known on June 7, 1994 when Interfax Moscow reported confiscation of 3.05 kg of uranium dioxide (the share of uranium-235 isotopes is 90 per cent) valued at $ 1 million in St Petersburg by the Russian Federal Counter Intelligence Service (FCIS). Subsequently, a Moscow daily paper *Novoya Yezhednevnaya Gazeta (New Daily Paper)* elaborating on this issue reported on June 9, 1994 that this was a highly enriched weapon grade raw material destined for foreign buyers and that it was stolen from an enterprise near Moscow about which the Russian president Boris Yeltsin had been informed. FCIS arrested a butcher and a plumber who had managed to steal this material from the factory but the real culprits of the network may be different.

One thing is certain. This is not an isolated incident. The Russian press—*Argumenti i Fakti*, *Komsomolskaya Pravda*, *Moscow News*, *New Daily Paper*, etc, to name a few—should be credited with exposure of such incidents. An incident worth mentioning in the present context is the investigative reporting by the *New Daily Paper* of Moscow in the Fall of 1993. The paper exposed illegal trade prevailing in Russia of weapon grade highly enriched uranium and plutonium. Notwithstanding denials by the Russian minister of atomic energy V Mikhaylov of theft and illegal trade, correspondents of this Moscow paper posing as buyers of fissionable materials were able to acquire these materials in Moscow which was subsequently confirmed by the experts of the ministry of security of Russia. The same paper also reported about SS-20 warheads being found in private hands (*New Daily Paper* in Russia of June 1994).

It is not uncommon in Russia that 'unorganised' traders sell radioactive materials as strategic raw materials waste. Under this pretext not only minimally enriched but real uranium is also sold by these traders who know very well that one gram of uranium which is used in the atomic industry is worth US $ 300. This shows that big money is involved in this trade the network of which may be operating not only in Russia but also in other republics of the former Soviet Union.

Thus Russia has possibly become a fertile ground for 'illegal' trade in nuclear defence materials with all prerequisites—an army of retrenched and unemployed defence personnel struggling for survival; laxity in government control; chaos encompassing political, economic and social spheres; growing disparity between the rich and the poor; inadequate defence budget; and above all attraction of big money motivating individuals to take risk. Though the task of tackling this is quite formidable, the latest event of the detection of smuggling of plutonium in Germany has put pressure on Russian authorities to take serious steps against illegal trade in fissionable materials in Russia, failing which Russia may lose generous western economic assistance for transforming its market economy besides its credibility among nuclear powers.

Throughout India, each of the 583 strong branch network, is daily establishing new relationships with customers, winning their confidence and appreciation.

Long before the new wave of liberalization, which in its wake has ushered in competitiveness in every field of business, the Oriental Bank of Commerce had planned and focussed energies towards customer satisfaction.

CUSTOMER - ORIENTATION: THE FOUNTAINHEAD

We believe that customer - orientation is the first step towards customer satisfaction. More than just the physical action, customer-orientation is an attitude of the mind, born out of a strong sense of conviction and commitment to the organization. Which is a two-way relationship, hence the corporation has to be equally committed to the individual. And this is exactly what we at the bank have aspired and achieved. All the result of an 'Open-Door-Policy' of the managers.

UNDERSTANDING CUSTOMER BUSINESS

Teaching by example has been the backbone of the 'HRD-revolution' at the bank, where all the top managers were encouraged to take initiative, meet customers and cut down red-tapism. This necessitated our managers to first thoroughly understand the client's business, his special circumstances, the SWOT of the business and only then to arrive at the financial needs of the client—the amount required. After all money costs money.

CARING FOR THE CUSTOMER

This customer-orientation has pervaded all levels of the bank. Today, customer care is everyone's responsibility. Each individual perceives this, accepts it and acts on it. People in the bank realize that there is only one way to have a successful bank and that is to have a lot of happy and satisfied customers.

REACHING OUT TO CUSTOMERS

Ever sensitive to the changing economic environment and the new competitiveness in banking, the Oriental Bank of Commerce is responsive to the new challenges. In this new spirit the Bank has started a dynamic programme of reaching out to customers.

OPERATING FROM A POSITION OF STRENGTH

It's not corporations who create excellence but the individuals, who have transcended independence in work culture and who are matured for 'interdependent' relationships where professionals in the team cooperate with each other, rather than compete. Building further on each other's strengths. Taking the bank to new horizons of excellence.

Individuals operate from a position of strength, appreciative of the trust and confidence of the bank in them. The executives at the Oriental Bank of Commerce take initiative and 'walk the extra mile' to ensure customers' satisfaction.

WHEN LOSSES OCCUR

We realize that in the fluctuations of business, sometimes, losses also occur. If the loss is 'genuine' and if the entrepreneur exhibits the willingness and determination to convert failure into success, then we are willing to discuss strategies. Willing to be pragmatic in our approach. It is this approach of 'business-partnership' that has led to a mutually beneficial relationship. Ensuring the profitability of the bank and its customers.

SPECIALIZED SERVICES

To cater to the specialized needs of the customers, specialist-branches have been strategically located needwise for the following: Industrial Finance, Small Scale Industries, Agriculture, NRI, Foreign Exchange etc. Specialists who are steeped in the various facets of the concerned area of activity interact with customers like 'virtual-business partners'. Giving the customers an extra dimension for their success.

GLOBAL NETWORKING

For customers with eyes on the global markets, we are on the international wave length in telecommunications through 'SWIFT', Brussels, the satellite communication systems to which leading global organizations are hooked for instant information. Besides, the Oriental Bank of Commerce has arrangements with 118 foreign banks and operates the NOSTRO account in 17 leading currencies of the World.

GROWTH OVER THE INDUSTRY

With such dynamism and vision of its people, no wonder the Oriental Bank of Commerce is achieving a growth rate of 23.4% which is much higher than the average growth rate of the banking industry of 16.8%. Importantly, the bank ever since its inception, has made profits, year after year, every year

Moreover, we at the Oriental Bank of Commerce have achieved the norms of RBI for Capital Adequacy much before the scheduled date of 31st March 1996! Very clearly reflecting the speed and commitment of the individuals in the bank.

GOING PUBLIC

The Oriental Bank of Commerce will be the first of the nationalised banks to go public. Once again establishing that speed and dynamism is the hallmark of the bank.

YOUR PROSPERITY—OUR AIM

The sum essence of the corporate philosophy, mission and performance has been embodied in our corporate slogan—'Your prosperity—Our aim'.

Satyamurthi: The Link that Snapped

S Theodore Baskaran

S Satyamurthi, the nationalist leader, played an active role in establishing the unique interaction between the entertainment media and political life in Tamil Nadu which continues to this day. Had later Congress leaders sustained this association and not allowed the Dravidian movement to appropriate it, the political history of Tamil Nadu might well have been very different.

THE interaction between entertainment media and political life in Tamil Nadu continues to intrigue observers. Since 1967, all the five chief ministers in this state have been associated with the film world, the first two as script-writers and the other three as actors. This association has a long history, going back to the early days of the freedom movement in this part of the country. S Satyamurthi, the nationalist leader, played an active role in establishing this interaction, a role that has not been studied. Had this association between the Congress and the entertainers been continued, even after Satyamurthi, the history of Dravidian movement and of Tamil Nadu could well have been different.

Born in 1887 at Tirumayam near Pudukottai as a son of a lawyer, Satyamurthi graduated from Madras Christian College. After his law degree, he joined the bar at Madras but was soon drawn to politics. In 1919, at a Congress conference in Kanchipuram, he made his political debut. His spirited attack on the ideas of Annie Besant attracted the attention of Sarojini Naidu and other leaders who spotted him as a potential publicist for the party. Soon he came to lead a Madras-based faction of the Congress, the Nationalists. His fluency in both English and Tamil, coupled with his oratorical ability, came in handy as he played this role with confidence. The speeches he made in England during his 1925 tour helped in projecting the Congress point of view. From 1923 to 1930 he was a member of the Madras Legislative Council. He was very active in the Civil Disobedience Movement and it was at this time that he got closer to the artistes of the entertainment world and brought many of them into political activism.[1]

Satyamurthi was elected to the Indian Legislative Assembly, Delhi, in 1935, where he left a memorable record as a debater and as the deputy leader of the Congress Party. When the Congress contested the elections in 1937, he led the election campaign, for which he harnessed the support of stage and screen artistes. He then became the Mayor of Madras. Till he died in 1943, he kept up his active association with entertainers.[2]

He got interested in the world of entertainment when he started his legal practice in Madras. The amateur drama club, Suguna Vilas Sabha, founded by a Madras-based judge, P Sambanda Mudaliyar in 1891, was by that time active and was offering a forum for those interested in theatre. This was an elitist forum, in which bureaucrats, lawyers and other professionals took part, as distinct from the commercial drama companies that were very popular at that time. Satyamurthi joined this troupe and acted in a number of their productions; his performance as the jester in the Sanskrit play 'Mrichakati' and as Manoharan in 'Manohara', within a week after taking over as the president of the Tamil Nadu Congress Committee, were memorable.[3] After watching 'As You Like It' at the Memorial theatre at Stratford-on-Avon in England he said "I visited the place as a pilgrim from Suguna Vilas Sabha".[4] He was elected as the vice-president of the Sabha and later held the office of 'Tamil conductor', which meant that he was entrusted with the work of directing Tamil dramas.[5] When he got active in politics, he realised that to build up a popular political basis for the Congress he needed a different connection and the world of commercial drama was there to be tapped. In fact, as early as 1992 Motilal Nehru had written to Satyamurthi about gathering support for his faction in the Congress "yours is truly a benighted province in this matter... I doubt very much that we shall have any appreciable number to support us unless an intensive propaganda is at once started."[6]

Popular Entertainment and Politics

The itinerant commercial drama companies provided the most popular entertainment during this period. These troupes had appeared by the last decade of the 19th century and in two decades had emerged as a major entertainment form; soon many companies came to be established and were touring around the presidency. There were companies and that had only boys and some only women. Their repertoire was quite limited, mostly episodes from mythologies; the plays were mere vehicles of songs, like an opera, and so the actors has to be singers. There was a corpus of songs that had been popular on the stage and often the stage actors gave independent concerts featuring these songs. The gramophone records industry, coupled with the import of inexpensive gramophones from Japan, widened the appeal of these songs. In spite of such popularity, the company dramas were looked down upon by the upper classes and the artistes of these drama companies were treated like outcasts.

The surge of anger that erupted in the wake of the Jallianwala Bagh massacre of 1919 drew these entertainers into the vortex of political activity. With the print media under severely restrictive censorship, the stage became a convenient forum to attack the policies of the British government. The songs from these plays spread the message of nationalism aurally. Off stage, the actors participated in demonstrations and picketings. Satyamurthi, recognising this tremendous potential which could be used for propaganda purposes in nationalistic struggle, began to associate himself with this group. They, in turn, responded positively. One of Satyamurthi's favourite statements from the platforms was "we shall win our way to freedom, singing".[7] The stage artistes found themselves in active political life, acquiring in the process a new respectability which they had hitherto lacked. They could appear along with leaders on political platforms, a possibility they could not have dreamt of earlier. This was an added incentive to be politically active. It must be remembered here that the political leaders so far had been totally ignoring these artistes as of no consequence. It was Satyamurthi who first established a nexus between political leadership and the world of popular entertainment.

One of the earliest links Satyamurthi forged with entertainers was M M Chidambaranathan, an actor of the company drama, who had been trained and inspired by nationalist poet Udumalai Sarabam Muthusamy Kavirayar. In 1921 when Satyamurthi led picketing in Madras as part of the Non-Cooperation movement, Chidambaranathan organised many performances of patriotic plays and, in addition to the propaganda, gave the gate collections to finance the demonstrations.[8] There were also other troupes staging patriotic plays and when the British government banned some of them, Satyamurthi, who had by this time been

elected to the Madras legislative council, raised the matter on the floor of the house. When neither the press nor the political leadership was prepared even to acknowledge the existence of these artistes, Satyamurthi, by advocating their cause, won their loyalty and they looked upon him as their spokesman and leader. From then on he involved these artistes in all his political programmes. When in 1928, Satyamurthi was appointed the president of the Simon Boycott Propaganda Committee of Tamil Nadu Congress Committee to carry on an intensive campaign, his contact with the entertainers came in handy.[9]

Potential of Cinema

Tamil talkies emerged as a popular entertainment form, in the early 1930s and artistes from the stage—playwrights, actors, song-writers and musicians—moved *en masse* into the glittering world of cinema where the advent of sound had created a demand for them. Many well known stage names quickly gained screen fame. With them they took their repertoire of nationalistic dramas and songs. The very first Tamil film 'Kalidas' had a song totally unconnected with the story of poet Kalidas, extolling the charkha. Soon films began to be infused with nationalistic propaganda. Satyamurthi recognised the potential of cinema as an instrument of change and showed keen interest in its development. He began writing about it. He said that cinema was to play a major role in the coming years and that in a country with so much of illiteracy, its influence was bound to be strong. In an article in a daily he wrote "I hope there will be a synthesis established between the film producers in India, the directors and the leaders of the nation. The film should be made to comprise a purposeful part in Indian Renaissance."[10] When the film 'Nandanar' (1935) was released, he wrote about its implications for the non-brahmin movement, the protagonists of which he was bitterly fighting in the political arena.[11]

Among the political leaders of India of that period, Satyamurthi had established a reputation as being fiercely independent. His association with film artistes, disregarding the breath of scandal that floated around, was only one such act that gave rise to such an image. He openly opposed Gandhi in the All-India Congress Committee meeting at Ahmedabad on March 1, 1930. He did not think that prohibition was an important cause or that it should be given priority over other issues. He confessed in public, his disillusionment with non-violence as a political weapon.[12] Speaking at a meeting of the European Association in Madras on May 20, 1936, he criticised socialism.[13] When the Congress decided to resign from power in 1939, protesting against the war, Satyamurthi opposed the idea.

At a time when the educated elite despised cinema as a plebian preoccupation and refused to consider it seriously, Satyamurthi pointed out its importance. In 1939, in the senate of the Madras University, he pleaded for the introduction of cinema as a subject, but the idea was rejected, much to his anger and disappointment.[14] He hoped that Indian film industry would be able to bring in cultural swaraj and pleaded that educated women should join films and improve it. He was often invited to preside over the premiere of a film or to inaugurate the shooting. When the film 'Iru Sahodharargal' was released in the Elphistone cinema house at Madras, Satyamurthi persuaded Rajaji to attend. The proceeds of this show went to the Patel Purse fund.[15] He also took note of the charisma these film actors were acquiring and used it effectively.

Influence over Film Stars

Satyamurthi exercised considerable influence over film stars. Though cinema was looked down upon as a low class entertainment, he could persuade classical musician Maharajapuram Viswanatha Ayyer to act in the film 'Nandanar'.[16] While honouring the artistes of the film 'Tirunilakantar' (1939), Satyamurthi requested M K Thyagaraja Bhagavathar, the leading stars of the 1940s, to give up silk and wear only khadi to which he agreed.[17] When a felicitation was organised for the actor director Raja Sandow, it was Satyamurthi who presided over the function. He won over film actor Nagaiya to the nationalistic cause and sent him as a delegate to the Congress session at Gauhati. All these artistes, in turn, lent their charisma to support the party.[18] However, Satyamurthi's fascination with film stars at times went beyond their usefulness, in propaganda. He wrote to Gohar of Bombay, the star of the Silent era, to send an autographed photo, which she did, with a note, "I will be greatly delighted to meet you whenever you come to Bombay".[19] They did meet later, when Satyamurthi went to Bombay to participate in the silver jubilee celebrations of Indian cinema in Bombay in 1939.

During the Civil Disobedience Movement, with all the other leaders in jail, Satyamurthi found himself the president of the Council of Action.[20] Many celebrities from the screen and the stage took part in direct political action. Dramatist Akkur Ananthachari was in charge of the movement in North Arcot district. Famous film artistes of the period, K S Ananthanarayanan ('Alli Arjuna', 1935), K S Devudu Ayyer ('Radha Kalyanam', 1935), M V Mani, ('Sathi Leelavathi', 19 and M G Nataraja Pillai (Dhakshayag 1935), participated in picketing and cou arrest.[21] Film-maker and founder of first sound studio in south India Narayanan, a friend of Satyamurthi, his support to the movement and organ a bonfire, of foreign cloth.[22] K S Go krishnan, actor ('Jalaja', 1938) and dir ('Madanakamarajan', 1941) organis All-India Swadeshi Exhibition in Ma to subsidise the Salt Satyagraha camp in Madras and also conducted a m festival in which Semmangudi Srini Ayyer sang and Balasaraswathi danc By identifying themselves with s popular causes these artistes amplified t own popularity.

Satyamurthi's concern and interest w the world of cinema culminated in election as the first president of the So Indian Film Chamber of Commerce in 19 for a term of three years. It was he w drafted the memorandum of articles gave the organisation the initial momentu In the same year he led a contingent to silver jubilee celebrations of Indian cine and the Motion Picture Congress at Bomb over which he presided. In his talk he s "The propaganda value, the techni and the appeal of the films will thus the very best possible. It can in fact made into a nation-building force in true sense of those words. With popu governments and Congress governme functioning in the various provinces, th is unlimited scope."[25] He believed cine could be used to drum up mass support the Congress and to tackle social probl like illiteracy.

Penchant for Election Campaigns

Satyamurthi had always shown a pench for election campaigns. From 1921 onw he had insisted that the Congress sho enter the legislatures. This was the plan Swarajists, a faction of nationalists which Satyamurthi identified himself, he was able to get financial assistance f C R Das and Motilal Nehru which ena him to start a newspaper and to build a c of publicists.[26]

One of the principal aims of Satyamu in contesting the elections was to disp the Justice Party, the political ancesto the Dravidian parties, from the legisla When the 1935 constitution brough provincial autonomy and liberally expa franchise, the need for mass medi electoral campaigns arose. He realised in this changed scenario, the film stage artistes, with their unpreceden popularity, could be an effective tool campaigns. Many well known figures the world of entertainment extended support to the Congress in its camp

When the party decided to contest the elections in 1937, T K Shanmugam, the leadman from one of the most successful troupes of the period, TKS Drama Company and a film actor ('Menaka', 1935), campaigned for Congress in the villages around Coimbatore. Their method of campaigning was to sing or make a political speech. Their popularity as actors ensured that their very presence drew large crowds.[27]

The film artiste who played the most high profile political role was K B Sundarambal, star of the film 'Nandanar'. Influenced by her uncle, Malaikozhundhu Gounder, a Congress worker, Sundarambal joined the nationalist movement and became a close associate of Satyamurthi. Earlier, when she was reluctant to enter the world of cinema and was still mourning the death of her husband stage-star S G Kittappa, it was Satyamurthi who persuaded her to sign the contract for the film 'Nandanar'.[28] Similarly, to persuade her to campaign for Congress, Satyamurthi accompanied Gandhi, during one of his visits to Madras, to Sundarambal's house.[29] She campaigned hard for the Congress in the 1937 elections. The pattern was for her to sing patriotic songs first and this would be followed by a speech by Satyamurthi. A gramophone record was also released with a song of Sundarambal on one side appealing to voters to support Congress and a speech by Satyamurthi on the other. Throughout her life she wore only khadi and remained a loyal supporter of Congress.

Pioneer film-maker A Narayanan made a short film supporting the candidature of Satyamurthi in Madras. The film, of just a few minutes, featured Bhulabhai Desai and Satyamurthi appealing to voters.[30] Thus Satyamurthi harnessed all popular entertainment forms—cinema, drama and gramophone—in widening and deepening political activism in the nationalistic cause. In this process, he brought the entertainers under one flag and gave them a cause to work for. Thus Satyamurthi pressed into service the most widely used, contemporary media artefacts, songs, discs and film. These unorthodox methods of election campaigning proved quite successful. Congress came out victorious with a phenomenal majority compared to the other provinces in which it had won. Out of the 215 seats, Congress got 159.

CONGRESS LEADERSHIP'S DISDAIN

In the Congress Satyamurthi acted as a bridge between the lowly field worker and the top leadership. With remarkable foresight he was able to observe the cultural experience of a vast majority of people and realise that popular culture was emerging as a force that could transform the political scene. The Congress leadership, on the other hand, refused to take cognisance of this development and treated it contemptuously as being purveyors of cheap entertainment. It was one dimension of elitist apathy to popular culture.

In spite of the support from the drama and cinema artistes extended to the Congress, the other leaders in the party failed to appreciate the role they were playing in building up a strong, populist base for their party. Nor were they able to foresee the dimensions cinema was to assume. Gandhi, with whose arrival on the scene the politicisation of the masses began, failed to take cognisance of the work of these artistes. His attitude to the entertainment media was typical of that of the Congress leaders. In 1938, for the 25th anniversary of cinema, a Bombay film journal asked Gandhi for a message and received the following reply from his secretary: "As a rule Gandhi gives messages only on rare occasions and these only for causes whose virtue is undoubted. As for the cinema, he has the least interest in it and one may not expect a word of appreciation from him."[31] Satyamurthi's political rival in the Congress, Rajaji, who was seen as undermining his power base in Tamil Nadu, did not take kindly to the entertainment world which was so supportive to Satyamurthi.[32] While the British government at the centre and the Justice Party at the provincial level were Satyamurthi's targets of attack, his rival within the Congress was Rajaji. Even in the early 1920s, when Satyamurthi led a faction known as the Nationalists, Rajaji headed the other faction. Satyamurthi hoped to get the prime ministership of Madras province and was disappointed when he lost it to Rajaji. In their approach to the world of entertainment also, their opinions were diametrically opposed. Rajaji's views on cinema were puritanical and he had asked people to refrain from watching films. In

1955, as chief minister presiding over a meeting of film celebrities, he described cinema as "poison" and said that if it could terminate itself, it would be an extraordinary service.[33] Even Kamaraj, a protege of Satyamurthi, who succeeded Rajaji as the chief minister of Tamil Nadu, was quite disdainful of this group and contemptuously referred to them as 'Koothadigal' (mountebanks).[34] Satyamurthi died in 1943 and the Congress leadership in Madras province passed on to Rajaji.

Legacy Passes to Dravidian Movement

While fighting the British government at the national level, at the provincial level Satyamurthi was constantly trying to outmanoeuvre the Justice Party, the ideological forerunner of the Dravidian parties, and kept it at bay. As long as he was in the field, they could not make much headway against his campaign skills. His principal object in persuading the Congress to enter the legislature was to evict the Justicites. He fought the Justice Party in the 1926 elections for the provincial council and defeated it, bringing to an end the first six years of that party's rule in Madras. The Justice Party opposed the Congress, voicing the fear that if the British handed over power to that party, it would only perpetuate the dominance of brahmins in the province. [35]

Satyamurthi had consistently opposed all that the Justice Party and the later Self-Respect movement stood for. He, who had studied Tamil only up to his fourth standard in school, believed that Sanskrit should be accorded a prime place and declared that he looked forward to the day when Hindi would be the national language. He was orthodoxically religious; professed belief in astrology and horoscope. He advocated early marriage for women—about 15 years as the ideal age—and opposed inter-caste marriage.[36] He took a position against the efforts that were on in the province to establish the Dravidian identity.[37] After he died, the artistes from the world of entertainment, leaderless and directionless, gravitated towards the Dravidian movements, whose leaders offered them recognition and patronage. In fact many of the leading lights of the movement, C N Annadurai and M Karunanidhi, were themselves playwrights and often acted in plays. It was they, the Dravidian leaders, bitter political enemies of Satyamurthi, who eventually inherited the force that he had assiduously nurtured and used it in their ride to power, creating the phenomenon of star-politicians.

The Dravidian movement, which was widening its mass base, first began using the stage for its propaganda and many artistes joined the movement. Later when Dravida Munnetra Kazhagam was formed in 1949, stage and film artists also came in as handy tools for propaganda; the party's first organising committee included K R Ramasamy, a film star, and T V Narayanasamy, a drama actor. Film star N S Krishnan was one of the main supporters of the party.[38]

In fact the career of N S Krishnan, who dominated the Tamil film scene for more than two decades as a comedian and acted in more than 100 films, epitomises the fortunes of the stage and screen artistes on the political scene. From the time of the Civil Disobedience Movement, Krishnan had been active, carrying on political propaganda for the Congress. He wrote the story of Gandhi's salt satyagraha as a 'villu pattu', a traditional form of musical narration and performed it as a part of Swaminatha Sarma's famous play 'Desabakthi' and later as separate shows. After independence, during the first election 1952 Durgabai Deshmukh persuaded him to contest as a Congress candidate from Madras. When Krishnan was in Delhi finalising this, some Congress leaders of Madras ridiculed the idea saying that a 'komali' (clown) should not enter the legislature. Piqued, Krishnan refused to contest.[39] Later, he lent his charisma to the Dravidian movement and was of valuable assistance in building up the Dravida Munnetra Kazhagam, though he was never a member of the party. S S Rajendran, a lead player of the nationalistic TKS Drama Company, joined the DMK and became the first film star to be elected to a legislature when he won from Theni constituency for the Tamil Nadu assembly in 1962. Later he became a member of parliament also. M G Ramachandran, the best known star-politician of the Dravidian movement, as a company drama artiste had acted in the nationalistic play 'Kadarin Vetri' and was a khadi-wearing Congress sympathiser before he joined the DMK.

Forms of Compulsion

Nigel Harris

Riding the Tiger: The Politics of Economic Reform in Post-Mao China by Gordon White; Macmillan, London, 1993.

Slaughter of the Innocents: Coercive Birth Control in China by John S Aird; AEI Press, Washington, DC, 1990.

SINCE the late 1970s, economic growth in China has been breathtaking. Indeed, never in the history of the world have so many people been affected by radical economic transformation. Gordon White's book is directed to reconstructing the political process which unleashed and facilitated this remarkable pattern of development. The structure of the book covers some theoretical preoccupations which underlie his account and a historical reconstruction of why the old model of development, associated with Mao Tse-tung, failed. He provides an overview of the reforms, in-depth examinations of the reform package in agriculture and in industry, and then an examination of the implications of these for the ideology of the regime, for the Communist Party, and for the development of Chinese civil society. He concludes with a critical examination of the idea of 'market socialism'.

In general, the book is excellent, well argued and written, supported by a wealth of documentation and data, in sum an admirable overview of an immensely complex and, in many respects, opaque process. If one has disagreements, they arise over a degree of uncertainty of touch in the historical account, a kind of residual Maoism, which seems to overestimate the capacity of the Chinese leadership—and in particular, those around Mao—to freely make choices about what sorts of economic model to pursue, as opposed to being pushed into reactive behaviour whether of domestic or foreign origin, behaviour which in turn imposed a new logic on the regime and its policies. In fact, as White's argument develops, this is precisely the direction in which he proceeds, excellently showing how, having introduced economic reforms on a limited basis as a reaction to one set of problems, the 'tiger' of the title takes its own direction—and the flimsy rationalisation of 'market socialism' fades into a 'social market' and the 'social', like the smile on the Cheshire cat's face, gets pretty faded in the sweatshops of Guangdong):

> To the extent that the reforms do in fact achieve their economic aims, however, they set in train basic social and political changes which undermine the legitimacy and effectiveness of the previous state-socialist policy. Thus, economic reforms not only fail to restore the legitimacy of Marxist-Leninist socialism; they accelerate its political breakdown (p 12).

There is a different kind of problem in detecting how interests relate to the broad policy options as well as to events. Most accounts of China deal in a division of 'conservatives' and 'reformers', and while some of the leaders are apparent here, it is not clear how these positions—with their variations—relate to the structure of China's establishment and the different kinds of places each occupies. Mao himself was never one or the other in general, but famous—or notorious in the old Comintern—for his 'pragmatism' and, in that sense, Deng Xiaoping is his natural heir. Flexibility of reaction was always a mark of the Chinese leadership, shifting relative to the omnipresent threats from abroad and home, but always adhering to the central aim, through conservatism or reform, of a strong China under their direction. This raises an even stronger criticism of 'market socialism'. For the reforms subject China's economy to world markets, rather than simply introducing carefully controlled elements of domestic competition.

This is relevant to the book's discussion of the demise of planning. In the old ideology, planning was fundamental as supposedly an instrument of class power over society, the imposition of 'democratic' decisions upon the economy so that it could be shaped to achieve the will of the class alliance alias the Communist Party. Without planning, there is no instrument, so the whole project of 'socialism' is abandoned. With the opening up of the economy, the central directions derive from global patterns of specialisation, themselves determined by the form of accumulation of world capital, not the Chinese state.

However, this somewhat esoteric preoccupation is perhaps remote from the preoccupations of the Chinese leadership (White excellently shows the ideological slither taking place, one which suggests that provided China becomes a strong power, the phraseology can be adjusted as events unfold). However, White shows that the reform programme radically changes the context facing the Chinese leaders, creating powerful interests that resist any attempt to reverse the process. Indeed, the country now seems well beyond the point of no return, and Beijing's capacity to impose any new direction upon the country has grown increasingly feeble. Here more discussion would have been welcome on how far the old nexus of power, the complex of central bureaucracy, state industry, banks, military and police any longer constitute a coherent entity, how far has China become, willy-nilly, a *de facto* federation of provincial powers and autonomous national fiefdoms. The discussion of centre-local relationships is relatively slight, even though this determines the capacity of the centre to act. How far do the more powerful provinces regard Beijing with impatience or contempt?

However, these points are the result of the excitement generated by the book, rather than meant as negative comments. We are much in the author's debt.

* * *

During the Emergency period of Indira Gandhi's government between 1975 and 1977, the administration sought to follow forcefully the remedies for India's problems which derived from the conventional wisdom of international agencies and some domestic opinion—that is, that the growth of India's population constituted a profound threat to the future of the country, and that the growth of the world's population threatened to destroy humanity. While not condoning the countless careless savageries of Sanjay Gandhi's campaign of sterilisation in Uttar Pradesh, it needs to be said that if the diagnosis is correct, it would be irresponsible not to seek by all possible means to *enforce* birth control by whatever means was most effective or acceptable. To permit scruples concerning human rights to stand in the way of a process which supposedly threatens to destroy us all would clearly be irrational; as in war, extreme measures would be required.

The Chinese leadership has also come to be committed to the same diagnosis, and given the powers attached to a centralised and authoritarian government at national and provincial level, has been able to pursue the resulting policy implications with much greater thoroughness and persistence than was ever possible in India. This is the sombre theme of the study by Aird, formerly the leading China specialist in the US Bureau of the Census. In 89 pages of tight analysis, backed as is absolutely required by 71 pages of detailed references to the Chinese sources, he outlines the historical development of Chinese population policy—through the phases of optimism when the more people China possessed, the more hopeful it should be (in the years up to 1953,[1] or during the

(Great Leap Forward), those of growing doubts, and those of increasing ferocity of enforcement (in the early 1980s and from 1985). It is, as one would expect, a very careful and exhaustively documented account of what has become the most rigorous—and in effect, compulsory—programme of birth control in the world, directed to achieve a one-child family for all and a limit to the population of China of 1.2 billion by the year 2,000.

Aird is particularly concerned to show that this coercive policy is supported by the United Nations and other population agencies, even though all are supposedly obliged to support only voluntary birth control programmes. The UNFPA has given financial assistance to the Chinese government since 1980, and in 1983, the first two UN Population Awards were made to China's ministry in charge of the Family Planning Commission and to prime minister Indira Gandhi.

The forms of compulsion employed are elaborate, change over time and vary between localities—from a case of denying food, drinking water and electricity to non-complaint families in the 1970s to 'mass mobilisation' sessions, special study classes from which pregnant women are not released until they agree to an abortion, heavy fines (monthly fines for unauthorised pregnancies which continue until the woman agrees to a termination), loss of employment for urban families and revocation of land contracts for rural, collective punishments for work units or localities,[2] fines for the illegal removal of IUDs or for refusing to have one inserted (with the ultimate sanction of sterilisation for persistent offenders).

The aims of the campaigns have become increasingly precise—the sterilisation of one partner in every couple with more than one child, abortion for unauthorised pregnancies, enforcement of late marriage and late authorised births, the elimination of illegitimate births. Aird cites a set of Yunnan targets for implementation by the party cadres: 90 per cent of child-bearing women with one child to have an IUD insertion; 90 per cent of those with two children or more to have tubal litigations; 90 per cent of unplanned pregnancies to have abortions. Aird examines the evidence for the rumours that hospital doctors routinely induce abortions without permission of the woman concerned and dispose of those newly born but unauthorised: all in pursuit of the administration meeting its targets.

Understandably, the policy is immensely unpopular, and the party acknowledges "the contradiction between birth policies and the masses' wishes about having children" (Party Central Committee document 13, May 1986, cited here, p 63) in urging the cadres to move the masses away from the 'old ideology'. A 1988 survey showed that 72 per cent of sampled couples and 90 per cent of rural ones wanted more than one child. Indeed, the economic reform programme has exacerbated the problem: the return, in effect, to the family farm under the household responsibility system has put a premium on increasing the loyal hands available for cultivation which means sons. Increasing incomes of urban and rural families outside the state sector has also given the means to pay stiff fines for non-compliance or bribe party cadres to overlook an unauthorised birth. Other couples move out of the area to escape party supervision to join what the Chinese call 'the floating population' (Aird argues that this could be as large as 50 million), although energetic attempts are made by the party network to track them down and enforce compliance.

The party is severely damaged at a local level. The luckless cadres, as the press reports, are liable to acts of vengeance, destruction of their crops or property. Those that collude are corrupted by bribes to overlook births and falsify the local statistical returns. A 1987 national sample survey revealed, to the horror of the party leaders, that the undercount of births was just under 10 per cent. It is clear by now that the party will not meet its target. A Chinese Academy of Social Sciences report (*Policy Choices of China's Economic Development*) which was just been published accepts that the country's population will not stabilise in the immediate future; it calculates that the country's population will increase from 1.17 billion now to 1.3 billion in the year 2,000, 1.4 billion in 2010 and 1.6 billion in 2050.

Aird presents the evidence, but does not reflect much on why the Chinese government—and many others—has become so committed to such an extraordinary diagnosis, even though he notes that "the coercion issue prompts a re-examination of the 'population crisis' belief, the relationship between population growth and human welfare in general". He recounts the thesis that poverty, hunger, health problems, housing shortages, transport problems, illiteracy, lack of education, unemployment, overcrowding, resources depletion, soil erosion and environmental degradation all are supposed to flow from the single cause of population growth, and all are remedied by ending population growth (the case is equally popular—and no less implausible—when applied to urbanisation and the growth of large cities). As he notes, the sheer simplicity of the thesis, linked to a global humanitarianism, gives it great strength, and it has "the added virtue of putting the blame for socio-economic problems on the reproductive habits of the people rather than defective political leadership or misconceived policies" (p 7)—or, we might add, the gross maldistribution of resources both nationally and internationally.

Yet the population thesis, if taken seriously (as with Indira Gandhi and the Chinese leadership) is one of the crassest and cruellest fantasies to grip the minds of governments, especially because it is usually directed most rigorously at the poorest majority. It is also inherently implausible—as the Chinese population has grown, so the standard of living of the Chinese has made extraordinary advances (reflected in improved infant mortality figures, in the average expectation of life, etc): the growth of population is the most vivid mark of the *success* of the Chinese government rather than its failures. The argument is unbelievably naive—that increasing population divides the national product in smaller and smaller portions; not only is maldistribution far more important (the national product is never divided in equal portions), but a growing population can increase the output faster than its grows (and so far seems to have done so, particularly in China).

Yet on the basis of this inherently implausible thesis, governments are prepared to risk immense unpopularity, shown most clearly in the devastating defeat of Indira Gandhi's Congress in UP in 1977. It seems that, contrary to what one assumes, governments do not necessarily pursue popularity, but rather self-destruction.

There is a broader question. Should governments seek to determine the size, composition or distribution of population? Can they know what an optimum size might look like, whether in terms of national interest or human welfare? And if they can decide on an optimum, do they have the power—or political right—to pursue it? With all the power at their disposal, it is clear the Chinese government is going to fail. Should it even have tried? One of the unexpected implications of the policy is now emerging—the premature aging of the urban population, the contraction of the active age groups, and a rapidly growing problem of meeting a much higher dependency rate. The developed countries may be able to cope with aging, but can a still poor country like China?

The strength of the population thesis also derives, I suspect, from a Puritan ethic, associated with early stages of industrialisation, but of general appeal to authoritarian regimes. The Singapore government also used to have a rigorous family planning programme to limit families (stressing sterilisation as the means to achieve this), although the professional classes were excluded (it was to keep down the rate of growth of the working classes). The feckless, wayward breeding habits of undisciplined women, characteristic of the poor, was to be blamed for the world's problems, and almost inevitably it was women alone who were sterilised. Now the government has come to realise the frightening implications

of aging and the possible drastic decline in the size of the city's population. Policy has shifted no less drastically to urging the better educated to have three or more children. Here, the old eugenics theme is explicit, although the government has not pursued the full logic of the case to the compulsory sterilisation of the insane and deformed—or, in the Nazi version, ethnic minorities (inter-war doctors quite often shared the view that sterilisation was a proper way of improving the quality of the population, so there were quite enough non-Jewish German doctors to supply a 'scientific' rationale to Nazi policy,[3] as others today rationalise coercive birth control).

In China, as in Singapore, it is primarily women who are the target of birth control policy, just as they are the subject of male bullying to break the rules. It is surprising that the feminist movement has not been active in protest on the issue. What should be a matter of liberation—the freedom of women to decide their own reproductive behaviour—has been turned into another appalling oppression.

Yet the underlying issue remains. Why, on such flimsy grounds, do government persist in such unpopular policies? The political function of the doomsday rhetoric serves a clear political function in diverting attention away from the responsibility of government, but this macro observation does not easily translate into the dedicated zealotry of thousands of family planning militants worldwide. Perhaps the means of liberation can only be got to so many women by means of a wrong and reckless diagnosis: is this another wretched irony of history?

Notes

1 As in Mao's 1949 position:
It is a very good thing that China has a big population. Even if China's population multiplies many times, she is fully capable of finding a solution; the solution is production...All pessimistic views are utterly groundless
—'The Bankruptcy of the Idealist Conception of History', September 16, 1949, *Selected Works I*, Foreign Languages Publishing House, Peking, 1961, pp 453-54.

2 Aird cites the case of a Chinese who, while studying in the US, conceived a child. The woman's work unit appealed to her to end her five-month pregnancy as a matter of urgency or 20,000 employees of her factory would be punished (p 75).

Poor Addition to a Rich Literature

Bagaram Tulpule

Working Class Movements in India, 1885-1975 by Sunil Kumar Sen; Oxford University Press, 1994; pp 185, Rs 250.

THERE is no dearth of books, good books at that, on the labour movement in India. Several industry specific and location specific studies are available, besides broad historical studies of the movement as a whole. The dynamics, special features, problems, methodologies, successes and failures of the movement have been examined, analysed and evaluated by several scholars. If someone writes one more book on the subject, one would expect it to offer some new information, viewpoint, analysis or evaluation of the movement or some hitherto unexplored segment or aspect of it. Sunil Kumar Sen's book, unfortunately, does not offer any of these. Sen has, no doubt, scanned a good deal of primary material relating to the movement, including major libraries, National Archives, official reports and documents and so on besides the writings of some other authors. But the presentation of the information gathered from these sources is mainly in the form of isolated events or episodes. They do not generate an integrated picture of, nor throw any new light on, any significant aspect of the Indian labour movement.

An eventful period only a decade short of a century spanning pre- as well as post-independence times and marked by numerous tumultuous and historically decisive episodes is sought to be covered by Sen in a slender volume in which the text proper does not exceed 160 pages. Out of these some 18 pages are devoted to narration of labour events and developments in Jamshedpur alone. It is claimed in the preface that the main focus of the work is "on the part played by the working class in the struggle for independence and socialism" and that the "work is analytical rather than empirical". Actually, however, with the exception of a brief last chapter of some 11 pages, the rest of the book is mainly narrative. Even the last chapter titled 'Aspects of the Working Class Movement' does not offer anything new by way of analysis. And one does not get a clue why, in the title of the book, the author uses the plural 'movements'!

If Sen's purpose is an 'analytical' study, the logic of devoting a whole chapter of as many as 18 pages to Jamshedpur and that too for a period of only 27 years, 1920 to 1947, when the book itself comes up to the year 1975, is difficult to understand. Jamshedpur finds a mention in several other places in the book also. Jamshedpur is, no doubt, a major industrial centre in the country. But in the context of the totality of the labour movement in the country it hardly merits such conspicuous treatment, especially since developments there have usually remained somewhat isolated from the rest of the movement.

For the post-independence period copious documentary material exists in the form of reports, resolutions and statements of the different central trade union organisations, industrial federations like those of railwaymen, defence employees, P and T employees, bank and insurance workers, and so on. The proceedings of the different tripartite bodies, the issues coming up there and the positions taken by trade unions on them, memoranda submitted by trade union bodies to the National Commission on Labour also provide valuable source material for study. The report of the National Commission on Labour is a storehouse of information in itself. For someone undertaking a study of the Indian labour movement, its dynamics, concerns, strategies, internal tensions and conflicts and so on, these sources would be invaluable. Sen, however, does not seem to have even looked at any of these. Naturally, his treatment of the post-independence period has become a more or less bland enumeration of a host of disputes and conflicts in different parts of the country interspersed with some stray generalised remarks here and there.

Accuracy and clarity are not conspicuous features of Sen's narrative. Loose, incorrect, trite or obscure statements abound. Table 1.1 on page 2 bears no caption but purports, judging by the text, to present figures of numbers of workers employed in different industries in the manufacturing sector in the years 1911, 1921, 1931 and 1951. Why the figures are not brought up to 1971 when the book purports to cover the period up to 1975, and the figures are readily available, is not clear. Further, the table does not indicate whether the figures are in tens, hundreds or thousands. The figures given against cotton textiles, for instance, for the four years are 3,340, 2,930, 3,169

[illegible] respectively. Obviously, these figures cannot be in hundreds nor in thousands. Then how are they to be understood? And in any case, employment in the cotton textile industry given in other official sources will not tally with these figures, howsoever they are reckoned. Similarly, the same table shows total employment in the manufacturing sector as 11,707 in 1911, 10,652 in 1921, 10,433 in 1931 and 12,674 in 1951. Apart from whether these figures are in hundreds or thousands and whether they are at all correct—officially published figures are altogether different—Sen's figures would mean that there was virtual stagnation in total manufacturing employment between 1911 and 1951.

Similarly, Table 1.6 on page 15 gives what purport to be rates of fatal accidents in industries during different periods. These, the table says, were 5.0 during 1919-23, 9.2 during 1924-28, 13.4 during 1929-33 and 13.6 during 1934-38 *per hundred*. Again, these figures are absurd. With these kind of fatal accident rates, factories could never have been allowed to work. Actually, officially published statistics show that frequency rates of fatal accidents in factories are of the order of 0.1 to 0.2 *per thousand* per year

In presenting industrial disputes statistics, it is customary to give yearwise figures of number of disputes and number of worker-days lost due to them. In the present book, however, some of the tables give the number of workers involved but not of worker-days lost.

Sen lists 'Indian working class being organised in trade unions' as one of the factors which contributed to the introduction of factory legislation (p 17). Actually, the first factory law was enacted decades before the establishment of the first trade unions in the country.

On page 4, we are told that around 1921 and 1931, "Ratnagiri, Satara, Poona and Kolaba ceased to be the main sources of labour supply" to the textile mills in Bombay. Actually, even today, textile labour in Bombay comes largely from these districts and has done so all along.

About the 1919 textile workers' strike in Bombay, Sen states that workers refused to surrender although "...the Kamgar Sabha advised them to resume work". But there is no mention of any organisation named Kamgar Sabha in the narration and most other records of the strike do not mention any regular organisation of the striking workers at all. On page 41, N M Joshi is described as a 'social teacher' whatever that may mean and on page 43, we are told that Shibnath Banerjee "...went to Moscow and emerged as a labour leader".

A section beginning on page 52 bears the caption 'The Great Depression and Splits in AITUC' giving the impression that the two were somehow interrelated. The text, however, does not even hint at any such interrelation. Elsewhere, Sen has again juxtaposed two unrelated developments as if they were cause and effect: "...With the revival of the Indian economy the government passed the Payment of Wages Act 1937" (p 57). The same trade union body is mentioned as 'Federation of Indian Labour' and 'Indian Federation of Labour' on the same page (68). On page 71, we are abruptly informed that "apparently, the Mazdoor Sabha grew in strength" although the previous several pages make no mention of any Mazdoor Sabha, its location, industry nor is the statement supported by any facts or figures. On pages 82-83, we find the following statement: "the Hindu Mahasabha as well as the Muslim League had been holding meetings and demonstrations propagating partition". Further, on page 83 it is said, "communal riots spread to Bihar after the Noakhali riots in which at least 7,000 persons, mostly Muslims were killed". Are we to understand that Hindu Mahasabha propagated partition and that those killed in Noakhali were 'mostly Muslims'?

A 'Commerce Minister' is mentioned for the year 1924 when at that time there were no 'ministers' of any kind in the Indian government (p 91). In the context of a strike in Jamshedpur in 1928, N M Joshi is referred to as "... the veteran trade union leader..." when he was still to reach 50 and was to live 27 more years (p 98). On page 109, a part of a sentence reads "...the Communist Party which virtually guided the activities of the AITUC from 1948 to 1952...". It is well known that the CPI not just guided but fully controlled the AITUC during the entire post-independence period and even a few years before. Elsewhere, it is mentioned that Kedar Das "... had been elected as secretary to the Bihar Assembly..." Kedar Das, as the text informs us earlier, was elected to the Bihar Vidhan Sabha from Jamshedpur on CPI ticket. How he could be 'elected' as 'secretary of the Bihar Assembly' is a mystery (p 118).

One must resist the temptation to go on adding to these instances. They betray a lack of due care in writing and editing which only aggravates the general poverty of the material presented.

In his total view of the labour movement in the country, Sen regards the role of communists as the most important and decisive both during the pre- and post-independence periods. This is not supported by the known facts about the movement nor do many independent scholars agree with it. Sen does not argue the point seriously and try to refute the view held by other scholars. The fact is that after their co-option by the colonial government during the second world war and especially their opposition to the Quit India movement, communists were clearly thrown on the defensive in the labour movement and their role in the movement has generally diminished over time. The 1949 crack-down on the CPI by the Indian government which was really provoked by the political line adopted by the party in favour of a violent uprising against the established government on the Telengana model is referred to by Sen as "...deadlock in the labour movement..." (p 113). Whatever the merits of the anti-communist crack-down, it affected only the communist-led trade unions which were a small minority in the country. The rest of the movement continued to be vibrant and there was no 'deadlock' in the movement in any sense of the term.

In sum, one wonders how a book with such modest substance written with so little care, hardly edited, got to be published by so reputed a publishing house as the OUP.

Taming Speculators and Putting the World on Course to Prosperity

A 'Modest Proposal'

G C Harcourt

A number of important markets have today come to be dominated by speculative forces: for example, the market for foreign exchange and the stock market. The housing market, too, has tended to be dominated by people who are speculators rather than genuine purchasers of long-term housing services.

But rather than attempting to reintroduce controls, for example on international capital flows, which both the ideological climate and recent technological advances make unrealistic, there is a lot to be said for getting agreements on some 'Pigovian' carrot and stick measures: that is to say, while not directly stopping anyone from doing anything, yet indirectly giving them incentives radically to change their behaviour.

FOLLOWING my Donald Horne Address and its sequel on macro-economic policy for Australia in the 1990s [Harcourt 1992, 1993a], I wrote a jokey paper with a serious intent for the undergraduate Marshall Society journal at Cambridge, my plan to 'save' the world [Harcourt 1993b]. In the present paper I go over some of the arguments in these three papers, and expand them into a discussion of possible policies for the United Kingdom and Europe in particular, though I continue to argue for the need to take a world perspective and to call for international institutions and co-operation.

Initially, I divided the world and its problems into three broad groups.

(1) the developed industrial nations;

(2) the former, so-called socialist countries of eastern Europe and what was USSR;

(3) the developing countries.

I said I realised that this was far too crude a classification but that it would do for the purposes I then had in mind. Now I want to add a fourth and fifth group:

(4) the rapidly growing NICs on the Pacific Rim—Singapore, Malaysia, Taiwan, South Korea, Thailand, Hong Kong and Indonesia (to a lesser extent);

(5) China, which *is* following a middle way, freeing up some markets and industries to capitalist influences and creating some capitalist institutions, i e, stock exchanges, while attempting to maintain a tight authoritarian grip on social and political life.

As a broad generalisation and relative to the first three groups, the internal problems of groups 4 and 5 are under control and their impact on the first three groups is broadly that of an expansionary injection. So I shall continue to concentrate on the first three for they have, again relatively, the most pressing problems.

The principal economic problem of the first group is sustained mass unemployment with which is associated the need for many of them to restructure in order to solve persistent balance of payments problems; of the second, the need to get through transitions to more market-orientated economies without complete social, political and economic disintegration; of the third, the need to provide necessary infrastructure for development, capital goods for their industries, and to find outlets for their exports at steady prices in order to create jobs and raise living standards.

Before setting out what should be done, let me briefly remind readers of the 'vision' of the nature of economic processes that forms the backdrop to the policy proposals that follow. As I argued in Harcourt (1992), there are two alternative 'visions' in economics: one likens markets, or even whole economic systems, to a wolf pack running along smoothly. If, per chance, one or more wolves get ahead or fall behind, forces immediately come into play which quickly return them to the pack. In the other 'vision', the forces which come into play when the breakaways get ahead or fall behind are much more likely to allow them to get even further ahead (or fall further and further behind), at least for long stretches of time. The latter 'vision' underlies the following analysis.

Let me also recapitulate what I wrote in Harcourt (1992) about the nature of markets, their workings and the conditions necessary for them to be beneficial rather than socially harmful.

Modern theory has laid down very stringent conditions which have to be satisfied before it can be claimed, even in theory, that the market outcome is socially desirable. (I repeat that it is a *non sequitur* to go from establishing that there may be, in the fashionable jargon, market failures, immediately to claiming that therefore government intervention will make things better.) The first is that actual prices of products should be a true measure both of the social costs of the resources used to create them and of the satisfaction which their use is expected to bring to their purchasers. That is why price-takers are needed. Producers can then match their costs to externally given standards which simultaneously signal to purchasers the terms on which they can expect to achieve satisfaction. This requires that prices, most of the time, should be such that what is voluntarily demanded is equal to what is voluntarily supplied. This in turn requires that flows of purchases and flows of supplies in markets should dominate the setting of prices. Inventories or stocks, though important for smooth production and sales, nevertheless need to play a subsidiary role in the determination of actual prices. Moreover, if current prices are not achieving this match, they must directly or indirectly give out signals which encourage measures to be taken which will quickly achieve such a match, often a very tall order indeed in many important markets. It also has to be supposed that prices act solely as rationing devices. That is to say, nothing else may be deduced from the price of a good or service about its qualities other than its relative scarcity or abundance. Modern work suggests—perhaps I should have written, has rediscovered—that the demand and supply of labour services, and of credit, do not set up prices with this required characteristic.

If demands are dominated, not by expected satisfaction but by guesses about what prices may be in the future, so that a large element of speculation is present in the formation of prices; and if supplies are offered, not in response to perceived costs but in anticipation of future movements of prices, or of other people's expected anticipations of such movements; then the ensuing prices which are set may bear no systematic or reliable relationship to the real economic factors of

the regular economic activity which, it is argued, prices ought to reflect. And all this is independent of whether power is diffused equally on both sides of the market, or whether it is concentrated in the hands of either buyers, or sellers, or both.

Let me now add a little more on speculation and its effects. The traditional case for speculation was that it reduced the amplitude of fluctuations in prices and helped markets to reach their equilibrium levels more quickly than otherwise would have been the case. But if, as we mentioned, markets behave like the second wolf pack analogy, we have to deal with cumulative movements, either virtuous or vile, rather than supposing there to be an equilibrium 'out there' to be found. We have already mentioned that a number of important markets are dominated by speculative forces: for example, the market for foreign exchange and the stock market, in both of which recent technical progress has reduced the short *period* to a length of historical time which is probably even shorter than the corresponding length of Marshall's market *day*. The housing market, too, has tended to be dominated by people who are speculators rather than genuine purchasers of long-term housing services; or, at least, the two often conflicting purposes may be combined in the one purchaser, egged on by estate agents and the suppliers of finance.

Now all these phenomena are spread, if not world-wide, at least over most of the developed world, so we need to think about international agreements with which to tackle their effects. Rather than attempting to reintroduce controls, for example, on international capital flows, which both the ideological climate and recent technological advances make unrealistic, there is a lot to be said for getting agreements on some 'Pigovian' carrot and stick measures: that is to say, while not directly stopping anyone from doing anything, yet indirectly giving them incentives radically to change their behaviour.

Let us take the foreign exchange markets as an example. If we want exchange rates to reflect real economic forces—trading prospects, real investment opportunities—we need greatly to reduce speculation, and so its effects on the determination of exchange rates in both the short and longer terms. For neither in the short term nor on average over longer periods do exchange rates at the moment reflect these economic activities. This is especially so, if we accept that there is no underlying set of long-term equilibrium exchange rates, reflecting a long-term equilibrium of an interrelated system, but, rather, changing structures which reflect the appreciation and depreciation of individual rates because of the underlying differences in the growth rates of productivity and national products. As I shall argue later, these processes should be tackled by having a fixed exchange rate system with which is associated agreed rules for periodic changes if other measures for attaining internal and external balance in individual countries are not working.

A simple way of tackling speculation and its effects is through the taxation systems of the various countries. The taxation authorities would require that the turnovers of the foreign exchange dealers who pay tax in their countries be classified into three broad categories: foreign exchange bought and sold for purposes of trade (and consumption, e g, tourism[1]), and for long-term investment either in securities or directly. (Insofar as the traders were concerned with the sale or purchase of commodities, spot or future, a case would have to be made by the taxpayers that these were to help production, or that they were legitimate sales, rather than for speculation.) This would leave a residual third category which would be mainly accounted for by speculative activities. Then the proportions of each category in total turnovers would be used to assess the total taxation paid on the profits of the dealers. There would be a much higher rate for the third category than for the first two, so that the larger was the amount of speculation which was financed by foreign exchange purchases or sales, the greater would be the taxation on the profits of the dealers.

Similarly, the purchasers or sellers for whom the dealers were acting would have their business or private incomes taxed at different rates according to the categories into which their transactions fitted. For companies, a higher rate of taxation would be levied in relation to their speculative purchases or sales. For individuals, a surtax on their income tax would be levied, according to how great their speculative activities had been.

Exactly the same sorts of schemes could be used to curb speculation on the stock exchange and in the housing market. The taxation authorities would tax dividends at lower and lower rates, the longer shares were held. The rates of capital gains tax similarly would be lower, the greater was the length of time between purchase and sale. The taxes placed on stock brokers would vary according to the proportions in their turnovers which were accounted for by quick sales and purchases of the same shares—the other side of the coin of the measures outlined above. For the housing market, purchase taxes would be varied according to how many times the taxpayer had bought and sold a house. Exemptions from higher rates would be granted if it could be shown that the sales and purchases were for legitimate economic and social reasons—labour mobility, i e, persons changing jobs and localities, a larger house for an expanding family, or for elderly 'reles' to come to live/die in; and so on. Similarly, the transactions of real estate agents or solicitors would be monitored and they would pay higher taxes according to the proportions of *their* turnovers which were associated with speculative transactions, as opposed to the economically and socially acceptable ones identified above.

All these schemes need to be implemented in individual countries to stop nationals going 'off shore' and so escaping taxes.

Let me conclude by setting out briefly some broad measures with which to tackle the problems we identified for the first three groups.

For the first group, we need a set of co-ordinated measures, both fiscal and monetary, macro and micro, which together will bring about gentle but sustained expansion. These should emanate from the EC countries in co-operation with the US and Japan, and to a lesser extent perhaps, the Antipodes. Included in the set of measures would not only be the more short-term measures of lower rates of interest, investment subsidies,[2] possibly tax cuts (much more debatable for those countries with restructuring problems), but also longer-term institutional changes as well. For example, as I argued in Harcourt (1992), it would be most desirable for central banks to encourage trading banks to take medium- to long-term views on the viability of their customers' business and/or projects and if these are favourable, to back up the banks in seeing through any short-term problems of their customers.

At the same time, the advanced countries should give a lead in creating institutions which have aims which are similar to those of Bretton Woods, especially the set of proposals that Keynes argued for. Especially do we need measures which make both deficit *and* surplus countries react in such a way to their situations as to allow employment to be sustained and growth to continue, individually and collectively. That is to say, we need to have re-established a regime of reasonably stable exchange rates, but with the well understood and accepted proviso that co-ordinated changes may need to occur from time to time, that nothing needs to be carved in stone for ever (except the well known relationships between marginals and averages). If the taxation measures in regard to speculation were instituted internationally, establishing 'Bretton Woods in spirit' would be more feasible.[3]

The second group—the former so-called socialist countries—eventually will hope to make all manner of goods and services that will be able to compete successfully in the markets of the developed and developing countries. At the moment, though, they have idle people and idle capacity even in the activities they are able to handle, mostly in the heavy industries which are a legacy of their 'Stalinist' pasts. Many parts of the developing world, by contrast, lack basic

capital goods for both needed infrastructure and industry and agriculture, as well as the wherewithal with which to pay for them. The World Bank needs to be revamped, and its activities vastly extended, so that it can be one of the main channels whereby purchasing power is provided for these countries to buy this equipment, principally, in the first instance anyway, from the former socialist countries that have the persons and the capacity to provide it. This will help to give the latter economies the required breathing space to develop their needed, longer term, restructuring.

The role of economists at the World Bank (whose comparative advantage is surely in micro-economics) should be to vet individual schemes put forward by governments and industries in the developing countries. A prerequisite for these processes to be able to start up through World Bank grants is first to wipe out, preferably completely, the current huge indebtedness of many developing countries which is now a dead-weight drag on their activities. Such a cancelling of debt will require co-ordination between the advanced and developing countries in order to make sure that the banking systems of the former are not destabilised—again a role for co-ordinated central bank actions in these countries.

If the first group countries are successful in getting their act together, the sustained expansion in their production and incomes will spill over into world markets so as to put a floor under the prices of, and increase the demand for, the export products of the developing countries. This, in turn, will do much to help them to help themselves with their own development. However, it will also be necessary to guard against overshooting—prices spiralling upwards, for example—so we need to turn attention again to some form of buffer stock scheme, perhaps like those proposed by Keynes and, in the post-war years, by Richard Kahn [see, for example, Palma 1994]

Finally, to guard against the re-emergence of inflationary pressures in the developed world, alongside the proposed co-ordination of fiscal and monetary policies and micro-economic reforms, should be developed incomes policies which are allied with trade-offs through their public sectors. These should be package deals which are suited to the institutions, history and sociological characteristics of the countries concerned. Hopefully, these may reverse the trend towards the euphemistically named flexible labour markets, which, quite apart from the social harm they cause, are also economically inefficient. As I argued in Harcourt (1993a: 172-73), money-wage movements which broadly reflect changes in effective productivity *plus* the general price level are beneficial to overall growth as Wilfred Salter (1960, 1966) argued many years ago. For such a policy favours technologically advanced, growing industries and discourages those whose time has not only come but has gone.

I hope it may be seen that all this hangs together and that it is underlaid implicitly by theoretical structures which emanate from Keynes, Kalecki, Kaldor, Myrdal and Joan Robinson.[4] Were it to come to pass, the economies of the world could enter a virtuous upward spiral of sustained expansion and development.

Notes

[While many of the specific policy prospects discussed here have been suggested by others, e g, Ruth Kelly, James Tobin, perhaps I may claim some novelty for the entire package deal of interrelated measures which follows. I thank *without implication* Philip Arestis, Ha-Joon Chang, Ruth Kelly, Peter Nolan, Nevile Norman, Ajit Singh, Beth Webster, the participants of the Queen's Seminar, Lent Term 1994 and of the Post-Keynesian graduate students' workshop in the Lent Term 1994 for their interest and comments.]

1 Ha-Joon Chang reminds me that if this is not to become a loophole some upper limit on purchases will be needed.

2 On the side of real investment governments should take the lead in designing investment incentives which persuade business people to invest in those areas which, overall, governments have decided most need to be developed. Provided these areas are defined broadly enough, the chances of corruption would be lessened, yet neither governments nor their civil servants would be able to dodge the responsibility for giving leadership in what should be partnerships between public and private sectors.

3 Paul Davidson has developed some imaginative scenarios which give detailed content to the policies outlined above: see, for example, '*The General Theory* in an Open Economy Context', a chapter in the book on a 'second edition' of *The General Theory* which Peter Riach and I are editing for Routledge.

4 Though urged to do so by Nevile Norman, I have deliberately not gone into much detail on any one proposal. I thought it better to set out an overview which could be easily absorbed and so let others, if persuaded, provide detailed recommendations for each part. For the same reason, I have also not included orders of magnitude of, for example, the huge rise in the turnover of business on the foreign exchanges in recent decades which reflects the increasing dominance of speculative movements.

Fate of the Forest: Conservation and Tribal Rights

Amita Baviskar

The recent circulation of a draft Forest Act has once again brought into question the future of India's forests. The draft Act proposes to take a strongly conservationist stand against environmental degradation by severely restricting people's rights to the forest. How environmentally successful and socially just will such a policy be?

This essay examines the experience of adivasis in Jhabua, Madhya Pradesh, whose livelihood derives from their use of the forest, and who are held responsible by the state for destroying the forest. The state's persistent efforts to deny adivasi rights to the forest has resulted in an ongoing conflict that today constitutes the biggest obstacle to forest conservation.

The author analyses the relationships between adivasis, the state and the forest to argue that the future of India's forests is inseparable from the future of India's adivasis. Forest conservation is possible only if people's rights are recognised and established within a larger programme of tribal development.

I
Introduction

Sondwa (District Jhabua) May 28, 1994:

MORE than a thousand Bhil and Bhilala divasis crowded the block headquarters in his small town to submit claims for the egularisation of their encroachments on orest land, locally known as 'nevad'. May 1 is the last date for submitting claims. The ımout, several times larger than that for any lection, took the administration completely y surprise. The sub-tehsil office ran out of eceipt books and had to extend its working the next day, a Sunday.

The prospect of regularisation has driven divasis in droves to the tehsil headquarters t Alirajpur where almost everyone capable f filling up a form is being besieged with equests to oblige. The owner of the local hotocopying shop has made a killing with is package deal of xeroxing the forms (which re in short supply) and filling them up for is customers. For the almost wholly illiterate divasis, such a service is worth even a undred rupees. The biggest bucks, however, ave been made by the village patvaris who eep revenue records and the forest nakedars. 'heir privileged access to government ecords has made them highly sought after s fillers-up of 'nevad' forms. The fast-pproaching deadline for submitting forms as brought money pouring into their hands.)ne patvari demanded a sum of Rs 8,000 rom the people of one village for merely orwarding their claims to the tehsil office; nd, but for the intervention of a local adivasi ade union which opposed such extortionist emands, the patvari would have got it too. 'he adivasis do not know that they are ntitled to free forms. There is supposed to e no fee at any stage of the process of ubmission of claims.

The adivasis who came to Sondwa have *'e facto* control over the land that they ultivate. For decades they have laboured nd tended their 'nevad' fields; they have worshipped this land and raised their children on its bounty. But such is the power of the state over people's minds that they crave the legitimacy accorded by the government. One scrap of paper, in the usually illegible scrawl of the tehsildar, seems to be more real and true than the land and the soil itself. The state's sanction seems more authentic than adivasis' bonds with their earth. This irony is not incidental: it is the cumulative product of years of state intervention in the adivasi relationship with the forest.

The rush to submit claims is a consequence of a Madhya Pradesh government move to implement a central government directive to regularise 'nevad' (encroachments on forest land) which promises to give adivasis title to land that they have cultivated for decades. However, very few adivasis may actually meet the stringent conditions laid down in the ministry of environment and forests order. In order to qualify, adivasis must prove that their 'nevad' encroachment happened before October 1980, that the 'nevad' field does not have a gradient exceeding 30°, and that their legal landholdings do not exceed 2 hectares (ha). The fortunate few who satisfactorily meet these conditions will be entitled to patta (title) for 'nevad' such that their total landholdings reach the 2 ha ceiling. Very few of the adivasis who flocked to Sondwa or Alirajpur will ultimately get the patta that they desire so desperately.

The mass submission of claims also highlighted the utterly shocking state of land records in Alirajpur. The peasant's basic document of proof of landownership is a small booklet that lists the names of the owners, and the size and location of their plots of land. Many adivasis who came to Sondwa carried booklets that had belonged to their grandfathers, that had since acquired the patina and dog-eared look of venerable old age. While their antiquity rendered them mildly interesting as historical objects, they were useless in performing their primary function, viz, recording present-day landownership. Numerous land transfers spread over two generations due to death, inheritance and partitioning, had happened without making their way onto the pages of the booklet. Since getting the booklet updated entails several trips to the tehsil office as well as bribes for the patvari, people usually give up after a while, and make do with obsolete records.

If records of legal holdings bear little relation to actual landownership, records of 'nevad' encroachments are much worse. The only official proofs of 'nevad' are the receipts that adivasis are supposed to get after paying fines for the offence of cultivating forest land. Most people, however, were never given receipts because the fines that they paid went directly into the pockets of the forest guards, nakedars and deputy rangers. When receipts were given in exceptional cases, very often they were small bits of paper that were easily lost or destroyed.

The absence or the poor quality of official records makes it very hard to precisely estimate the extent of 'nevad'. There are no detailed published statistics on the subject, even though the partial data that does exist indicates that 'nevad' forms a significant part of total forest land. An authoritative source estimated that out of Madhya Pradesh's total 15.5 million ha of forest land, 1.6 million ha (more than 10 per cent) was 'lost to encroachment' between 1956 and 1989 [Buch 1991: 12]. In Jhabua district, prolonged agitation by the adivasis of Sondwa block, led by Khedut Mazdoor Chetna Sangath (KMCS), a local trade union, forced the forest department to conduct a survey of 'nevad' in the forests of Mathvad in 1988. The survey recorded that almost every cultivator in the area had supplemented his legal holdings with several small plots of 'nevad'. In one village alone, 14 cases of encroachment amounting to 192 ha of forest land were recorded. Most of these fields have been cultivated since 1970 and even earlier.

The prevalence of 'nevad', and its centrality in the lives of thousands of adivasis

is also reflected in the quantum of litigation regarding forest offences. At least one case of violation of forest restrictions has been registered against almost every cultivator in Sondwa block. While some of these cases pertain to illicit felling of wood or other minor offences, the bulk are related to encroachment.

'Nevad' is a forest crime. According to the forest department, the adivasi practice of clearing forests and converting them into farm land is one of the main reasons for the destruction of the forest. Why then has the government moved to regularise some of these encroachments? Some people allege that this is a populist ploy or 'misguided philanthropy' on the part of the government [Buch 1991:61, 85], intended to please a tribal-dominated electorate. Such regularisation, it is predicted, will prove environmentally deadly in the long run for, once the flood gates are opened, there will be no stopping the deluge of 'nevad' claims. However, from the point of view of adivasis who have for decades been agitating for rights to the forest, regularisation is simply the forest department's surrender of territory that had never morally belonged to it. In this view, regularisation of 'nevad' is a belated first step towards a fuller recognition of adivasis' rights to the forest. Any genuine programme of forest conservation must begin by accepting adivasi rights of ownership and control as its basic premises. This latter argument, however compelling from the point of view of social justice, leaves unresolved the vexing issue of environmental damage. 'Nevad' *does* destroy forests. Where then does the solution lie?

II
Conservation and Draft Forest Act

The episode in Sondwa encapsulates the complexity of the 'nevad' issue. In the official view of the forest department, 'nevad' is part of a package of practices by which adivasis, especially Bhils and Bhilalas, destroy the forest. The degradation of the forest is attributed to 'biotic interference', a term used to describe the assaults made on the forest by local communities seeking fuel, fodder, other forest produce and, in the case of 'nevad', cultivable forest land. The livestock population of Madhya Pradesh increased from 30.6 million in 1951 to 42.5 million in 1981. The pressure of ever larger herds of cattle and goats foraging in the forests has not only destroyed existing vegetation, but has also prevented its regeneration. With the population of Madhya Pradesh swelling by 10 million over the 10-year period from 1971 to 1981, increased demand for fuelwood has led to such intensive lopping that trees have become stunted shrubs. And, finally, the conversion of forest land into cultivation through 'nevad' encroachments is the most unkindest cut of all. No wonder then that an authority on Madhya Pradesh's forests remarked that, "the only symbiosis in the relationship of the Bhils with the forests seems to be that between a meat cleaver and the goat that it is about to decapitate" [Buch 1991: 84].

In order to save forests from further degradation, the ministry of environment and forests has proposed a draft bill called 'The Conservation of Forests and Natural Ecosystems Act' which seeks to meet its objectives by severely restricting local communities' rights to the forest. The act proposes strict state control for 'sound ecological management'. Sections 5 and 34 prohibit state governments from granting pattas or occupancy rights to unauthorised encroachers on forest land, without the permission of the centre. Sections 3(2) and 27A vest the centre with the power to direct any state government to constitute reserved forests in any specific area. According to Ramachandra Guha, the draft Act will sharply curtail people's rights by classifying most forests, especially the better quality ones, as Reserved Forests, to be owned and managed by the state. Sections 1.12 and 13(d) state that the exercise of rights in reserved forests, such as the collection of fuel, fodder, etc, can be continued "subject to the carrying capacity of the land in question and prevention of its overuse". If the land is "already degraded", the Forest Settlement Officer can immediately stop the exercise of rights until he is satisfied that the land has been "restored to its potential productive capacity". Sections 16 and 22A provide that all rights can be commuted, i e, extinguished with a one-time payment, if the government considers this to be necessary for the prevention of "degradation of the said reserved forest". Likewise, Section 76A reserves to the central government the right to make any rules for "rationalising rights, privileges and concessions in respect of forest produce from reserved and protected forests". As Guha remarks, "rationalising" is, of course, only a euphemism for "extinguishing" [Guha 1994].

While closing off people's rights in Reserved Forests, the Act offers them a limited opening in the form of village forests which will be managed to meet the biomass needs of local communities. On closer examination, even this crumb of comfort turns out to be cold. Since the Act states that village forests cannot be constituted from Reserved Forests, and as Reserved Forests predominate in most states, very little area will actually be available for the formation of village forests. And, even in village forests, the state will retain its dominant role. Section 34AA 1(c) vests the power of determining villagers' rights with the state government. Section 34AA 1(j) empowers the state government to take over the management of a village forest if it decides that the local body is unable to protect the forest. Anyone who is deemed to benefit from a village forest, stands to lose rights to pasturage and forest produce in reserve forests (Section 15(3)iii). The Act also arms the state with extensive punitive powers against offenders. Section 64(1) empowers any forest officer, police officer or revenue officer to arrest and detain in custody, without orders from a magistrate and without a warrant, anybody suspected of committing an offence, abetting an offender or obstructing the execution of an officer's duty. Thus, the Act, in its entirety, amounts to a systematic attempt to legislate people out of the forest.

There is widespread consensus that the problem that the draft Forest Act seeks to address is a genuine and pressing one. 22.4 per cent of India's land mass is designated as 'forest'. However, it is widely acknowledged that only 42 per cent of the area thus designated is actually under adequate tree or grass cover; the rest is more or less completely devoid of vegetation [Vohra 1980:3]. With satellite imaging, the government has been compelled to be more accurate in its estimates of deforestation. According to the National Remote Sensing Agency, forests covered 55.5 million ha (16.89 per cent of total land area) in 1972-75. During 1980-82, this area dropped to 46 million ha (14.1 per cent of total area). In the 1990s forests cover a scant 32.8 million ha or 10 per cent of total land area. Whereas four million hectares of forest area was 'lost' between 1951 and 1976, over the last 15 years, 22.7 million hectares of forest has been cut down [Gadgil and Guha 1992:196; UNDP 1992:173]. The rapidity with which we are losing our forests certainly demands immediate attention and action.

But while there is no disputing the fact of the crisis or the need for urgent action, there is considerable controversy about the way in which the government proposes to deal with the problem. Is state-controlled conservation, as envisaged in the draft Act, possible? Will extinguishing the rights of local communities prevent the degradation of forests? What is the optimal—socially just and environmentally sustainable—solution to what is apparently a trade-off between conservation and villagers' demands? In order to approach these issues with any degree of insight, we must examine the relationships between the state, adivasis and the forest. An appreciation of these relationships is essential for designing a conservation-oriented forest management strategy that actually works on the basis of popular support. This essay attempts to conduct such an analysis for a part of Alirajpur tehsil in Jhabua district, Madhya Pradesh, mentioned earlier as the place where the 'nevad' rush occurred. This area is particularly appropriate as an illustration of

the arguments contained in this paper for it has witnessed a sustained struggle by adivasis for their rights to the forest. This area is also the site of a small experiment in community forest management which offers an alternative model for forest conservation. The Alirajpur experience is relevant and significant not only for tribal areas in Madhya Pradesh, but elsewhere in India as well.

In this essay, I shall begin by describing the economy of the Bhil and Bhilala adivasis of Alirajpur, focusing particularly on their dependence on the forest. Then I shall delineate the periodic crises that have erupted whenever the state has attempted to close off access to the forest. Following this, we shall examine the state's analysis of the 'nevad' problem and official responses to these conflicts. The subsequent section will look at the state's own experience of forest management in Alirajpur, both historically and through present practices, especially in terms of their impact on adivasis. I will argue that the forest department's record with respect to environmental conservation contradicts its claims for pre-emptive rights to the forest at the expense of adivasis. In the concluding section, I shall examine some attempts made by a trade union in Alirajpur to initiate an alternate model of conservation based on local management of forest resources. This suggests that the goal of environmental conservation on forest lands can only be achieved by vesting ownership and control with local communities.

III
Alirajpur: Development Profile

Alirajpur tehsil in Jhabua district lies at approximately 22°N latitude and 74°E longitude in the south-west corner of Madhya Pradesh in western India. Here the river Narmada flows into a rocky valley flanked by two hill ranges—the Vindhyas on its north bank and the Satpuras on the south, becoming the border between two states, Madhya Pradesh on the north bank and Maharashtra on the south. Being the western-most tip of the Vindhyas, Alirajpur is mountainous; the hills are covered by dry deciduous mixed teak forests, which have been partly cleared for cultivation. The rocky terrain, broken by gorges and streams, has thin soils. The slopes are watered only by the monsoons and rain tends to vary wildly from year to year. While rainfall averages around 60 cm. in the last seven years it has fluctuated between 41 cm and 96 cm. Consequently, drought is a frequent visitor to this land. Alirajpur tehsil has an area of 2,237 square kilometres. The region is sparsely settled compared to the national average, with a density of only 87 people per square km.

Forty-five years after independence, Alirajpur presents a dismal picture in terms of various human development indicators: a scant 4.6 per cent of the population is literate; only 2 per cent of the women can read and write. Of the tehsil's total population of 1,96,000, only 14 per cent has access to government medical services. A mere 55 (16 per cent) of the 339 villages in the tehsil are electrified. Most villages have no source of safe drinking water. A part of the Bhil belt which stretches from western Rajasthan through Gujarat and Madhya Pradesh to Maharashtra, the population of Alirajpur is overwhelmingly tribal; almost 89 per cent of the people belong to the Bhil and Bhilala tribes. Another 6.7 per cent belong to various scheduled castes. The small non-adivasi population includes Bohra Muslims and Banias, who tend to be traders and moneylenders, and Rajputs. Just as commerce is dominated by non-adivasis, so is the state administration; generally, adivasis are employed only in a few petty posts. There is a sharp social divide between adivasis and non-adivasis (locally called 'bazaarias' or people of the town, by the adivasis), with the latter regarding the former as savage, backward, and contemptible.

Jhabua district is counted among the poorest districts of India, and most of the population of Alirajpur falls well below the poverty line. Almost all the people of Alirajpur make their living from the land. Eighty-three per cent of adult workers cultivate their own land, and another 8 per cent work as agricultural labourers. People mainly grow maize, jowar (sorghum) and bajra (pearl millet) and several kinds of pulses. While the cereals are intended for self-consumption, some part of the pulses may be sold. Oilseeds such as groundnut and sesame are primarily grown for sale. Small quantities of coarse cereals such as 'badi' (*Setaria italica Beauv.* or fox-tail millet) and 'batti' (*Echinicloa colona*), fibre crops like sunn hemp and 'bhend' (*Urena lobata*), and several kinds of fruits and vegetables are also grown for own use. Although people grow as many as 20 different crops, agricultural productivity is low due to skeletal soils and unpredictable rains. Only 8 per cent of the total cultivated area of Jhabua district is irrigated. Out of the district's total of 97,674 agricultural holdings, 91,507 holdings (93.6 per cent) are classified by the government as uneconomic.

Since their legal landholdings are marginal, people rely as much on livestock and the forest to sustain themselves. Access to the forest enables adivasis to own large herds of livestock that would be impossible to maintain otherwise. Besides keeping draught animals to work the land, most households have at least one cow and several goats. The better-off adivasis keep buffaloes and large herds of goats. Goats are the preferred form of livestock in Alirajpur, just as they are preferred by poor people everywhere for their ability to thrive on low-quality fodder and for the comparatively small investment that their purchase entails [Jodha 1994: 165]. While there is little significant differentiation in the size of legal landholdings among adivasis, the size of livestock herds tends to vary quite a bit. Thus relative wealth is dependent on the number of cattle, goats and hens that a family owns. Villages where nearby forests provide plentiful fodder take in livestock from less well endowed villages for part of the year, in exchange for some cash or agricultural produce and the right to the manure.

Dependence on Forest

As important as legal land and livestock is the forest. Although the forests of Alirajpur have been written off by the experts as highly degraded, and indeed, crown density is 40 per cent or less, they still manage to sustain the tribal economy in a surprising variety of ways. In one village alone, people easily identified 150 different tree species and described their different uses. Through the seasons of the year, the cycle of collecting various forest produce marches along with the cycle of agriculture [Baviskar 1994]. Adivasi homes, constructed entirely of teak, bamboo and 'anjan', with floors of packed mud and cowdung, are in a way simply the forest transformed.

The forest is the source of much more than house-building material; fodder, fuel, fibre, fruit, medicines and edible gums figure among items too numerous to list here. To name only five of the most important species: bamboo is woven into baskets, some of them four feet high and equally wide to store grain; arrows and bows are made from bamboo as are fishing traps and brooms and axe handles; strips of bamboo line the roof so that baked clay tiles can rest on them. The flowers of the 'muhda',[3] the tree prized above all others, are eaten as well as dried and distilled for liquor; the fruit is pressed for oil. 'Anjan' (*Hardwickia binata*) yields a fibre that is used to make rope; its wood is burnt as well as used for making cots; its leaves are eaten by goats. Then there is 'temru' (*Diospyros melanoxylon*); its leaves are rolled to hold tobacco and smoked as bidis, its fruit eaten, its wood used to make carts. Finally, teak is used to make all agricultural implements—ploughs, hoes, rakes—drums and kitchen utensils; its wood is burnt; its large leaves are used to make packages for storing dried chillies or groundnuts.

The continuity between the forest, animal husbandry and cultivation is reiterated through rituals that seek to control and manage nature. Just as there are proscriptions against consuming certain crops during 'chaumasa' (the season of the rains), there are taboos about cutting green fodder and

teak leaves from the forest during the same season. Only when the gods have been propitiated after the rains can these products be used. In the 'gayana', the Bhilala song of creation, teak and 'pahal' (also called 'khakra', *Butea monosperma*) are as crucial in the myth as is jowar (sorghum) [Baviskar 1994].

Access to the forest enables adivasis of Alirajpur to hold their own economically. What is classified in government terminology as 'minor forest produce' is an integral part of what they live on. Besides self-consumption needs, they trade forest produce along with some of their agriculture produce for merchandise such as cloth, jewellery, iron implements and salt. And in years when the rains fail, the forest is refuge, they cut wood for sale in the market. As one adivasi observed, "during the drought, the forest is our moneylender". Whereas people from other drought-stricken areas are forced to migrate in search of a livelihood, the adivasis of Alirajpur who still have access to the forest manage to stave off starvation and avoid migration by selling forest produce. During a particularly lean summer, when asked why he and his fellow-villagers had not migrated for 'mazdoori' (wage labour), one Bhilala man replied, "we are doing *cheek ki mazdoori* right here". That is, villagers survived by collecting and selling the aromatic resin exuded from the 'halai' tree (*Boswellia serrata*).

The most controversial use of the forest by adivasis is not wood cutting, grazing or collecting forest produce (even though all these practices are blamed for destroying the forest), it is 'nevad'. The word 'nevad' literally means 'new field', or places that have been cleared and made suitable for cultivation. However, now it is used only to refer to encroached fields. There are two kinds of 'nevad'—revenue and forest, depending on which department happens to own the land encroached upon. In Alirajpur, forest 'nevad' is by far the more contentious category. The statistics about 'nevad' speak for themselves: the claims submitted in Sondwa revealed that each household cultivated 'nevad' holdings that were three to 10 times larger than its legal holdings. Since the size of legal holdings is too small for subsistence, it becomes imperative to supplement them with 'nevad' cultivation. 'Nevad' fields tend to be tiny patches of cleared forest, usually discreetly tucked away in the high hills. The land is generally sloping, with thin soils that are easily washed away. But despite its drawbacks, this land keeps the adivasi economy of Alirajpur on its feet.

Conflict over Forest

Since 'nevad' is crucial for adivasi survival, any attempt made by the state to stop it evokes immediate and strong reactions. Every time the forest department has tried to repossess 'nevad' fields, it has encountered widespread resistance. Adivasis refuse to surrender their 'nevad' because doing so would directly threaten their livelihood. They have made frequent representations to the administration to settle their claims through negotiation, but there has been no positive response to their call for a dialogue. The forest department, on its part, has rarely tried to find an amicable solution to this conflict,[2] preferring to enforce its claim with the unilateral use of force. Most confrontations have been sparked off when forest department parties have suddenly descended on an area and started digging CPTs (Cattle Proof Trenches), attempting to cordon off an area that may include grazing lands as well as 'nevad' fields. Such an incident occurred in March 1991 in Kiti village when the police fired to disperse assembled villagers from Kiti, Keldi and Vakner, who had been peacefully resisting CPT work.[3] In another instance, forest guards came with a herd of cattle and set them to graze on standing crops in 'nevad' fields that belonged to Semlani village in August 1993. Very often, the forest department provokes a confrontation by setting its labourers to digging holes in the middle of 'nevad' fields, ostensibly for planting trees, as was done in Pujara ki Chauki village. Since this work can never have local co-operation, the forest department brings in labourers from distant villages under heavy police escort. In the instances when the forest department's attempts to reclaim 'nevad' have led to retaliation in the form of villagers throwing stones, the crisis has been precipitated precisely because of the state's use of force at the very outset.[4]

It must be noted that, while enclosure is justified on sound grounds from the viewpoint of conservation, viz, it allows the forest to regenerate through protection and tree plantation, in practice enclosures made by the forest department rarely achieve this laudable objective. Despite cordoning off the forest and related measures like confiscating livestock found grazing in the forest and fining trespassers, the survival rate of planted saplings in most areas is so abysmal that it is difficult to discern the difference between the degraded forest and the enclosed portion which has had the benefit of the forest department's ministrations. We shall discuss the reasons for this failure later.

Besides the violent mass confrontations that have occurred in villages like Kiti, Semlani, Pujara ki Chauki, Umrath, Khodamba and so on, the conflict over the forest has also been a ceaseless war of attrition, by which the forest department has tried to terrorise adivasis into submission. As mentioned earlier, the legal weapons used include litigation and confiscation. The forest department has registered thousands of cases, many of them on trumped up charges, against adivasis for violating forest laws. This has trapped people in a wearying round of visits to the police lock-up and the court. The harassment and the expense entailed are considerable. People also risk getting their livestock confiscated and have to pay to get them back. If a pair of bullocks are confiscated at the time of ploughing during the crucial agricultural season, it can cripple an adivasi household's agricultural prospects for the entire year. If these forest offences are a measure, then almost every adivasi in Alirajpur is a criminal several times over.

More often than not, the means used by the forest department against adivasis are illegal. Villagers recount stories of the beatings that they suffered in the hands of forest guards. They remember times when the 'nakedar' or deputy ranger would enter their village and order that several hen be slaughtered and a feast of chicken and 'pannia' (bread cooked between leaves) and 'muhda' liquor be served for the pleasure of the officers. Earlier, forest guards would simply demand and receive a bottle of ghee or a bag of groundnut; no one dared resist. When called upon, an adivasi had to put aside his work and escort the forest official to the next village, carrying his bag for him. And a constant accompaniment to all these demands were the monetary bribes that villagers had to pay to persuade the forest department to look the other way.

Since 1982, the forest department's ability to get away with such blatant abuse of power has been sharply curtailed. A trade union called Khedut Mazdoor Chetna Sangath (Organisation for the Consciousness of Peasants and Workers) has mobilised adivasis in about 95 villages to collectively fight for their rights to the forest. When the Sangath has sent representations asking the administration to negotiate a resolution for the 'nevad' issue, it has been rebuffed. Since then, the Sangath has had to adopt more aggressive tactics like mass demonstrations, hunger strikes, and the obstruction of forest-related work. These have succeeded in putting an end to some of the excesses of the forest department, such as the petty violence and corruption. The Sangath's work is not defined by defending 'nevad'; its objective is the wider cause of empowering adivasis in their struggle to live with dignity, without being exploited and cheated, with control over the resources and processes that so vitally affect them. To this end, the Sangath has tried to work on several fronts—from organising a co-operative shop, teaching literacy in Bhili and Bhilali, to initiating a soil and water conservation programme, to generally strengthening adivasis' ability to stand up for their rights. For its troubles, the Sangath has been frequently called 'naxalite', the most recent sub-divisional magistrate (SDM) in Alirajpur going so far as to propose the

analytically interesting label of "semi-naxalite outfit masquerading as voluntary organisation" [Pathak 1994:10]. For the most part, the local administration has chosen to treat the mobilisation around the forest rights issue as a law and order problem, to be suppressed by means of state violence.

Tribal Development in Alirajpur

A few administrators, however, have perceived the links between the issue of forest rights and the condition of adivasis in general. Realising the immense hardship entailed if adivasis were forced to give up 'nevad', different administrators have initiated different schemes, all of them ultimately driven by the logic of getting adivasis out of the forest. Each SDM or district collector has his pet projects for tribal development. While each SDM usually manages to finish constructing the mandatory fountain in Alirajpur town during his tenure, the development programmes stay half-done, only to languish and die during the reign of the next SDM. Some projects are wacky in the extreme. One SDM proposed custard apple cultivation on 'nevad' land as the panacea for adivasi poverty, much in the manner of Marie Antoinette telling the peasants to eat cake. When people barely manage to grow enough grain to see them through the year, to expect them to switch to a highly perishable luxury crop, in a place where infrastructure for transport and marketing is practically non-existent, is a ludicrous idea.

The lure of lucrative markets beckoning enticingly from a distance works a powerful magic on administrators, most of whose schemes focus on getting adivasis further integrated into the market. Instead of strengthening their natural resource base or improving their access to basic services such as health, education or drinking water, government schemes tend to prefer giving a one-time subsidised commercial asset—a milch cow (the Madhuban scheme), a truck (the Raftaar scheme), which is supposed to generate income. In keeping with a view of life seen from the front seat of a Maruti Gypsy, the last SDM's pet project was road improvement. In 1994, the state government sanctioned Rs 2.06 crore under the Innovative Jawahar Rozgaar Yojana scheme for a year-long project that concentrated on helping 12 villages in the Alirajpur area. Of this, Rs 1.22 crore (59 per cent) was allocated for road construction; Rs 0.3 crore (14.5 per cent) for education (constructing two school and three hostel buildings); Rs 0.28 crore (13 per cent) for soil and water conservation; and the rest for health cover and drinking water [Pathak 1994]. This allocation of funds was sanctioned for a scheme intended to generate employment! Of course, employing people to build roads has always been a time-honoured device in drought-relief programmes. However, while road works provide short-term employment, they do little to address the root causes of poverty and unemployment. Such money could be used much more productively for soil and water conservation schemes which have the potential to create long-term employment and income, using local resources. But the SDM's expert opinion on people's priorities, and his prescription, prevails over the demands of the people themselves.

In a way, road building fulfils a social need, itself a consequence of poverty in Alirajpur. Roads facilitate migration out of the area. As the situation of adivasis deteriorates, their migration to urban construction sites and agricultural fields in neighbouring Gujarat has increased. The SDM's project proposal says as much: "The common feeling was that with a good road, public transport would increase and *people could go out of the area for employment*, as well as take their meagre exportable surplus outside" [Pathak 1994:9; emphasis added]. In the absence of adequate state investment for making the Alirajpur agricultural economy more productive, adivasis have no recourse but to labour elsewhere. In the summer, in some parts of Alirajpur that do not have access to forests, entire villages may be found deserted but for a few elderly people. Bhils and Bhilalas have traditionally migrated during times of famine; but now they migrate every year, in much larger numbers, travelling further and staying away longer. State tribal development programmes have not helped them survive; 'nevad' has.

IV
State Management of Forest

When the administration blames adivasis for destroying the forest through practices like 'nevad' and tries assiduously to stop them, it chooses to ignore its own record of forest degradation. All over India, the government has continued the colonial policy of managing the forest for maximising its own short-term profits, without respecting the rights of local communities to use the forests for subsistence [Gadgil and Guha 1992]. In Alirajpur, commercialisation of the forest started after 1869, when the princely state of Alirajpur, ruled by Rajputs, was placed 'under the superintendence' of a British Political Agent. Before that, the forest was left to the adivasis. As the term 'nevad' (literally 'new field') indicates, adivasis in Alirajpur seem to have been shifting cultivators who were free to move from one place in the forest to another. As long as they fulfilled their obligation of free labour for the king, and paid up their taxes (calculated as a fixed rate per plough), they could use the forest for meeting their subsistence needs.

Around 1870, adivasis were 'encouraged' to stop 'dahia' (shifting cultivation) and settle down. Guha and Gadgil observe that "...almost without exception, colonial administrators viewed [shifting cultivation] with disfavour as a primitive and unremunerative form of agriculture in comparison with plough cultivation. Influenced both by the agricultural revolution in Europe and the revenue-generating possibilities of intensive (as opposed to extensive) forms of cultivation, official hostility to [shifting cultivation] gained an added impetus with the commercialisation of the forest. Like their counterparts in other parts of the globe, British foresters held [shifting cultivation] to be the most destructive of all practices for the forest, not the least because it competed with timber operations" [Guha and Gadgil 1989:152].

Earlier there had been no clear demarcation between revenue and forest land and administration of both was vested in the same official. Within the jurisdiction of his village, the headman gave permission for expanding cultivation. With the tightening of colonial rule, the authority of the headman to permit fresh clearings in the forest came to be abrogated and was instead vested with state officials [Nath 1960:27]. In the process, property rights were sharply redefined. However, in the more remote parts of Alirajpur, such as Mathvad, customary rights continued to be respected. The ruggedness of the terrain and the absence of roads limited the extent to which forests could be exploited for timber. As long as the state received its due, the thakur turned a blind eye to 'nevad', the expansion of cultivation. Without competition from large-scale state-sponsored deforestation and the pressure of increasing population density, 'nevad' could remain politically and ecologically tolerable. It must be emphasised, though, that Alirajpur was unusual in its geographic isolation which insulated it for almost 100 years from the widespread commodification of the forest that occurred around this time.

From being an intrinsic part of peasant agriculture, forests came to be inserted into a commercial economy which sharply undermined the ecological basis of subsistence agriculture, hunting and gathering. While adivasis were being increasingly excluded from the forest and their customary use rights restricted, in most places this was not justified by the British on grounds of environmental protection, for no policy of conservation was instituted. Land was leased to contractors whose activities turned vast tracts of forest into semi-barren land [Aurora 1972:87]. Indian teak was extensively used in ship-building for the royal navy in the Anglo-French wars of the early 19th century and by the merchant ships in the later period of maritime expansion, as a substitute for the depleted

oak forests of England and Ireland [Guha and Gadgil 1989:145]. The expansion of the railways (1870-1910) for the movement of troops and trade in the subcontinent also resulted in widespread destruction of the forests for manufacturing sleepers. The British 'reservation' of the forests for their own use resulted in large-scale felling in this region too. In the summer of 1877, "though the [Narmada] was unusually low, a flotilla of 625 logs and 6,000 rafters was, after a month's passage, safely and without incident floated from the north-east of Akrani to Broach [Bharuch], where it fetched more than three times the amount spent on felling, dragging, and floating it down" [KG 1880:9].

Under the British, land was surveyed and new tax rates fixed on the basis of size and quality of landholding, not per plough or on the basis of ability to pay as had earlier been the case. As a result, state receipts from land revenue went up by 50 per cent. Colonial efforts to survey and enumerate, ostensibly to aid good governance, invariably ended up to their monetary advantage as well. The administrators made strenuous efforts to know in order to tax and take away; only vociferous objections from the populace held them in check. In Alirajpur, to this end, the Native Superintendent wrote that, "..I am of the opinion that all the Mangoe [*sic*] and Mowa trees within the Rajpore state should be enumerated and registered in a Book, which will prove of service when some disputes arise about possession. Also, it is possible, when all the trees have been enumerated, that a tax, which will be deemed fit, may be levied" [NAI[b] 1870].

With this view, measures were adopted to ascertain the total number of trees, but the work was stopped when the Bheel Agent was informed of the cultivators' 'displeasure'. The superintendent went on dismissively, "On this, I minutely inquired into the matter and informed Captain Cadell that they were not at all displeased on account of the trees, only they had entertained a doubt, which was removed by discontinuing the enumeration measures. But it is usual that the cultivators grumble and murmur at every new arrangement" [NAI[b] 1870]. Similarly, a list of about a 100 local trees and their various uses was prepared in 1894 with a view to their commercial exploitation [NAI[b] 1894].

The methodical mapping of tribal resources—the enumeration of the flora and its consequent exploitation, and the systematic shift to monetary taxation which commercialised agriculture—resulted in enormous deforestation and soil erosion, affecting people's ability to provision themselves on their own. The crushing pincers of the state's revenue exactions and the depletion of natural resources must have made survival even more precarious than usual, necessitating seasonal migration to the fields of Gujarat, Nimar and the Tapti valley in years when famine stalked the land.

Ironically, the only historical evidence of the destruction of forests and its consequences is the immediate and enormous increase registered in the state's income, mainly from land revenue, excise dues and forests. Statistics for Alirajpur state's receipts from 1901-02 to 1937-38 show a three-fold rise in total revenue over a period when the rupee did not change significantly in value. Land revenue grew from Rs 38,000 in 1901-02 to Rs 2,41,540 in 1937-38, an increase of 635 per cent. Excise receipts rose from Rs 16,000 to Rs 37,521, an increase of 234 per cent. Over the same period, the forest department registered the greatest rise, mainly from massive deforestation and the sale of timber; while it had generated Rs 11,000 in 1901-02, in 1937-38 it produced Rs 1,13,564—an increase of 1,032 per cent. Expenditure statements show that a good third of this revenue went to the maintenance and expansion of police and revenue collection agencies [Aurora 1972:82].

The dominance of commerce and colonial administration over the tribal hinterland was spatially represented by the emergence of towns at places where 'haats' (weekly markets) were held. According to traders in Valpur and Chhaktala (towns in Alirajpur tehsil), the institution of the 'haat' has existed since known times, but all the present permanent traders are immigrants who settled there four or five generations ago [Aurora 1972:69]. The 'haat' metamorphosed into small towns which were locations of institutions of political authority as well as points in the trade of produce. These towns served as nodes which channelled regional surplus into a national market. Forest produce such as timber, lac, mahua flowers, for example, would go from the 'haat' "to Dohad (Panch Mahals) and Kukshi (Dhar), the nearest foreign markets" [Luard 1908:604].

After 1947, when India became free, the kingdom of Alirajpur merged with independent India as a constituent of the state of Madhya Bharat. Jhabua district was constituted in 1949 and Alirajpur became a tehsil within it. Almost the first act of the new regime was to order a detailed land survey for permanent settlement. Titles to land were issued, soil types were assessed, and regular rates of land revenue were fixed. For the adivasis, land settlement was simply land alienation. Enumeration left out many 'nevad' holdings, either because they were too high up in the hills for surveyors to check comfortably, or because their adivasi owners had not paid adequate bribes to the patvari. Other adivasi rights to the forest were also curtailed, leaving only limited rights of usufruct which were channelled through 'nistar' depots run by the forest department. Thus adivasis were supposed to approach the forest department for their every need instead of going directly to the forest.

With the passing of power into the hands of the Congress nationalists after independence, the state embarked upon the project of 'development'. The independent state's agenda of progress called for accelerated industrialisation and modernisation together with a populist 'welfare' component in the form of anti-poverty programmes. The state was charged by the Constitution to "promote with special care the educational and economic interests of the weaker sections of the people, and in particular, of the scheduled castes and scheduled tribes, and [to] protect them from social injustice and all forms of exploitation" [GOI 1978:4].

To this end, Jhabua district was declared a scheduled area in 1950, and Bhils and Bhilalas were classified as scheduled tribes by 1956 [NCAER 1963:191]. Welfare measures such as ashrams (residential schools), income generation schemes such as the Integrated Rural Development Programme (IRDP), and government-controlled co-operative societies were started. However, most government programmes consisted of handouts in times of distress, especially during drought, which failed to address the underlying causes of adivasi impoverishment. Tribal rights to the forest remained unrecognised; their continued alienation from the land base upon which they depended for sustenance precluded any opportunity for genuine gains in power and prosperity.

This is not surprising when we examine the overall framework of the national policy for tribal areas and tribal communities in the country. According to the Report of the National Council of Applied Economic Research, the aim of the policy

> is to integrate the tribal communities within the body politic of the nation. This is sought to be achieved through raising the standard of living in the tribal areas to that in the rural areas of the country. Since the tribal areas are exceptionally backward and primitive, welfare of the people living therein is sought to be achieved through some measures of protection during the next 20 years. This protection is in respect of seats in parliament and legislatures, reservation in services of all types and categories, educational benefits and economic protection. The aim of the government is to level up the tribal communities without unduly damaging their social structure or interfering with the way of their lives [NCAER 1963:vi].

To this lofty end,

> top priority has been given to a programme of rapid industrialisation and extension of means of communication to the most

'interior regions' in the state. Our firm view is that the development of land and agriculture alone will not be adequate for the rehabilitation of the tribal communities. Agricultural land is insufficient and cannot serve the needs of even half the tribal population of the state. Fortunately, the tribal areas of the state are rich in industrial and power potential. There is no reason why in the wider interest of the nation and in the long-term interest of the tribals themselves, industries should not be developed and localised in tribal areas [NCAER 1963:vi].

In the 'wider interests of the nation', the state has exercised its prerogative of claiming eminent domain—the greater good of the people—to pre-empt resources for itself. Yet the pursuit of these policies has brought about rapid exploitation of natural resources in tribal areas, violating the interests of dispossessed adivasis. Between 1951 and 1976, 4,79,100 ha of forest were lost to river valley projects, and another 1,27,200 ha to establish industries [Gadgil and Guha 1992:196]. The colonial policy of 'scientific forestry' has become even more profitable after independence as industrial demand for wood has escalated.[8] In Madhya Pradesh, the state government recently announced that it will turn over degraded forest land to private industry for planting trees for their own use. It is well known that it is primarily the rural poor who depend on these degraded commons for fodder and fuel [Jodha 1994]. Their replacement by private timber and softwood plantations will further reduce villagers' access to resources essential for survival. The acceleration of extraction has been matched by the expansion of administrative control to further restrict adivasi use of the land and the forest. These regulations have become the source of a steady stream of remuneration for petty officials who browbeat adivasis who break the law into the submission of bribes and 'gifts' of omission. Meanwhile the forest department, legendary in its corruption, colludes with timber merchants to decimate the forest.

Forest Management Today

Aurora quotes the administrative report of Alirajpur state for 1939-40 which states that "about half the area of the state is under forests, of which 289 square miles is reserved forest and 149 square miles is unreserved forest" [Aurora 1972:59]. But even in 1939, much of this forest had been degraded due to timber extraction by the forest department. Since 1939, further areas were felled for timber as well as cleared for agriculture. The history of Alirajpur shows that forests were used primarily by the state to generate revenue for itself; an orientation that is reflected in present-day management practices as well.

By reserving the best forests for commercial timber, the forest department has closed off local people's access to the forest for meeting their subsistence needs. The village forests and pastures that would otherwise have met some of people's needs were anyway either destroyed or classified as reserved. In this way, the problem of 'biotic interference' is a creation of the management strategy adopted by the forest department which focuses on growing uniform crop and age timber forests. As M N Buch explains, "Had the forests consisted of the mixture designed by nature, with ground flora serving the needs of cattle, the lower and middle storeys serving the needs of the people in the matter of fuel and timber and the upper storey serving both environmental requirements and timber needs, even biotic intervention would have caused only a minimal damage to the forests" [Buch 1991:59].

The mandate of 'environmental conservation' has been given into the hands of a bureaucracy that has so far managed the forest for profit, both public and personal. It is now expected that forest officials, who have so far only been trained to measure diameter at breast height (DBH) and determine if a tree is ready for felling or not, will be competent judges of the ecological 'carrying capacity' of the forest. The orientation of the forest department has been towards maximum exploitation of the forest; there has been no evidence so far that the forest department has the knowledge, skills or sympathies to manage the forest for their conservation. Judgments about 'carrying capacity', an ecological concept that, in any case, is extremely hard to operationalise, will be made by forest officers who have the power to deny all long-standing rights and claims of local communities.

The draft Forest Conservation Act continues to have the same deadly bias that the existing Indian Forest Act contains: it entrusts the task of conservation into the hands of an organisation that lives off the forests and the adivasis. The official discourse on 'nevad' and 'biotic interference' chooses to disregard the unofficial transactions to which it has given rise. From the legal sanctions against adivasis' use of the forest derives the power of forest officials; the act has sown the seeds of a thriving corruption. People can have access to the forest, but for a price, usually payable in cash, fowl, ghee. If the forest department were to really cordon off the forest for conservation, this steady stream of income would dry up.

Another stream of unofficial transactions that would end if the mandate of environmental conservation were implemented in earnest is smuggling. The illegal sale of wood by forest department officials and contractors working together has been common in the better forested parts of Alirajpur. A more recent trade is smuggling 'halai' resin, trade in which is banned. In May 1994, a consignment of resin valued at Rs 2 lakh was intercepted by the Gujarat authorities outside the Alirajpur border. The smuggler in question was chagrined; his seth (financier-boss) reportedly paid Rs 20,000 per month to the Madhya Pradesh and Gujarat forest department checkposts to let his stuff go through unharmed. The previous year, when another consignment had been stopped on the state border, the smuggler negotiated an ingenious compromise: instead of confiscating and fining him on the basis of the value of resin in his truck, the forest department officials allowed him to remove the resin originally intercepted and replace it with inferior quality stuff so that the value of the consignment and therefore the fine payable on it would be considerably reduced. This generosity, of course, was made possible because of the fat bribes given by the seth to the forest officials. Conservation, properly implemented, would put an end to these mutually advantageous arrangements.

Since it is in the interests of the forest department to retain control over the forest, schemes for power-sharing with adivasis have never really got off the ground in Alirajpur. The Hitgrahi Yojana—a scheme in which forest land is leased to landless tribals for growing forest crops—was implemented in the mid-1980s as a compromise solution to the problem of 'nevad'. The entire cost of afforestation was to be met by the forest department, with a monthly cash grant being given for five years to support the adivasi till the forest crop matured. Adivasis were to have the right to the usufruct of the entire crop, including the corpus of the trees as may be grown and harvested. With the intervention of the Khedut Mazdoor Chetna Sangath, some villages of Alirajpur were involved in this scheme. People planted tree crops on some of their 'nevad' land, but their initial mistrust of the government was borne out when the promised monthly payments stopped after three or four months. After initiating the scheme, the government aborted it by providing inadequate funds. The Hitgrahi Yojana and other failed afforestation schemes such as the community woodlot programme [Chambers et al 1989:164] are precursors of Joint Forestry Management (JFM) schemes which, after succeeding in West Bengal, are being tried out in Hoshangabad and Jhabua districts in Madhya Pradesh. Whereas JFM has elicited enthusiastic popular participation in West Bengal [Viegas and Menon 1993], in Alirajpur the forest department has formed village forest protection committees without holding proper village meetings, selecting office bearers at will [Banerjee 1993]. Villagers have gained from temporary wage employment, but there has been no meaningful participation or sharing of power.

JFM in Alirajpur also seems to have gone the way of other government programmes.

Conclusions about Future of Conservation

We have seen that the forest department's efforts to protect forests have inherent contradictions and limitations which have brought about the present crisis in forest management. If power is further concentrated in the hands of the government, as the draft Act proposes to do, then the problem of forest degradation will be made infinitely worse. At present, there are few mechanisms to check the abuse of power by the forest department; increasing power without an accompanying system of outside control would place the forests and the people entirely at the mercy of the state. What then would be a better approach to ensure that the objective of environmental conservation is achieved? How would sharing power with adivasis show a way out of the environmental crisis?

The adivasis of Alirajpur are today living on the edge, forced to cultivate 'nevad' fields on fragile hill slopes and collect forest produce in order to avoid migration in search of work. They continue to be heavily dependent on the forest for their survival. Because adivasis have no security of tenure, and live under the constant threat of eviction, they cannot invest in improving their land. Their poverty prevents them from planting tree crops that have a long gestation period, and the illegality of their position precludes their receiving loans from the government for making agriculture more productive. Since adivasis' rights to the forest are not recognised, they have no stake in protecting it from the depredations of the forest department or from outsiders.

The first step towards recognition of adivasis' rights must be a comprehensive survey to systematically map all rights, claims and existing uses of the forest by adivasis. At present, rights are exercised on an *ad hoc* basis, as concessions grudgingly granted by the forest department. Adivasis have no guarantee that they will be allowed access to the forest on a regular basis. Therefore we urgently need a 'forest settlement', not to 'extinguish' or 'commute' rights, as the draft Act intends to do, but to recognise and incorporate them into a management strategy, into institutions and practices of participation. Secured access to the forest is a precondition for eliciting popular participation for environmental conservation. This implies that the state must also take the bold but essential step of settling legitimate 'nevad' cases. Ignoring the problem or trying to suppress it will impoverish the forest as well as the adivasis. And we must remember that it is adivasis who have a pre-eminent right to the forest, and not the state.

But regularisation of 'nevad' alone is not enough. Merely granting adivasis security of tenure and improved access to the forest does not equip them to improve the land or the forest. Considerable investment must be made for environmental conservation programmes to succeed. In addition, there has to be greater co-ordination between environmental conservation and tribal development programmes. Tribal development, which is presently a moribund affair, benefiting only the bureaucracy, has to be integrated with environmental conservation so that adivasis have a chance to create sustainable, self-reliant livelihoods for themselves. Both channels of state intervention—forest policy and tribal development policy—will only work if they articulate and address adivasis' felt needs. Such sensitivity has never been a distinguishing feature of top-down government policies; only when adivasis have acted politically has the state administration been forced to improve itself.

A group of villages in Alirajpur have demonstrated that the potential gains from political action in combination with environmental conservation work are infinite. The villagers of Attha, Gendra and Umrath have been active in the Sangath for several years. Their organisation into the Sangath, together with hundreds of other villagers, has allowed them to safeguard access to their 'nevad' fields. This collective sense of security has enabled them to invest in soil and water conservation measures on a large scale. Through a slow process of trial and error, people have tried to evolve a conservation strategy that works best for them. The Attha efforts are not perfect; activists' and villagers' interest and participation have flagged at times. But, despite the many setbacks, the achievements are there for all to see.

Work through the Sangath has concentrated on two fronts: improving 'nevad' fields and managing the rest of the forest for sustainable fodder yields. Labour collectives have worked on bunding and gully plugging to prevent soil erosion from the fields. One year, villagers ran a nursery to grow saplings for planting. When they found that trees planted in 'nevad' fields did not do well because they needed too much tending, people chose more manageable sites close to their houses. Since people could select tree species and plantation sites that best met their particular needs (field boundaries or close to their houses), survival rates were high, in stark contrast to the failed plantation work of the forest department. People have adopted innovative crop-mixes, combining bamboo and pulses for instance, and invested considerable labour and thought to use the land to optimal advantage. Since such conservation started, some 'nevad' fields have become showpieces worthy of any pampered agricultural extension station.

Villagers have collectively decided which parts of the forest should be closed to livestock to allow regeneration. They found that trying to save more distant patches of forest was harder; not only were they difficult to guard, but the competing claims of other villages often led to quarrels. Instead, people chose to cordon off forests close to their fields which are easier to monitor. People take turns to regularly patrol the closed-off area. The increased fodder output is shared among the members. People have now also started planting trees on forest land. The only response of the forest department to this initiative has been to file a 'panchnama', recording this 'offence'.

Why has Attha succeeded where others did not even try? One reason could be the increasingly acute scarcity of forest produce around Attha which forced people to initiate action themselves. Gondvani and Vicholi are two villages near Attha (not members of the Sangath) which started planting bamboo on their land since bamboo disappeared from the forest. Other villages in the Sangath, which do not face such an acute forest crisis, have contented themselves with protecting particular species or patches of forest. For instance, Bhitada and Nadi Sirkhadi, villages on the banks of the Narmada, stopped using 'anjan' trees which had been lopped mercilessly and have consequently been rewarded by tremendous regeneration. While scarcity is a factor in explaining interest in conservation, income is another [Chambers et al 1989]. Wherever people have earned from conservation, they have invested in it. Attha has reaped the benefits of conservation through increased supplies of fodder, wood and bamboo. But even a village like Khodamba, surrounded by dense and apparently abundant forests, has started protecting species like 'halai' which yields an aromatic resin that fetches handsome prices.

The change of attitude that underlies these initiatives is all the more remarkable when we remember the centuries of state control during which adivasis have often internalised the dominant ideology that they have no right to the forest. Physical and political alienation had created profound psychological alienation. After years of being made to feel like trespassers in their own homes, it requires a sea change in their perceptions for them to think that they have a stake in the future of the forest.[9] Even within the Sangath, this transformation of consciousness has been slow in coming. But wherever people have started protecting the forest, they have fiercely defended it against outsiders. The villagers of Khodamba, for example, have resolutely denied access to people from other villages. In Khodar village, a Sangath member has single-handedly

protected the forest adjoining his fields. Since he has laboured to take care of it, he regards it as his own. Now it is the forest department which is coming to be regarded as the interloper, not the adivasi.

The Attha example demonstrates people's preference for an approach where they have control over the conservation programme and where their rights are secured. However, a small financial base prevents them from expanding the scale of activity, and from undertaking works that require more bought materials (for water harvesting, for instance). People would like to travel to other places to learn from the experience of NGOs such as the Aga Khan Rural Support Project or Sadguru Water and Development Foundation in Gujarat. But while the SDM can bring Rs 2 crore to build roads, the adivasis of Alirajpur have to protect the forest and the land on their own. An organisation such as the Sangath can create a small island in Attha to show what is possible. But for all the adivasis in the Sangath, and for all the adivasis in India, such a transformation of the forest and of their own lives is possible only when political control is combined with control over the resources now commanded by the state.[10]

If the ministry of environment and forests (MoEF) takes its mandate of environmental conservation at all seriously, it will have to shed its unwillingness to facilitate people in doing things their own way, with their priorities foremost. Besides surrendering power over the forest into the hands of those who have a much greater right to it, the ministry must ensure that development resources are invested into this process. This requires legislative initiatives as well as administrative enterprise. The fate of the forest and the fate of adivasis are linked. As long as adivasis continue to be exploited and impoverished, so will the forest. The cause of conservation is inseparable from the cause of making adivasis' lives more secure, sustainable and prosperous. For environmental conservation, popular struggles have to be met half-way by an enlightened state. The ministry has previously shown its appreciation of these perspectives by encouraging fledgling efforts towards participatory forest management. It must not now fritter away its gains through a retrogressive act.

Notes

[Suggestions from Amit Bhatnagar, Walter Fernandes, Ramachandra Guha and Rahul N Ram greatly improved this essay. The author is responsible for the shortcomings that remain.]

1 *Madhuca indica*, or 'mahua' (in Hindi) holds a pre-eminent place in Bhilala culture, just as it does for adivasis all over central India. In the months of March and April, the white-green fleshy flowers of the 'muhda' fall to the ground and are collected and dried. They are used in cooking, relished as much for their sweetly pungent flavour as for their nutrients; but they are valued even more for the 'huru' (liquor) that is distilled from them, a clear, delicately potent brew. No ritual occasion can go unmarked by the ceremonial partaking of 'huru'. The fruit of the 'muhda' yields an oil that tastes rather like ghee.

2 The sole exception to this has been a short-lived scheme called the Hitgrahi Yojana which we will discuss later.

3 For a fuller account of this incident, see Baviskar (1994).

4 Recently, such a confrontation occurred in Chikhli village, Dhar district, adjoining Jhabua. The forest department tried to forcibly plant trees on Chikhli's traditional grazing land, classified as 'culturable waste' by the revenue department. Representations to the tehsildar asking that the land not be turned over to the forest department were ignored. On May 17, 1994, on hearing that forest department officials had arrived with labourers to start plantation work, people rushed to the spot. The range officer fired in the air to disperse them, then incited the labourers to throw stones at the villagers. Police intervention broke up this fight but, later, villagers were arrested on charges of rioting and intimidation [Shraddha 1994].

8 For an excellent account of the way in which forest management has changed since independence and yet remained the same, see Gadgil and Guha [1992: 185-214].

9 In colonial times, while adivasis were generally excluded from the forest, some practices of the former princely rulers exemplified an understanding of the 'stakeholder approach' to conservation. Raja Pratap Singh (1891-1920) planted mango trees along all major roads in Alirajpur, entrusting their care to neighbouring villages who were then entitled to half the mango crop in exchange for their labours. Today the produce of these trees is auctioned to the highest bidder and villagers have no interest in caring for the trees.

10 We now have several examples of successful decentralised sustainable development. The achievements of the Chipko movement are famous. More recently, the villages of Ralegan Siddhi in Maharashtra [Pangare and Pangare 1992] and Sukhomajri in Haryana [see Chambers et al 1989:155, for sources] have become well known. For other case studies, see Chambers et al (1989), Singh and Burra (1993), as well as periodic reports in *Down to Earth*, an environmental newsmagazine.

China's One-Child Policy

Implication for Population Aging

S Irudaya Rajan

China's one-child policy has been the subject of much debate ever since it was first adopted. How successful has it been in curtailing population growth? What will be the age structure in the coming years in China?

THE Republic of China was established in 1949 and prior to that, it was known as the 'sickman of east Asia'. In the 45 years of existence, China has made enviable progress in many areas. One such achievement is to curtail its population growth with a vigorous family planning programme.

As a background to this note, I would first briefly summarise the historical population estimates of China in different periods (Table 1). The population doubled between 1000 and 1200 but declined sharply during 1200-1500. In 1750, the estimated population of China was around 207 million thus added 293 million people within 150 years. It may be noted that the total population of China was 560 million at the time of its establishment. Since 1949, China has conducted four censuses, i e, in 1953, 1964, 1982 and more recently in 1990. As of July 1, 1990, the total population of China was 1.13 billion. Table 2 provides some demographic data regarding crude birth and death rates, total fertility rate and infant mortality rate from 1949 to the present latest available period.

Evolution of One-Child Policy

The National Planned Parenthood Conference (1979) held in China urged the country "to encourage the couple to have only one child if possible, two at the most with a period of three years between them". The same year, general liberalisation of state economic planning and the relaxation of central control were also introduced. In the Fifth National People's Congress of the People's Republic of China, the constitution of China was revised and the clause "the state advocates and encourages family planning" was incorporated in the constitution. In his report to the Congress, the then premier, Hua Kuo-feng stated that: "Family planning is a very significant matter. Planned control of population growth is conducive to the planned development of the national economy and to the health of mother and child. It also benefits the people where production, work and study are concerned. We must continue to give serious attention and strive to lower the annual rate of growth of China's population to less than 1 per cent within three years."

On February 13, 1980, for the first time in Chinese history, demographer Song Jian with two other social scientists projected the population of China for the next 100 years emphasising the need for strict population control for the success of economic liberalisation. Their controversial projections were featured on Chinese radio and television.

The main conclusions were as follows: (a) If every woman of child-bearing age has an average of three children beginning this year, the country's population will be 1.41 billion by 2000, 2.92 billion by 2050 and 4.26 billion by 2080. (b) If every woman of child-bearing age has an average of 2.3 children, China's population will also continue to rise for a long time, reaching 1.28 billion by 2000 and 2.12 billion by 2080 (c) If, beginning this year, every woman of child-bearing age has an average of two children, the country's population will continue to grow for the next 72 years, reaching 1 22 billion by 2000, 1.54 billion by 2052, the peak year. Beginning in 2053, the population will start to drop and fall to 1.47 billion by 2080. (d) If every woman of child-bearing age has an average of 1.5 children, China's population will reach 1.13 billion by the year 2000, and 1 17 billion by 2027, then the population will start to drop in 2028 and plummet to 777 million by 2080. (e) If the average birth rates begin to drop this year and is reduced to only one child per couple by 1985, China's population will continue to grow for the next 25 years and reach 1 05 billion by 2004 and decline to 960 million, the present population figure by 2028, to 613 million by 2060 and to 370 million by 2080.

On the same line of argument, Liu Chen and Wu Ts-ang Ping of Institute of Population Research, People's University of China, Beijing, wrote an article emphasising the economic rationale for population control in China. They maintained that only through population control, it will be possible to meet the realisation of the four modernisations, viz, agriculture, industry, science and technology and national defence and to meet people's demand in raising the standard of living.

On September 7, 1980, Hua Guofung, the chairman of Chinese Communist Party, on behalf of government, announced the National People's Congress (China's Parliament) of the New Population Policy. "Upon careful study, the State Council deems it necessary to launch a crash programme over the coming 20 or 30 years calling on each couple, to have a single child (except those in minority nationality areas) so that the rate of population growth may be brought under control as soon as possible. Our aim is to limit the population to a maximum of 1200 millions by the end of the century." In the same parliament session, the minister for education stated, "It has been estimated that in China to raise a child to the age of 16 costs 1600 yuan in the rural areas, 4800 yuan in small and medium sized towns and as much as 6900 yuan in larger cities. By these standards, as much as one trillion yuan has been spent by the state, the collectives and individual families on the 600 million persons born after liberalisation."

On September 10, the Chinese parliament revised the marriage law: The age of marriage for rural females was 23 years, for urban females 25 years and for males 25 and 27 years respectively. Students would not be allowed to marry. Moreover, if a person married three years over the prescribed official age at marriage, he or she was eligible for 15 days of marriage leave. If a couple postponed their first child up to three years after marriage, the woman became eligible for six months' maternity leave.

One child parents are issued a one-child certificate which guarantees them 5 yuan (1 dollar) for every month until the child completes 14 years and also gets priority in

Table 1: Population Estimates of China

Period	Population (million)
A D 14	73
1000	60
1200	123
1500	100
1750	207
1900	500
1949	560
1950	563
1960	650
1970	820
1980	983
1990	1132

Recent periods, from the respective census of China.

schooling, housing, health care and work. If the wife undergoes sterilisation after one child, then the husband along with his wife shall be eligible for some free leave.

There were some disincentives built into the population policy of China in the way of punishments. For the government workers, 20 per cent of basic salary would be cut for seven years and they would lose one increment and have no maternity leave, if they went in for a second child. Contract workers were dismissed with immediate effect, if they went in for a second child. The popular caption of those days in China was, "Late marriage, one child per couple, strictly control second births and, under no circumstances, need be a third child born"

Female Child

After the introduction of one-child family, there were lot of write ups in Chinese press regarding female infanticide and the frequent abuse of women who bear female children. On November 9, 1982, in an editorial titled, 'Save the Baby Girls', *China Youth Daily*, expressed concern over the growing abandonment and drowning of female children in China. It further warned that "20 years from now, a new social problem will arise—and large number of young men will not be able to find wives". The then prime minister Zhaxo Ziyang sent out a circular on December 6, 1982 to all the provinces urging them "to protect female babies and women who gave birth to girls from maltreatment and punish the offenders". Before discussing the above issue, let us have a preliminary look at the recent census data on China

Even after 13 years of the one-child policy, the 1990 Census in China reveals the following salient features regarding the population growth and structure. Table 3 briefly describes various features of the three censuses conducted in China whereas Table 4 outlines provincial data from the census with some demographic indicators and Table 5 provides the sex ratio by single age up to nine years as provided by the 1990 Census. The sex ratio (males per 100 females) is one of the features worrying the demographers not only in India but also around the world. The overall sex ratio of the population has not shown any increase or decrease in the course of the last 35 years in China, unlike India. It is very surprising to note that even after the introduction of the one-child family in China, the overall sex ratio has not changed and it is 106 as per census in 1990. However, the sex ratios calculated for the age groups 0-4 (children born during 1986-90) and 5-9 (children born during 1981-85), reveals a slightly different trend. The sex ratios have shown an increase from one census to another and the 1990 Census reported the highest sex ratio for the two age groups. Remember, these sex ratios are affected by infant and child mortality. If the mortality rates for females are higher than males, then the reported sex ratio in the 1990 Census for age groups 0-4 and 5-9 can be taken as granted. But the available evidence indicates that mortality rates for females are slightly lower than male mortality rates as reflected from the life expectancy at birth and child mortality (Table 6).

To what extent do the sex ratios vary by single years of age from 0 to 9? Table 5 reveals that the sex ratio at birth is reported as 112 indicating a suspicion of female infanticide, foeticide and sex selective abortions in China. Hull (1990) postulates three reasons for the high sex ratios among the younger ages in Chinese population: infanticide, gender-specific abortion and concealment of births.

Female infanticide has a long tradition in China, particularly in the eastern and south-eastern provinces. Two centuries ago, the practice of exposing infants to the elements was conducted openly, and Jesuit missionaries recorded that thousands of such infants were abandoned in the streets of Beijing to be collected regularly by carriers who placed them in a large common grave outside the city [Warren 1985]. Smith (1899) further stated that the destruction of female infants "seems to be most common in the southern part of China and specially in some provinces in which the Chinese themselves regarded it as a terrible and a threatening evil". The resurgence of infanticide in recent years was highlighted in the early 1980s in local press in China, and the government made numerous statements condemning the practice [Honig and Hershatter 1988]. Mostly, this explanation is based on the maintenance of 'traditional' patterns of female infanticide in China (as in many other societies for that matter, including India) and has been accepted

as an explanation of the statistical findings by a number of commentators on sex ratio, notably Coale (1984)

The second explanation is sex selective abortions, pregnant women having obtained information about the gender of the foetuses they were carrying and a number of them selectively aborting female foetuses. There are three relatively common methods of determining the sex of a foetus chorionic biopsy, amniocentesis and ultrasound examination. Some observers insist that amniocentesis and chorionic biopsy, which require relatively sophisticated medical facilities are not widely available in the towns and rural areas where the sex ratios are most abnormal [Hull 1990]. The third and the most important explanation in the case of China is that the fact of missing female births and missing female children is a statistical artefact the births took place and the female children are alive but concealed from the interviewers. According to an estimate by the public security ministry in China there are about one million 'black children', i e, children not registered with the authorities nationwide (Hull 1990, *Canberra Times* November 1, 1988)

Stressing on the third explanation, I would like to suggest a fresh outlook on the high sex ratio of the Chinese population, particularly in the age groups 0-4. Table 4 provides the provincial level data on various indicators from the 1990 Census including sex ratios for the general population, 0 4 and 5-9 age groups. Before making some comments on understanding the provincial situation in China, I would like to invite the reader's attention specifically on the columns 6 and 8 of the Table 4. Column 6 provides the sex ratio for the age-group 0-4 and column 8 gives the proportion of population below 5 years. The sex ratio varies between 102 and 118, the lowest in Xizang province and the highest in Guangxi. On the other hand, the lowest number of children is reported in Shanghai province with 6 per cent whereas the highest proportion (12 43) is found in Xizang province. Other things remaining the same (*ceteris paribus*), these two indicators speak about the births and deaths occurred between 1986 and 1990. There is a strong relationship between these two indicators, if the sex ratio of the age group 0-4 is very high then the proportion of children below 5 years should be small. In other words, the provinces in China which have a traditional practice of infanticide and the modern method of female foeticide should produce a high sex ratio of males in the population thus showing a decline in the proportion of children in the age group 0-4 because the female infants are killed after birth. The results revealed from the 1990 Census of China go against the explanation of infanticide and foeticide of female infants. Provinces such as Hebei, Shanxi, Anhui, Fujian Jiangxi Shandong, Henan, Hubei, Hunan, Guangdong, Guangxi Hainam, Yunnan, Shaanxi and Gansu have reported the highest sex ratios ranging from 108 to 115 whereas the proportion of children below

Note: Calculated from the 1990 Census of China by the author. Sex ratio is defined as males per 100 females

5 years hovers around 10.3 to 11.4. In fact, both the lowest sex ratio and the highest proportion of children below 5 years are reported in Xizang province, contrary to the commentators' views on infanticide and foeticide.

Another point I would like to raise here is sex ratio of first order births. The sex ratio at birth is expected to range from 105 to 107 males per 100 females in any population [Visaria 1969; Rajan 1993]. The one-child policy in China, in practice, propagated the first order birth to be the last birth. If the first order births are expected to be more males than females, then the reported high sex ratio in most of the provinces can be a statistical illusion. Thus blaming the Chinese society for widespread practice of infanticide and foeticide cannot be justified and it calls for further extensive research.

A few more observations can be made from Table 4. Though the one-child policy is reported to be a success, the provincial level data shows a different picture of fertility decline in China. The data indicates that only one-third of the provinces have shown a sharp decline in fertility rates and others are following the more developed regions. Thus the fertility decline is not universal in China, as in India. In India, Kerala has achieved the lowest TFR of 1.9 children per woman and the Uttar Pradesh has the highest TFR of 5 as of 1991.

As the fertility decline is expected to be faster in the case of China, it enters into another population problem, population aging. The highest proportion of aged population is found in Shanghai province and it is called as 'grey province' in China. One point which comes out quite clearly from the latest census in China is that the proportion of children below 14 is much lower than in India and also the demographically developed state of Kerala in India (Table 7). Thus one can conclude that the one-child policy is fairly successful in China.

Observations and Comments

Though the one-child policy exists in China, single child families are most common and noticeable in urban areas whereas in rural areas, most often the families end up with two children, with at least one male child. Chinese government officials admit that for every two live births, one abortion possibly takes place. Unofficial reports indicate that for each birth there is an abortion indicating widespread prevalence of abortion among the women in order to stick to the one-child family norm.

The study undertaken by the Population Research Institute in China indicated that 100 per cent of urban women had an experience of abortion whereas the reported percentage for rural women is around 60 per cent. The one-child family norm is so strict in urban areas that a person who produces a second child may lose his job. More than 90 per cent of women in China are using intra uterine device as a method of fertility control. In a survey conducted in China, 60 per cent of the women reported that they would like to have a second child because the first child is an experience and second child is more easy to bring up. Some of the rich Chinese take their wives to US to beget another child and then come back to pay a fine. Son preference is strong in rural areas rather than in urban areas. However, there is no difference in having male or female baby in urban areas because both have the same opportunity and same wages.

One person who was officially involved in formulating the one-child family policy insisted that this is the policy for a short time and not for a long time. Within the next 10 years there are chances that China will be able to change the population policy. In fact, the official population policy is not stringent as earlier and unofficially they seem to 'relax' in their attitude towards family planning. The age structure is getting worse and China will have an unbalanced age structure comprising more of the elderly in the immediate future. There are 70 million one-child families in China as of today and these 70 million children are to grow old without a brother or a sister.

Since the one child policy is practised more in urban areas than rural, the future children of urban China are expected to be more educated, more prepared for challenges as compared to those in the rural areas. Competition in the job market is expected to increase further in the future and rural youngsters will not be able to cope up with the skill required in the urban market. Thus the rural to urban migration is expected to decrease in the future along with an increase in the rural-urban disparity in income.

There are some psychological implications of the one-child policy. Very little research is done in this direction. One child is widely regarded as a significant handicap. Research psychologists Thompson and Maltes suggest that it is a 'cultural truism'—an unchallengeable given. Thompson also noted in a review that the only children are usually viewed as being selfish, lonely and maladjusted [Thompson 1974]. Another psychologist, Toni Falbo stated that the presence of siblings is popularly assumed to have both positive and negative effects but the lack of siblings is believed to have only negative consequences [Falbo 1977]. Against the above findings, Judith Blake argues from her data that on an average only children are intellectually superior and achieve higher educational and occupational status. In unmeasured, but important ways, only children may be less co-operative, less extending to others, less socially engaging, more individualistic and autonomous. Are couples in China faced with a trade-off between nurturing excess seeds and producing a single bad one [Blake 1981]?

Next in order is the population aging. The institutions for the care of the elderly are also limited. As of 1990, the elderly in homes (including sanatoria) are only 0.46 per cent of the total 116.8 millions. A recent survey conducted by the China Research Centre on Aging indicates that there are 25 per cent of elderly live alone or only with their spouse. In such cases, family support is not available.

7	1052589	967924	108.75
8	1143199	1060978	107.75
9	937618	874053	107.27

Note: Sex ratio is defined as males per 100 females. The figures are derived from calculations from the 1990 Census of China by the author.

It will be more harsh for the elderly in the future as the consequences of one-child family policy, for example, the decreasing children as potential care-giver and further nuclearisation of family. Seeking the alternatives to family support for the aged in rural areas and the government support for the aged in urban areas will be a challenge for the future China.

[Some of the observations and interviews were made while the author was in China from August 21 to September 2, 1993. The field trip to Beijing, China was jointly financed by Social Development Section, ESCAP, United Nation, Bangkok, Thailand, China Research Centre on Aging, Beijing, and China National Committee on Aging, China. The author was invited as a resource person to participate in two international meetings, one on International Symposium on Daily Life of the Elderly organised by the China Research Centre on Aging and Japan Aging Research Centre and another on the Training Workshop on Field Work Methods of Research on Aging organised by the China National Committee on Aging, China, and Social Development Section, United Nations, Bangkok. An original version of this note was presented at an internal seminar at Centre for Development Studies, Trivandrum. The writer is grateful to the following persons for preparation of this article: Guodong Hong, director, China Research Centre on Aging, Xiao Caiewai, deputy director, international department, China National Committee on Aging, Aimin Lau and Ma Yonghang, 1993-94 participants of the Global Training Programme in Population and Development commissioned by the United Nations Population Fund, New York.]

Calculating the Fiscal Deficit

R J Mody

SHOULD any capital receipt be taken into account in the calculation of fiscal deficit is an important question that I S Gulati attempts to answer (*Economic and Political Weekly*, May 21). To quote, "Strictly interpreted, since fiscal deficit is the excess of total government expenditure, i e, expenditure on revenue and capital account taken together over government's current revenues, no item of receipts on capital account should be allowed for the calculation of fiscal deficit."[1] The fact remains, however, that when the two items of capital receipts Gulati confines himself to are taken into account, it implies a lower fiscal deficit than that calculated on the basis of the above definition. Thus fiscal deficit is equal to total government expenditure minus the sum of the receipts on current account and the above capital receipts.

Some critics[2] have raised doubts regarding the receipts from public sector disinvestment for the above calculations, although they do not object to the other capital item, namely, recoveries from loans and advances as a receipt item for calculating the fiscal deficit. Gulati argues that there is a similar conceptual justification for treating both these items in the same manner. Both are in the nature of transfer receipts on capital account of the government.

In the capital account of the budget, there are two items on the payments side corresponding to the above two capital receipt items. Corresponding to the recoveries of loans, there is a sizeable amount given away by way of loans and advances which is treated as government expenditure. (From the point of view of economic analysis this is a payment and not expenditure which would imply demand for goods and services.) Corresponding to the realisation from the sale proceeds of public sector equity, there is public sector investment in the form of equity.

Doubt remains, however, regarding the rationale for including the above two capital receipt items in the calculation of fiscal deficit. The rationale has to derive from a well defined concept of fiscal deficit which will not leave any room for any arbitrary judgments based on the magnitude of the capital receipt in question.

Our argument is that the items to be included (or excluded) in the computation of fiscal deficit have to be decided on the basis of an objective criterion and the criterion should be relevant from theoretical and policy angles. Some alternative concepts are discussed in this comment. Each one may imply a different definition of fiscal deficit depending on the nature of the economy for which the concept is being used. The choice of the concept and the corresponding definition may depend on the objective of this fiscal policy instrument.

We need not take a particular definition of fiscal deficit, (for example, total government expenditure minus current account revenue) as sacrosanct. This will save us from the trouble of justifying why certain exceptions will have to be made in the computation of fiscal deficit. The objective criterion of defining fiscal deficit may either be in the context of public debt or macro-economic stabilisation. The former would imply a definition in terms of government's financial liabilities and the latter would imply a definition in terms of government's influence on aggregate demand for goods and services. It is strange that the Indian definition is in the context of public debt, but it is hoped to be useful for combating inflation.

The concept of fiscal deficit in the context of public debt may be in terms of an increase in the total financial liability of the government. Borrowings from RBI, public and external sources would increase the total liability (public debt). Thus fiscal deficit is equal to total government expenditure minus all government receipts except those by way of borrowing. Now which items are to be included in the computation of fiscal deficit is to be decided by the acid test whether or not total public debt increases. Obviously, recoveries from loans and advances of the government and sales proceeds from public sector disinvestment would reduce the amount required to be borrowed. Therefore, these capital receipts are included. This is the definition which is currently used in India's budget documents.

We have proposed an alternative concept in terms of *net* financial liability rather than *total* liability.[3] Government of India besides being a consumer and investor is also a financial intermediary engaged in lending and borrowing. This is not so in the US. The US government is a borrower, but not a lender to any significant extent. Moreover, there is no investment in the equity of public sector by the US government.

In view of the above features of the Indian economy, it would not be proper to focus only on the liability side and ignore the financial assets of the government. Ideally speaking, even the physical assets of the government should be taken into account while analysing the net liability. But, for simplicity, only financial assets and liabilities are considered here to define the concept of fiscal deficit as representing the *net* increase in financial liabilities. Alternatively, fiscal deficit is equal to government's expenditure on goods and services minus total revenue receipts. Net fiscal deficit is derived as follows:

Total receipts = revenue receipts + borrowing + recovery of loans+other receipts (disinvestment in public sector equity).

Total payments = expenditure on goods and services + loans and advances + repayment of loans + investment in public sector equity.

Since total receipts = total payments,

Net increase in financial liabilities (fiscal deficit) = total expenditure on goods and services – total revenue receipts ...(1)
= Net borrowing (Rs 54,915 crore) + recovery of loans (Rs 6,700 crore) + other receipts (Rs 4,000 crore) – loans and advances (Rs 6,167 crore) – investment in public sector eqity (Rs 3,664 crore) ...(2)
= Rs 55,784 crore (Budget Estimates 94-95).

Fiscal deficit, as defined in the budget document amounts to Rs 54,915 crore for the year 1994-95. The earlier mentioned capital receipts in question tend to reduce the need for borrowing and, therefore, reduce fiscal deficit. On the other hand, if fiscal deficit is defined in terms of net increase in financial liability, these capital receipt items, namely, recoveries of loans and public sector disinvestment reduce the financial assets and increase *net* financial liability of the government. Therefore, they would add to the fiscal deficit. This takes care of the objection of the critics. Moreover, Gulati's argument for treating both the items in the same manner is also sustained. Since loans and public sector investment in equity by the government increase the financial assets, they reduce the net financial liability. These items would tend to reduce the fiscal deficit. Fiscal deficit thus defined amounts to Rs 55,784 crore for 1994-95. The government has recently accepted our view and, therefore,

TABLE: US GOVERNMENT OUTLAYS AND REVENUE (1980-1988)

(Percentage of GNP)

Federal Outlays		Federal Revenue	
(a) National defence	6.0	(a) Individual income	8.8
(b) Entitlements and other mandatory spending	10.9	(b) Corporate tax income tax	1.7
(c) Non-defence discretionary spending	4.6	(c) Social insurance tax and contributions	6.5
(d) Net interest	2.8	(d) Other	2.0
			19.0
		Fiscal deficit	4.2
	23.2		23.2

Source: Dornbuch and Fischer, *Macro-Economics* (vth edition), p 601.

has made a distinction between gross and net fiscal deficit in the *Economic Survey* for 1993-94.[1] The budget document still uses the 'gross' concept. The 'net' budgeted deficit is actually higher than the 'gross' deficit.

Another set of concepts of budget deficit is in the context of fiscal policy as it influences demand for goods and services. This is useful for macro-economic stabilisation. It may be argued that the earlier concept related to public debt may also be relevant from the point of view of stabilisation if public debt is treated as wealth in the portfolio of the public. The required condition here is that the wealth effect on aggregate demand is positive and significant. This is a theoretically controversial issue since, on the one hand, the Barro-Ricardo equivalence proposition would support the hypothesis that public debt may not be treated as wealth, while on the other hand Blanchand, Bergheim and others argue in favour of the contrary hypothesis. However, empirically, the question is not important in India since most of the public debt is held by financial institutions for whom the wealth effect is not relevant.[3]

There are two concepts of budget deficit which may be relevant from the point of view of stabilisation. One is based on the modernist view and the other is based on the Keynesian view. The former is the traditional Indian concept of deficit finance which is approximately equal to the government's borrowing from the RBI. This borrowing would increase high powered money and the quantum of money. This approach assumes a stable money multiplier and a stable demand for money function. Given the latter, changes in money supply would influence aggregate demand for goods and services in a stable manner. The budget deficit thus defined is relevant for economic stabilisation.

Another variant of the above concept is the monetised deficit as suggested by the Chakravarty Committee. This measures an increase in the holdings of government debt by the RBI which captures the effect of monetisation of public debt during a year. Budget deficit as proposed for the year 1994-95 is only Rs 6,000 crore, i e, about 0.5 per cent of GDP. This may appear to be quite modest. But, as we have argued elsewhere, the monetised deficit should be negative this year. In other words, the RBI should actually reduce its total holdings of government debt in order to counteract a part of the expansionary effect of its increasing foreign exchange reserves. According to the revised budget estimates, budgetary deficit during 1993-94 was Rs 9,060 crore, i e, about 1.1 per cent of GDP. However, foreign exchange reserves increased by about $ 6 billion, i e, approximately Rs 19,000 crore. Both these factors would increase high powered money. In order to counteract the effect of growing foreign exchange reserves, there is a case for a budget surplus.[6]

Having examined the monetarist view of the budget deficit relevant for the stabilisation policy, let us look at the Keynesian concept internal aggregate income and expenditure in the economy. This can be derived in the framework of national income accounts as follows:

Income = consumption (c) + saving (S) + taxes (T) − transfers (TR)

Expenditure = consumption (c) + investment (I) + government expenditure (G) + exports (X) − imports (M)

Since income = expenditure,

$$S + T - TRG\ TRF = I + G + X - M \quad ...(3)$$

(where TRG and TRF are net transfers in the government sector and the foreign sector respectively).

Therefore,

$$(I - S) + (G + TRG - T) + (X + TRF - M) = 0 \quad .. (4)$$

For macro-economic stabilisation, the sum of the three gaps should be zero. If it is positive in the ex-ante sense, aggregate planned demand for goods and services will exceed aggregate supply and, therefore, there will be a price rise. The three gaps are investment-saving gap, the fiscal deficit and the surplus on the foreign sector's current account. The first two gaps create pressures on the external front and hence the balance of trade crisis [Eq (4)]. If investment (I) includes government investment, then G is to be interpreted as only government expenditure on revenue account. Then the gap (G + TRF - T) implies a deficit on revenue account. On the other hand, if (I) excludes government investment, then G is to be interpreted as all government expenditures on goods and services and, also, net transfer payments. In this case fiscal deficit is to be defined as total government expenditure (including capital expenditure, but excluding payments by way of loans and advances) minus taxes. This concept of fiscal deficit does not include recovery of loans and proceeds from the sale of public sector disinvestment. This definition of fiscal deficit (G + TRG − T) is relevant from the point of view of stabilisation in the Keynesian sense.

The total revenue expenditure proposed in the 1994-95 budget is Rs 1,18,811 crore and the total capital expenditure, excluding that on loans (Rs 6,167 crore) and investment in public sector equity (Rs 3,664 crore) which do not imply demand for goods and services, but imply increases in financial assets, is Rs 23,057 crore. Thus the total expenditure is Rs 1,41,868 crore. The total revenue receipt is Rs 86,084 crore. Thus the fiscal deficit is Rs 55,784 crore.

Conclusion

It may be observed that the fiscal deficit defined from the Keynesian view of macro-economic balance is the same as the one we have proposed on the basis of *net* increase in financial liability [Eqs (1) and (2)]. Obviously, the gap between expenditure on goods and services and revenue account receipts will be filled by net changes in financial assets and liabilities. Thus budgetary gap in the Keynesian sense has to be equal to net fiscal deficit. This is a definition which is based on sound theoretical principles. This concept should be adopted in India if economic stabilisation is the goal of fiscal policy.

The definition, namely, government expenditure (including loans and advances) minus current account receipt has no theoretical foundation. The definition currently used in the budget document, i e, the gross fiscal deficit which treats recovery of loans and public sector disinvestment as receipts is based on the concept of total liability (public debt). This concept is relevant if the goal of fiscal policy is to regulate the growth of public debt. The gross and net fiscal deficits for 1994-95 are estimated to be Rs 54,915 crore and Rs 55,784 crore respectively.

All the above definitions almost measure the amount for a country like the US since the US government is neither a lender nor an investor in public sector equity in a significant manner. The US definition of fiscal deficit is simply federal outlays minus federal revenue. The fiscal deficit in the US for the period 1980-88 is as shown in the table.

Thus, the fiscal deficit in the US during 1980-88 amounts 4.2 per cent of GDP. It may be observed that capital receipt and expenditure items of the type mentioned above do not appear at all in the US budget. Therefore, under 'gross' and 'net' versions, fiscal deficit would work out to the same amount. The Keynesian concept relevant for stabilisation policy would also coincide with the above measure. The institutional framework is different in India and, therefore, a theoretically consistent concept has to be redefined.

We have argued elsewhere on the basis of cross-section time series data for 28 countries that the monetarist definition of budget deficit appears to be more relevant for stabilisation policy.[7] The good old Indian concept of deficit finance is quite sound as compared to the newly imported concept. Of course, along with the regulation of deficit finance, the other factor influencing monetary expansion, namely, foreign exchange reserves will have to be considered as in the current context.

Vol XXIX No 39 September 24, 1994

Financial Liberalisation

The basic questions relating to financial liberalisation may be grouped under two broad categories. First and the most important for developing countries, to what extent has private initiative to be supplemented by state intervention for creating an efficient financial structure? Second, given the structures of the financial system, is there any scope for public authorities to influence or suspend the operation of market forces in order to promote saving, investment and allocative efficiency in the system? **2547**

Land Relations

An examination of changes in the distribution of landholdings over a 30-year period shows the persistence of glaring inequalities and a worsening of land concentration at the middle level. The majority of rural households at the bottom of the landownership hierarchy have remained unaffected by land redistribution. It is against this background that land reform remains a critical area for policy intervention. **A-117**

Though attached labour is still perpetuated through prolonged indebtedness and obviously has elements of unfreedom, counter-tendencies are also significant. Weakening of the ideology of patronage and loyalty, availability of employment outside agriculture and growing dislike of the relationship among labourers have given rise to tensions and conflicts leading to a gradual decline of the system. **A-102**

Analysis of data from village surveys in Kanyakumari district in Tamil Nadu shows that both the incidence and the form of tenancy are governed by the irrigation situation and changes in it. **A-129**

Drug Policy

The drug industry has to be viewed differently from other industries and abandoning price and production controls in the hope that the market will regulate prices can have disastrous consequences for the health of the majority of the people. **2526**

Kamani to Kanoria

Workers' co-operatives, as a solution to industrial sickness and closures, are perfectly in keeping with Marxist principles and philosophy and the Marxist parties and trade unions in India must support them. **2533**

Hindu Nation

In his last five years Bankimchandra composed three historical novels on Hindu-Muslim antagonism and two polemical essays on an authentic and reinvigorated Hinduism to be attained through a disciplinary regime which he spelt out in detail. **2553**

Away from Land

What are the dominant forces at work in the process of economic diversification in rural areas? A study of Gujarat. **A-107**

Managing Water

Instead of setting up a single centralised framework for regulating ground water, it may be useful to create a legislative superstructure that would enable and guide the formation of locally appropriate management institutions and approaches. **A-135**

In the context of the patent failure of current water related policies as well as the instruments and institutions through which they are implemented, it is time to seek more durable, though politically harder and technically challenging options such as the institution of a water rights system. **A-147**

Peace at Last?

After South Africa, Palestine and now Ireland, is it finally Sri Lanka's turn for peace? The prospects and challenges of Tamil self determination. **2537**

Censorship

Partly as a genuine reaction to the abuse of freedom for mercenary ends, but largely as a manoeuvre to exploit the abuse for political ends, moves are afoot in New Delhi to curb the freedom of the film maker. **2521**

Convention on Rights of the Child

INDIA's accession to the UN Convention on the Rights of the Child in December 1992 was an important step towards initiating accountability of the Indian state towards the survival protection and development of its children. The Indian government is expected to submit its report on the measures it has adopted which give effect to the rights outlined in the Convention to the Committee on the Rights of the Child in Geneva in December 1994. The process of reporting to the Committee provides an opportunity to NGOs to formulate an alternative report based on their experiences on the situation of children in India.

A Working Group comprising NGOs and individuals representing diverse disciplines such as advocates, trade unionists, sociologists, economists and educationists has been formed. This group will work towards compiling a comprehensive report on the *Situation of the Rights of the Children in India* with the focus on the situation of children of disadvantaged communities. You can participate in the drafting of the Alternate Report on CRC by

(a) Providing information/case studies on violations of the provisions of the CRC.

(b) Sending us press cuttings on reports/instances where child's rights have been abused by insensitive attitudes or actions. Also reports/instances where children's rights have been protected or promoted by a positive action or attitude.

(c) Examples and instances where actions have/have not been taken by city/district administrations, state/central governments to ensure that standards of the Convention (as outlined by the articles of the Convention) are achieved.

(d) Actions could include (i) wide publicity to the CRC to make all sections of the society aware of the CRC (ii) revision/amendment of legislations (iii) updating of policies, programmes and schemes by district, state/central governments for bringing them up to the standards of CRC, and (iv) specific actions for promoting mechanisms established for the protection of the rights of all children.

(e) As an NGO/individual working in a specific area of child development are you and forums that you are associated with advocating any changes in existing legislations, policies, programmes, etc? If you are than please do share the information.

Please send all the information, data case studies and reports by October 25 1994 latest. Any material reaching us after that might not have prospects of being included.

The Working Group seeks to develop this exercise into a national initiative of committed voluntary organisations and individuals. The final report for submission to the UN Committee on the Rights of the Child will acknowledge individuals, organisations and groups providing information, data and assistance in writing the report. Please send your replies/queries directly to: The Secretariat, Working Group on CRC, c/o 'Butterflies', C-7 Green Park Extension 1st Floor, New Delhi 110 016.

Humanscape Fellowships

Humanscape, a monthly magazine published by the Foundation for Humanisation is nearly a year old. It was launched with humanist intentions and aspiration. *Humanscape* identifies several issues such as poverty, education public health, unemployment, quality of life unorganised sector labour etc, which require to be seriously researched and investigated from a humanist standpoint in the measure these issues actually affect people and individuals. The *Humanscape* Fellowships have been instituted to facilitate hard working and concerned journalists/social researchers who really want to get a message across, to relate 'real' stories about people at the grass roots.

The central theme of such work should be based on keeping the human being as a central value and focusing on ways of making positive changes in individuals and society. The work should also aspire to inform individuals, institutions and society in general, of humanist proposals thereby promoting the dissemination of facts and ideas, and encouraging discussion of them. The concerned journalists/social researchers should get in touch with affected people, contact respective authorities, contacting individuals/NGOs working in support and specialists in respective field, investigate anti-humanist elements, research and compilation of data, taking account of humanist stands, and propose likely solutions. The projects reports will be written in the form of 10 articles with photographs, each covering the issues at stake, people, supportive statistics and proposals. The duration of the fellowship is three months in Bombay with a stipend of Rs 2 500 per month plus actual expenses for 10 articles. The entire work will be published in *Humanscape* and in other publications through *Humanscape*.

Please send a detailed resume and copies of published work to *Humanscape* 11 Yogniti, 18 S V Road, Santa Cruz West Bombay 400 054. Telefax on 6119513 Or call 6106197/6119513.

ECONOMIC AND POLITICAL WEEKLY

Unheeded Signposts

"EPIDEMICS are like the large signposts from which a statesman of stature can read that a disturbance has occurred in the development of his nation, which not even careless politics can afford to overlook", wrote Rudolf Virchow, the German physician-scientist-statesman and father of social medicine, in 1848. The plague deaths in Surat and the adjoining areas and the cases in Beed are a vivid and emphatic signpost of the breakdown of public services in this country.

Let us look at the compendium of failures: As early as September 21 when so many patients were being admitted to public hospitals in Surat and attending doctors were suspecting plague and petitioning for medical and other supplies, the authorities chose not to take note of the warning. As a consequence, some 64 patients discharged themselves and, without a clue to the gravity of the situation, contributed to the spread of the disease. Patients' relatives and family members were neither provided with antibiotics nor given essential information. It is also likely that the earlier cases of possible bubonic plague did not even make it to the hospitals or ill-informed private practitioners turned them away with routine medicines. Let us go back further, to when Surat experienced floods, which, as the concerned authorities put it, were 'man-made' because of the decision to release water from a dam which would otherwise have overflowed. In the typically blinkered and fragmented approach to public services, the authorities failed to ensure the safety of livestock and livelihoods; and later, to make the situation worse, the Surat municipality left the large numbers of animal carcasses to rot and become breeding grounds for rodents. Then again, Surat is acknowledgedly the 'dirtiest' city in the country – it is among the cities which have registered very high growth rates in the last decade, without concomitant development of urban public services. While it is the centre of diamond trade and the new industrial expansion, especially based on petrochemicals, it also houses some of the poorest and the worst exploited labour, a large section of whom are migrants from neighbouring states. It is a city made to order for the rapid spread of any contagious disease. Such distorted growth has occurred in many urban centres; it just so happens that a combination of factors has made Surat the focus of the current epidemic.

Inevitably, there is a growing exodus of people fleeing a city which offers no sense of security or prospect of treatment. And they flee to the nearby gigantic metropolises which apparently offer hope. But Bombay's response has been another tragic note. It took three days for the Bombay Municipal Corporation (BMC) to even decide to go into action, in which time hundreds had already poured in from Surat, some perhaps carriers or already suffering. And what is the BMC's plan of action? At the top of the list is clearance of garbage which had not been done lately "because of a shortage of trucks" and removal of silt which has been blocking the drains. In other words, routine services necessary to maintain a city in health are now being undertaken – as emergency measures. Some of the other disclosures which have tumbled out in the ensuing discussions are no less dismal. For instance, Bombay has a rat population of 50 crore. And this is the country's most prosperous city in the country's most prosperous state.

There is further evidence of this 'well run' state's efficiency. It was in the first week of August that the first cases of plague were reported from Beed adjoining the region hit by earthquake last year. (Pending fuller pathological reports the diagnosis is, of course, tentative.) What was the government's response? Typically, it first denied the diagnosis, then various functionaries made contradictory statements supposedly aimed at reassuring the population. The National Institute of Communicable Diseases categorically stated that the Maharashtra government had been warned of the possibility of plague in the area but had taken no steps to institute control measures. With remarkable placidity the government did not even begin production of anti-plague vaccine at the state-run Haffkine Bio Pharmaceutical Corporation, the only manufacturer of the vaccine in the state. The company has no stock of the readily usable vaccine because there has been no incident of the disease for more than 30 years and it takes a couple of weeks to start production. As a result, when the Surat cases began to turn up no immunisation was possible. Further, had people's health been a concern and the study of developments in society an instrument for structuring policy according to the needs of the people, the concerned state governments would have monitored the migration of people in search of livelihoods after the earthquake. This could have led to cognisance of the possibility of entry of carriers of bubonic plague into Surat.

While there can be no justification for the disgraceful breakdown of public services, the state may well contend

that the fact that plague had ceased to be a threat to public health was a reasonable enough explanation for its unpreparedness. Here again is another disjuncture in the development process. Not so long ago entomological researchers had in the course of their investigations on the rat flea found to their surprise that the nature of changes in the flea and host rodent populations was such that an outbreak of plague could be imminent as a consequence of any sort of ecological disturbance such as the Latur earthquake or the Surat floods, which would drive wild carrier rodents to mix with the urban species. Not surprisingly, these research findings remained a scientific contribution with absolutely no interface with public policy. Secondly the state has in its annual budget an item 'plague organisation' under which is allocated a pittance—originally no doubt intended for surveillance and monitoring but clearly just a cosmetic gesture today.

It is not that there have not been other signposts of coming public health disasters. The resurgence of malaria is an example of the deterioration of the urban environment as is the continuing spread of tuberculosis. Even apart from these the general morbidity patterns and the newer symptomatologies becoming evident in the expanding cities should have been cause for concern a long time ago. The state's response to urban growth has been to talk of stemming the influx of populations into cities and towns. As a consequence urban policy if one can call it that has been a sort of apology—something that has to be spelt out only because of the failures of development in rural India. In the 150 years since Virchow pointed out that medicine was politics developments in the science have been such that there is a medical therapy for most human ills; the rot is in the political roots of society.

INDUSTRIAL GROWTH

Case for Caution

AFTER three years of depressed conditions reports from industry associations as also the production indices for the initial months of the current financial year point to a notable revival of industrial growth. Following the initiation of the stabilisation and structural adjustment programmes the index of industrial production (base 1980-81=100) had shown insignificant growth of 0.5 per cent, 2.3 per cent and 3 per cent in the last three years, after a decade of near 8 per cent per annum growth in the 1980s. The index for April this year has now shown a rise of 8 per cent and that for May of 8.7 per cent over the corresponding months of last year. This is all the more striking because no particular signs of recovery had been visible in the closing months of 1993-94. Even in this March the index had shown zero growth, though some of the earlier months of 1993-94 had seen seasonal spurts ranging from 5 to 7 per cent. The abrupt turnaround in industrial production, while it is most welcome, raises interesting questions about the nature of the growth as well as its causes and sustainability. In the absence of fuller data, however, discussion of these issues can only be tentative at best.

That the industrial picture is far from clear is evident from the movements in the official index number series. The Central Statistical Organisation(CSO) had put the general index for this April at 225, an increase of 8 per cent over April last year. But while releasing the May index, the April figure has been revised down to 222.5, which gives an over-the-year rise of only 6.9 per cent. The May index has been put at 226.5 marking a rise of 8.7 per cent over the 12-month period and of 1.8 per cent over the previous month which is quite remarkable. The index for capital goods industries has been similarly subjected to sharp revisions. The CSO had placed the index for this April at 206.4, but it has now been revised downwards to 202.3, thus pushing up the subsequent growth rate significantly. The significant revisions in the industrial production index in recent years has naturally given rise to misgivings about the reliability of the data.

There appear to be other serious problems as well but in the absence of fuller details only a few illustrations can be cited. Take the general index for March and April. The index for March this year jumped by 12.1 per cent over that for February but the April index dipped by 16.4 per cent over that for March. These lurching movements have been especially striking in the indices for certain industry groups, such as capital goods. In 1993 the index for capital goods had shot up by 51.4 per cent in March over February and then fallen by 47.5 per cent in April over March. Almost identical movements had occurred in March and April 1992. It may be that companies indulge in window-dressing to show higher output in their balance sheets, but the phenomenon was evident even when not all companies were closing their accounts in March. It may also have something to do with the government's fiscal year and tax collections, though the connection between physical output and tax payments of industrial enterprises is not immediately clear.

Similarly, the weighting diagram for the current series with 1980-81 as the base had been criticised for the addition of high growth industries and deletion of low growth ones. Despite the criticism the government has not cared to get the series revised. Government spokesmen have in fact sought to argue that if a more representative weighting diagram were used, the industrial growth rate would turn out to be higher. But this is to ignore that a representative weighting diagram would have to take account of the large number of industrial products which have been deliberately left out in the compilation of the index, giving rise to misgivings about the representative character of the index number series itself. There are also other issues such as speedy and accurate collection of statistics from industrial units and the method of deflating the nominal output figures to arrive at real numbers. This is particularly important for machinery items included in the index for the capital goods sector, the output of which is reported in value terms. As it happens, according to the index, the output of capital goods shows a rise of as much as 17.9 per cent in April-May this year over the corresponding period of last year. How seriously is this to be taken?

Leaving aside the question of reliability, there is no doubt that the recent industrial growth, impressive as it appears to be, has been limited to a narrow range of industries. The overall index number for April-May this year shows a rise of 7.8 per cent over the corresponding period of last year when the index had risen by just 0.8 per cent. The increase in manufacturing has been 9.2 per cent compared to a fall of 0.9 per cent in April-May last year. The index for mining in April-May this year has shown a fall of 0.5 per cent against a growth of 2 per cent last year and that for electricity a slight reduction in growth rate to 7 per cent from 7.9 per cent.

It is thus the growth in manufacturing that seems to have made all the difference this year. A scrutiny of the CSO data suggests that of the 9.2 per cent growth in manufacturing in April-May this year more than 55 per cent is attributable to just two industrial groups, namely, electrical machinery and appliances (weight 5.78 per cent) and transport equipment and parts (weight 6.39 per cent) which have grown by 25.2 per cent and 22.7 per cent respectively during the period.

In transport equipment, the preponderant contribution has come from automobiles. Likewise, in electrical machinery and appliances, the output of white goods has made a major contribution. Taking the capital goods sector, about 80 per cent of the growth of 17.9 per cent in April-May this year has come from medium and heavy commercial vehicles. Such disaggregated information is not available in the CSO's press releases, but data put out by industry associations and a special survey carried out by the Confederation of Indian Industry (CII) point to certain revealing trends. According to these sources, the output of medium and heavy vehicles shot up by 130.4 per cent, from 12,000 in April-July

1993 to 27,600 in April-July this year, and that of light commercial vehicles rose by 46.7 per cent. Similarly, output of cars went up by 17.3 per cent, scooters by 27.7 per cent, motor cycles by 32.8 per cent and three-wheelers by 62.6 per cent. It could thus be said that industrial growth is being led by the automobiles group which as a whole has registered a growth of 29 per cent. In the case of commercial vehicles there had been a substantial loss of production in the last two years which is now being made up, presumably under the impetus of better agricultural growth. In the case of cars and other passenger vehicles, the demand has been stimulated by easy availability of commercial bank credit. In addition to automobiles, output of air-conditioners and refrigerators has risen by 29 per cent each and consumer durables as a group have reported a growth of 20 per cent in April-July.

Its narrow base is definitely enough reason for tempering the euphoria over the rise in industrial production in the current year so far. Apart from consumer durables and commercial vehicles, the industries showing sizeable increases include fertilisers, different varieties of man-made fibres and yarns and some chemical items, the total weight of which industries is unlikely to be more than 20 per cent in the general index of industrial production. There are also cases of industries such as paints and varnishes and cotton cloth in which, to an extent, the apparent growth of output in the organised sector has been in replacement of loss of production in the small-scale sector as a result of the finance minister's decision to narrow excise duty differentials. The organised sector is now in a position to price out small-scale units and, over the medium term, this will have serious implications for employment generation in the non-farm sector and for regional dispersal of industries. In the paints industry, for instance, it is well known how the erstwhile excise duty concessions for small-scale units had encouraged the growth of over 2,500 units in different parts of the country which is now being scuttled under the current excise duty structure. The same is true of cloth output in the decentralised sector.

An even more disturbing picture of the regional distribution of industries under the new market-driven policies is emerging from the data generated from the industrial entrepreneurs memoranda(IEM) which, under the new industrial policy, all proposers of new investment have to file with the Secretariat for Industrial Approvals (SIA). In the two and a half years from August 1, 1991 to December 31, 1993, some 12,400 IEMs were filed, involving a total investment of Rs 2,56,158 crore, but nearly 36 per cent of this investment was accounted for by just two states, Maharashtra and Gujarat. Bihar, on the other hand, would account for just 1.38 per cent of the total investment and only 0.61 per cent of the employment to be generated by these new industrial units. Similarly, West Bengal would attract only 2.77 per cent of investment and 4.13 per cent of employment. According to the latest Annual Survey of Industries for 1989-90, West Bengal's share in total factory employment and fixed capital stock was 9.9 per cent and 7.1 per cent, respectively, and that of Bihar 4.9 per cent and 6.8 per cent. The share of these states in industrial production and employment is thus already disproportionately low. With incremental growth in these states being so minuscule, the adverse implications of the emerging industrial investment and growth patterns for the development of the different states and regions can be easily imagined.

AYODHYA

Path of No Return

NOTHING shows the duplicity of the Rao government better than the written statement it submitted to the Supreme Court on September 18, wherein it said, on the one hand, that if the court found that "no Hindu temple/structure existed" at the site of the Babri masjid "prior to the construction of the demolished structure", then the "government action will be in support of the wishes of the Muslim community", and, on the other hand, that if a Hindu temple/structure did exist there, then it would abide by the wishes of the Hindu community. The government made this statement in response to the court's injunction to it to clarify whether it would "rebuild the mosque in the event the court finds that no Hindu temple or religious structure was in existence there". The court was sitting to deliberate on the presidential reference made to it following the demolition of the Babri masjid at Ayodhya on December 6, 1992, namely, whether any Hindu temple or structure existed there prior to the construction of the Babri masjid.

Although the court has reserved its opinion on the reference for the moment and will make it known only in October, the statement by the government as well as the original reference to the court to give its opinion on the issue have put the court in a difficult situation. The court has been asked to take a position on an issue which is not an issue of law but of fact. However, the real difficulty lies in the fact that the opinion of the court has already been given a direction by the manner in which the reference has been constructed. In this construction, the non-existence of a temple over 440 years ago has impliedly been made the condition for the existence of a mosque now. In other words, in this particular construction of the reference the methodology for resolving the dispute—a methodology which is patently biased against the re-building of the demolished mosque at its original site—has already been put into practice; and the court has been left with little option but to give its opinion accordingly. The statement that the government submitted to the court in response to its query only compounds the matter even further, for it tells the court that to have the mosque re-built, you must say that no temple existed at the site more than 400 years ago.

Looked at in conjunction with the fact that the government allowed the implantation of the Ram idols at the site of the mosque within three weeks of the demolition of the Babri masjid and permitted their 'darshan', and that prime minister Rao has been making efforts to get together a 'non-political' trust to build the temple, it shows that the government is pushing the resolution of the problem at Ayodhya in a particular direction--in which a temple may come up at the site of the demolished mosque—and that it is using the Supreme Court to smoothen the way to achieve this end. For if the court says that a temple indeed existed at the site of the demolished mosque, then it can promptly go ahead and build the temple. However, if the court comes up with the contrary opinion, it can conveniently ignore it as mere advice.

DEVELOPMENT CAMPAIGNS

Feeble Impact

IT is exactly a year ago that Latur in Maharashtra was hit by a devastating earthquake. The fate of the survivors is almost forgotten. Recent reports from the area however indicate some disturbing developments, threatening particularly the position of women in Latur society. First, there appears to have been a spate of remarriages among the menfolk, the reasons being the death of wives and children during the earthquake or physical disability of wives caused by the calamity which has rendered them incapable of conceiving. Incidentally, while widowers have remarried within six months of the earthquake, widows who had lost their husbands due to the disaster are yet to be accepted as wives by the men in Latur. As usual, dowry has become an important factor, with the men demanding exorbitant amounts from the parents of their would-be brides.

Secondly, women who had undergone tubectomy before they lost their children in the earthquake are now being forced by their husbands to go in for the rejoining of the fallopian tube—a risky operation with 50 per cent chances of revival of the

child-bearing capacity In spite of official orders to avoid such operations, private doctors are having a field day by experimenting on the unfortunate women Evidently, during the family planning campaign in Latur earlier, very few men had opted for vasectomy, as apparent from the present tendency to force the women to undergo a reversal

The events in Latur have important implications for those engaged in campaigns for human resources development It may be recalled that Latur was one of the districts where the government's Total Literacy Campaign (TLC) was reported to have made 80 per cent of its population functionally literate and to have empowered women and the weaker sections of society in a big way Health awareness, women's rights anti dowry laws among other issues featured prominently in the motivational campaign (that was carried on for months before the launching of the literacy centres) and in the lessons that were imparted to the learners for almost a year In spite of all this have these neo literate men and women been able to break out of the historically structured social constraints? Apparently not, as evident from what is happening there now Deeply entrenched patriarchal social norms have reasserted themselves in the wake of the socio-economic trauma generated by the earthquake

It must be recognised that development campaigns in our society like the National Literacy Mission however well meaning they might be can at best knock feebly at the oppressive socio economic structures which are not only left intact but are nourished by the state In Latur while the unlettered were surely taught to read and write and made aware of the need for social changes the traditional socio-economic environment was allowed to continue thus making it difficult for these neo literates to change themselves according to the new values that were conveyed to them through the lessons in the literacy centres The sahukars and the village patriarchs the contractors and the private doctors remained the dominating forces in rural society It is these forces which dictate social norms in moments of crisis and are today deter mining the decision making process among the survivors of the Latur earthquake

As long as developmental activities like literacy campaigns remain divorced from sincere attempts to overhaul these various dominating socio-economic structures, every crisis—whether natural or man made—will wipe out at one stroke whatever gains such campaigns might have achieved in terms of generating social awareness While in Latur the crisis was sparked off by an earthquake in 1993 in the previous year some other districts under the Total Literacy Campaign faced a man-made crisis—communal riots following the demolition of the Babri masjid Messages of communal harmony and scientific inquiry which were spread through literacy lessons in these districts appeared to have had little effect on the learners who in those turbulent days seemed to have been more swayed by the hate-filled 'lessons' that were being doled out to them by the leaders of the traditional religious structures and the influential political establishments

ARMS TRADE

Vicious Circles

THE international trade in armaments which leaves a globe circling trail of destruction often results in incongruous connections What for instance, are the sources of the arms and ammunition with which the Afghan and Kashmiri rebels are fighting? While we are all aware of US and Pakistani arms supplies to many of us it may come as a surprise to know that among other countries in the business are the erstwhile Soviet Union and yes India

Recent publications coming out from the west (notably Christopher Smith's *The Diffusion of Small Arms and Light Weapons in Pakistan and Northern India* and *The Bear Trap Afghanistan's Untold Story* by Muhammed Yousaf and Mark Adkin) reveal how weapons often boomerang on the original manufacturing nations In order to hide its support for the mujahidin in Afghanistan during the early years the CIA resorted to indirect ways to supply them with weaponry It thus obtained from Israel a large consignment of Soviet weapons that were captured by Israel during its invasion of Lebanon Ironically again some 100 000 Enfield 303 rifles were purchased from India, also through indirect routes Between 1983 and 1987 all these weapons landed up in Afghanistan—via Pakistan which was the main conduit for the US arms supply to the anti-Soviet mujahidin The massive arms transfer to Afghanistan by the US during this period (procured from as diverse sources as China and Turkey and Egypt apart from the Soviet and Indian weapons mentioned earlier) meant that the Afghan mujahidin fought the Soviet troops often with Soviet manufactured arms Since much of the weaponry from the Afghan mujahidin arsenal has flowed into Kashmir it is quite likely that the Kashmiri militants are fighting the Indian security forces with Enfield 303 rifles—which had first found their way into the hands of the Afghan mujahidin

But there are more ironical instances of the Indian authorities being hoist with their own petard In November 1992, for example two consignments of weapons were smuggled through the Ajnala sector of Punjab to the north of Amritsar, to Sikh Khalistani groups there, with the help of those who are supposed to protect our borders—the personnel of the Border Security Force Similarly, in Kashmir, there have been instances of Indian security forces becoming involved in the weapons trade with militants In 1991, when a top Kashmiri militant, Master Innayat, was killed in an alleged encounter with the security forces, it was initially reported that he was carrying 67 rifles for transporting them from Baramulla to Srinagar But later the same security forces reported seizing only 29 rifles According to unofficial sources the rest of the initially seized consignment was sold back by the security forces to the militants within 12 hours One should not be surprised if the temptation for a quick buck prevails over the official oath to a fast-eroding concept of patriotic duty when one remembers that the weapons (sophisticated assault rifles in particular) seized by our security forces from the Khalistani and Kashmiri militants fetch anything between $ 575 and $ 2 700 in the arms bazaar

The Human Rights Watch Arms Project report (by the US based NGO) which has cited the above cases of Indian complicity both indirect and direct in the proliferation of destructive weaponry in the sub continent has primarily blamed the US for initiating the vicious circle of marketing deadly arms in this area Quite predictably the mainstream Indian press has lapped up this part of the report with one national English daily publishing selective excerpts from it under the three column heading US Rapped for Flow of Arms to J K Militants while ignoring conveniently a large part of the same report which is devoted to the atrocities committed by the Indian security forces in Punjab and Kashmir and the chapter titled Arming the Indian Government which exposes the surreptitious arms deals undertaken by New Delhi with east European countries and Israel As pointed out by the Human Rights Watch report these deals have enabled the Indian security forces to acquire assault rifles and other small arms and light weapons which have been used frequently by them in attacks on civilians in Kashmir and Punjab

The same report portions of which have been approvingly quoted by the Indian press makes an important recommendation which has been blacked out Referring to India's "rush to purchase large quantities of military hardware and technology, and its reliance on other governments for various forms of military support" the report suggests 'Potential suppliers [of arms] should pay close attention to the government's record in Kashmir and Punjab, since it is in these states that government forces have committed some of the worst and most regular violations of human rights "

Cochin Refineries Balmer Lawrie

PROMOTED jointly by Cochin Refineries and Balmer Lawrie and Company, Cochin Refineries Balmer Lawrie was incorporated with the objective of setting up a refinery downstream petrochemicals with imported technology The company's first project, viz, manufacture of polyisobutylene which has been set up at Ambalamugal (Tamil Nadu) in technical collaboration with US Chevron Research and Technology Corporation with a built in capacity of 7,000 tonnes per annum was recently commissioned and has commenced commercial production Polyisobutylene, has wide usage in the manufacture of additives for lubricating oils in 2-T oil formulations for two wheelers, in the manufacture of jelly filled cables and many other industrial applications finds its way into industries like petrol tube and telecom which are growing industries It also has a high export potential to the south east Asian and European markets

The company is entering the capital market on September 26 with a public issue of 49 99 990 equity shares of Rs 10 each for cash at a premium of Rs 25 per share aggregating Rs 17 50 crore The company has firm allotment to Indian mutual funds foreign institutional investors (FIIs) and non-resident Indians (NRIs) This project has been set up at a capital cost of Rs 45 crore and has been appraised by SBI Capital Markets The company is being promoted by reputed companies and its technical collaboration with world renowned corporation gives it an extra edge The issue is lead managed by SBI Capital Markets and ANZ Grindlays Bank

Bhuvan Tripura Industries

Bhuvan Tripura Industries (BTIL) an Ahmedabad based company is setting up a speciality chemicals project at Nandesari industrial estate Baroda with a total capacity of 4,050 MTPA at a cost of Rs 19 9 crore The BTIL group has also set up a 100 per cent EOU software project in Bangalore International Comptech Engineering Services (ICES), and which had recently come out with a public issue The company proposes to manufacture a water soluble polymer hydroxy ethyl cellulose which finds wide application in the manufacture of paints, oil exploration pharmaceuticals, plastics and chemicals as well as personal care products BTIL also proposes to produce an import substitute product, speciality alkanol amines having its main application in drug and dye intermediates, textile auxiliaries, corrosion inhibitors, in paints and coatings, and as for water treatment Development of expertise and technology is being done through in-house R and D with close co-operation with Shree Chem Research Lab of Bombay The company through its R and D has attained specialisation in high pressure vapour phase reactions in developing unique catalyst and in esta blishing cost-effective hi-tech processes The company claims that its project is in an advanced stage of implementation and production is likely to commence by April 1995, for the first phase The company proposes to enter the capital market shortly to part finance the project

Lloyd Electric and Engineering

Lloyd Electric and Engineering is engaged in the manufacture of condensor coils and evaporator coils which are used as original equipment in window, package automotive and split air conditioners The company is embarking on a expansion cum-modernisation activity with a total cost Rs 13 45 crore In part finance this project the company is entering the capital market on October 5 with a public issue of 29 70,000 equity shares of Rs 10 each for cash at a premium of Rs 20 per share aggregating Rs 891 lakh The company is situated at Bhiwadi Alwar district in Rajasthan This project will enhance the company's production capacity five fold resulting in a six fold increase in its turnover Economies of scale is expected to help the company increase its profits The company has entered into an agreement with Fedders Lloyd Corporation to lift 40 per cent of the company's production It also has firm allotment to Taurus Mutual Fund Indian Liberalisation Fund (Mauritius) and Financial Horizons The company is promoted by Ashok Punj and Maya Rani Punj The issue is jointly managed by ITC Classic Finance and State Bank of Bikaner and Jaipur

Neelkanth Motels

Neelkanth Motels and Hotels a Baroda based company, has finalised technical collaboration and franchise agreement with Super 60 Motels SPAS, California, US This agreement ensures the international quality standards for its present and forthcoming ventures at Ankleshwar, Saputara and Mahableshwar in Maharashtra The company has achieved sales target of Rs 38 lakh In the span of three years the company projects a net sales of Rs 402 lakh and net profits of Rs 135 lakh The company is in the process of consolida ting its operations by taking over manage-ment of motel sites at Ankleshwar, Gujarat and through acquisition and development of Motel Projects at Saputara and Mahableshwar

Diamond Cables

Diamond Cables, had come out with its maiden issue on August 10 last year for part financing their expansion programme of manufacturing AAAC, ACSR conductors, PVC cables at village Vadala Taluka Savli, in Baroda Following the public issue the company has taken up the diversification programme to manufacture XLPE cables and FRLS cables up to 1 1 kva costing Rs 260 lakh The expansion project is being financed by Internal accruals and term assistance to the extent of Rs 100 lakh The company expects to start production of its expansion project by the first week of October 1994

The company has promoted Diamond Optical Fibre Cables an integrated telecom cables project for manufacturing optical fibre cables and jelly filled telephone cables costing Rs 50 crore The company has reported a sales of Rs 235 lakh and a profit after tax of Rs 34 lakh Subsequ ently the board of directors of the company have recommended a dividend of 7 5 per cent and have also recommended a Rights Issue in the ratio of 1 1 at a premium not exceeding Rs 10 to the existing share holders of the company subject to neces sary approvals

The macro economic scene is characterised by (i) moderation of the inflation rate (ii) persistence of high liquidity growth contributed essentially by foreign exchange accruals (iii) acceleration in the average rate of industrial growth following bank credit linked demand expansion in automobiles and a few other industries (iv) some reaction to the historical peak of the previous week in equity prices and (v) considerable deceleration in export growth accompanied by a pick up in non POL imports Whether measured by the all commodities index or the index for food articles the moderation of the rate of price rise this year is partly statistical as it is over the very high base of the previous year

HINDUSTAN LEVER

Profitable Growth

HINDUSTAN LEVER (HLL) a subsidiary of Unilever has continued to make strides as a consumer product giant in India, with the company's performance getting augmented in the second half of 1993 when revival of consumer demand which was linked to yet another good monsoon began to pick up. The company's net sales have shown an increase of 16 per cent in 1993 with operating profit going up by 25 per cent and net profits by 29 per cent. In a situation of competition HLL has hiked its commission on sales which is reflected in its expenditure on sales jumping by 44 per cent for the year under review. A decrease in the company's interest burden was offset by increases in depreciation and tax provisions. The company has announced a dividend of 56 per cent for the year raising it from 42 per cent in the previous year. What is impressive is the HLL's ability to generate probably the best of the Indian corporate sector's profitability ratios: 23 per cent of return on investment (gross profit to total assets) or 33 per cent of return on equity capital (profit after tax on net worth). The company's sales to total assets ratio increased marginally by 2 percentage points while its sales to gross fixed asset ratio went up by 96 percentage points from 469 per cent in 1992 to 565 per cent in 1993.

HLL's exports remained low during 1993 for a variety of reasons like continued recession in the European and Japanese markets, with the North American markets' pace of recovery being very slow and the Indian rupee appreciating somewhat in real terms against the US dollar and the major European currencies. However taking a longer term view the company plans to invest over Rs 50 crore in export projects. The speciality leather tanning unit at Marungur Neyveli in Tamil Nadu is almost ready. The company's surimi fish paste project at Chorwad Veraval in Gujarat, particularly aimed at the Japanese market is under construction. HLL has also recently commissioned a rice milling plant at Kandla Gujarat with a complete integrated unit supplied by a Japanese firm which happens to be only one of its kind in Asia.

The company has obtained the ISO 9002 certification for its cosmetics and toilet preparation factory at Kandla and for its detergent factory at Mangalore. This was the first detergent factory and HLL the first company in the consumer product industry in India to receive this credit. In May 1993 the company took over the marketing department from Ponds. Under the umbrella of Unilever Brooke Bond Lipton India merged with Lipton India, Doom Dooma India Tea Estates India and Kissan Products and also succeeded in acquiring Dollops' business from Cadbury India. HLL's proposed merger with TOMCO has run into problems amongst other things with a case being filed against the merger with the MRTP Commission by the employees' unions of its own Sewri factory and the Federation of TOMCO employees, contending that the proposed amalgamation amounted to restrictive and monopolistic trade practices. However, HLL states that subject to the court and statutory approvals, the scheme of amalgamation would be effective from April 1 1993. In anticipation, the authorised capital of HLL has been raised from Rs 140 crore to Rs 150 crore. Also there was a preferential allotment of 29 84,347 equity shares of Rs 10 each to Unilever so as to increase the parent company's shareholding to 51 per cent. HLL has been able to borrow from the market at unduly low rates of interest due to better credit ratings through commercial paper (CP) and fixed deposits. The company continues to enjoy the best credit ratings of P1+ for its CP and FAAA for its fixed deposits. The company conducted a CP programme of Rs 45 crore during 1993 and the company's public deposits stood at Rs 55 36 crore as at the end of December 1993. The company's local R and D has strong linkages with the R and D facilities of Unilever in other parts of the world. The company invested Rs 8 crore in R and D in 1993.

The company's wholly owned subsidiary Indexport Limited has shown good performance for the year 1993. The company proposes to enter into a joint venture with Kimberly Clark of the US, the leading manufacturers in diapers and other household paper products. The shareholding of this joint venture would be 50 per cent each.

CENTURY ENKA

Poor Sales

Century Enka, a B K Birla group company has registered a decline in sales by 1 7 per cent for the year 1993 94. While the company's other income has gone up by 10 per cent, its operating profit and net profits have gone up by 38 per cent and 142 per cent respectively following a 25 per cent reduction in interest burden; however this has been offset to an extent by increased depreciation and taxation provisions. The company's retained profits have gone up by Rs 12 crore for the year under review as against a small absolute fall last year. The company has announced a dividend of 48 per cent for the year 1993 94. There has been a steady decline in the company's export earnings from Rs 10 96 crore in 1991-92 to Rs 2 78 crore in 1992-93 and further to less than Rs 1 crore in 1993 94. Simultaneously, its imports have also declined from Rs 48 23 crore to Rs 33 50 crore and Rs 28 03 crore, respectively, though the size of imports in relation to raw material consumed has remained high.

The reduction in excise duties on polyester and nylon filament yarns and in import duties of raw materials by the government coupled with improved law and order situation in the textile production centres have improved the demand for textile yarns. The continued recession in the automobile sector, and the import of tyre yarns and tyre cord fabrics against export entitlements have hit the company's nylon industrial yarn and tyre cord fabrics business adversely. The company claims to have enhanced its gross profit on sales (though its net sales remained low) through reduced operating costs. The company has taken various steps under its expansion, modernisation and diversification programme. The expansion scheme with technological upgradation of polyester filament yarn plant at Mahad has been finalised.

The company is now one of the promoters of Rajashree Polyfil (RPL) with 25 per cent equity participation. RPL is putting up a plant in Gujarat for the production of polyester chips and polyester filament yarns and the technical collaborators are to be the German Zimmer AG. Production is expected to commence by the middle of 1996. The company is also promoting Centak Chemicals which manufactures polymerisation initiators with a 19 per cent equity participation. The company's unit at Pune has declared an indefinite lockout following disputes with Pune Zilla Kamgar Sangh, the company's trade union.

ARVIND MILLS

Denims on the Move

The Lalbhai Group flagship Arvind Mills (AML) has performed well for the year 1993 94 with the company's net sales going up by 38 per cent as against the 21 per cent rise in 1992 93. The company's operating profit and net profit have gone up by 44 per cent and 67 per cent respectively. Many factors have contributed to a buoyancy in profits: a notable increase in non operating surplus (by Rs 29 crore), a four fold increase in 'other income' coupled with considerably reduced interest burden and practically nil provision for taxation. There has, no doubt, been some increase in depreciation provision. The company's debt equity ratio has come down to 49 per cent this year as against 196 per cent last year but short-term bank borrowings have registered some rise. The company's sales to gross fixed assets also remained high at 97 per cent for the year. Another remarkable feature about Arvind Mills has been its reduction in imports by 48 per cent while its exports went up by 68 per cent during 1993-94.

The company had undertaken a project for the creation of additional capacity for the manufacturing of indigo dyed denim for the domestic market in 1992 93 which has been partially implemented The company has been undertaking large investments as part of its expansion plans The company plans to expand its denim manufacturing capacity by 8 5 million metres per annum which is to be marketed domestically The company plans to set up a composite mill for the production of 12 million metres of high quality shirting fabrics annually to be marketed domestically as well as internationally The company has entered into a technical agreement with Germany's Lauffenmuhle for producing high quality denim though the formalisation of this agreement will be done after receiving government's permission

The company has established a wholly owned subsidiary in Sri Lanka Arvind Overseas The subsidiary is to produce denim at the rate of 8 5 million metres of denim fabric per annum which will be marketed in Sri Lanka and the US Arvind Mills plans to set up another subsidiary in Mauritius The company in a bid to penetrate the European market is tying up with the German Lauffenmuhle's Big Mill GmbH The company has decided to sell its drug unit in Bombay Earlier in 1982 Arvind Mills had acquired Indo Pharma Pharmaceuticals and was selling it under the company's own aegis The company also plans to merge the Ahmedabad based Asoka Mills (a sick unit) with it The company's wholly owned subsidiaries are Asman Investments Arvind Products Arvind Clothing Arvind Worldwide and Arvind Worldwide (M) The company has been entering into technical collaborations and trying to absorb the new technical know how through its own R and D The company incurred an expenditure of 20 lakh on R and D for the year

DCL POLYESTERS

Stamp of Quality

DCL Polyesters the Hyderabad based company engaged in the manufacture of man made fibres, registered an increase in the net sales by 9 per cent for the year 1993-94 but its operating profits have gone up by 36 per cent and net profits by a whopping 447 per cent The company has declared a dividend of 15 per cent as against 12 per cent in the previous year It is the reductions in interest burden and depreciation provisions by 24 per cent and 45 per cent, respectively, that have bolstered DCL's profitability The company has not made any provision for taxation for the past three years There has occurred a sharp fall in the company's debt equity ratio The company's performance in sales had not been good and some increase that took place in 1993-94 has been due to the recovery in demand that the industry began experiencing following by a cut in excise duty in the 1993-94 budget for the industry, the latter is reflected in a steady fall in excise duty burden on the company's products from Rs 180 43 crore in 1991-92 to Rs 163 44 crore and to Rs 152 39 crore in 1993-94

The company obtained the ISO 9002 certificate which will help it boost exports to the European market The company has obtained the government consent to expand its spinning capacity by 42 per cent (12,000 TPA) whereby its polycondensation plant will be optimally utilised This expansion scheme will help the company to add four spinning lines and to produce micro denier yarn in two lines which has a potential market both domestically and internationally The project is to commence by the end of 1994 To part finance this scheme the company had come out with a rights and preferential equity issue in January 1994 Also DCL plans to come out with an euro GDR issue up to US $ 100 million to part finance its project for the production of polyester filament yarn (PFY) and polyester staple fibre (PSF) with an annual capacity of 63,000 tonnes of polymer—a project that would cost Rs 508 crore and to be commissioned in 1996 The company also plans to set up a 25 000 tonne per annum (TPA) plant for production of purified terephthalic acid (PTA) The company's R and D department has been making successful efforts in absorption, adaptation and innovation of the technology obtained and has tied up with known specialists The company has obtained process know how technology from EMS Inventa AG Switzerland for the manufacture of partially oriented yarn (POY)

BIRLA JUTE

Sluggish Demand

Birla Jute a company with a net turnover of about Rs 660 crore, has shown a mixed performance with its sales increasing by 21 per cent and net profit going up by 35 per cent accompanied by operating profits increasing only marginally by 2 per cent and gross profit actually declining by 17 per cent the latter the company justifies as due to the ongoing depression in the cement carbide and ferro alloy prices throughout the year coupled with the sluggish demand of Linoleum and Vinoleum products Saving on interest burden and reduced depreciation provision and with a massive reduction in tax provision have helped the company to post a rise in net profits with the other income also going up by about 16 per cent The company has maintained its dividend at 25 per cent

The company has been granted the PR1+, the highest credit rating for the issue of commercial paper The company now intends to issue CP for an amount aggregating Rs 25 crore The company claims that all its three cement divisions viz, at Satna, Durgapur and Chittor have done well recording a growth of 22 per cent both in production and despatches despite the severe competition and recession by the industry Birla Jute plans to expand its cement capacity by one million tonnes each at its Satna and Chittor plants

The company's jute mills have also registered a 11 per cent growth in production and a 31 per cent growth in sales during 1993-94 The jute industry had to face a shortage of raw materials due to poor jute crop thus pushing the prices high Bally Jute Mill a major jute division of the company, which had faced a closure was reopened in August 1993 With the commissioning of sophisticated export yarn unit and high value fabric unit, the Bally Jute Mills is expected to contribute better profits for the company's family of jute divisions As a follow-up of its diversification plans for the non conventional use of jute fibre for the forward integration of the company's intermediate products and for increased value addition, Birla Jute has collaborated with Germany's EMPR WERKE for the manufacture of automobile interior door panels based on jute fibre Maruti Udyog has selected these jute fibre based door panels for their Zen and Alto models and accordingly a memorandum of understanding (MOU) has been signed under which Birla Jute will develop and supply the same The company's synthetic division has also registered a 4 per cent growth in production and 13 per cent growth in sales Modernisation and technological upgradation has resulted in an 108 per cent increase in exports in 1993 94 The company's carbide division's production suffered due to the breakdown of a furnace In an intensified effort to improve the quality of linoleum technical assistance of a German linoleum manufacturer is being sought The company has done well on the export front with its exports rising by 41 per cent as compared to the previous year Assam Jute Supply with a turnover of about Rs 10 crore is the Birla Jute's subsidiary

FEDERAL EXPRESS

Fast and Massive Courier

Federal Express, the world's largest express transportation company and the international partner of Blue Dart Express, received the prestigious ISO 9001 registration for all of it's worldwide operations, making it the first global express transportation company to receive comprehensive and system-wide certification available through the ISO 9000 series system Federal Express also enjoys the distinction of being the first to be awarded the Malcolm Baldrige National Quality Award in the service category in 1990 The company enjoys a large business of delivering more than two million items in 188 countries each working day with 102,000 persons employed by it and operating a 464 aircraft and more than 31,000 vehicles in its integrated system The company reported revenues of $ 8 5 billion for its fiscal year ended on May 31, 1994

Film Censorship and Freedom

A G Noorani

Partly as a genuine reaction to the abuse of freedom for mercenary ends but largely as a manoeuvre which exploits the abuse for political ends, moves are afoot in New Delhi to curb the freedom of the film-maker. But there is no sign of any united effort to awaken the public to the dangers inherent in the government's plan.

THE noted film-maker, Shyam Benegal, spoke not a day too soon when, on September 17 in Calcutta, he attacked the Central Board for Film Certification for its consistent lack of cinematic sensibility, aesthetics and creativity. He was delivering the first Satyajit Ray memorial lecture presided over by Mrinal Sen. Benegal remarked that film censorship is "a cat-and-mouse game"—film-makers testing the censors to find out how much is too much. He was objective about the state of the popular cinema today—a frenetic melange of sensationalism in which sex and violence play a major part. The audience has become a willing participant in the manipulations of the makers of such films. "If good cinema is rejected today, it means rationality is rejected."

Benegal is right when he says that education is the only remedy. That holds good for the long term. But the immediate danger should not be overlooked. The frenetic melange of sex and violence can be combated in the press especially by reputed film critics. They need not be mere criticism but denunciation. That is part of democratic debate.

However another danger faces us. Partly as a genuine reaction to the abuse of freedom for mercenary ends but largely as a manoeuvre which exploits the abuse for political ends, moves are afoot in New Delhi to curb the freedom of the film-maker. But there is no sign of any united effort whether by film-makers or civil libertarians to awaken the public to the menace before the government's plans are finalised.

Responsible correspondents have revealed in detail precisely what is afoot. Usha Rai of *Indian Express* reported in July that "the new guidelines (under discussion) for film producers seek not only to eliminate vulgarity and violence in films *but the denigration of ministers*, police officers and others holding public office as well". The politician who attacks vulgarity in films uses the opportunity to ensure that his own vulgarities and worse are protected from public censure.

In October 1994 the Censor Board will be revamped and its chairman, Shakti Samanta, completes his term. The new guidelines were discussed by the regional officers attached to the Board of Censors at Bangalore. Its members were asked to send their reactions to the ministry of information and broadcasting. The guidelines were last revised in December 1991.

Around the same time Hasan Suroor of *The Hindu* (July 21) also reported these plans: "Is correct political censorship of films round the corner? This is the question doing the rounds of film circles following reports that among the proposals being discussed by the Censor Board to tighten censorship rules there is one that seeks to ban unflattering references to politicians and the police. ...If the proposal is finally accepted, films portraying politicians and senior police officers as anti-national or corrupt would have a difficult time getting the nod from the censors. And considering that corrupt politicians and police officers are as much a staple diet of both mainstream and parallel cinema as are sex and violence, film-making would either come to a halt or have to find a radically new expression, completely divorced from real life." The new guidelines to be sure, have the government's backing. It is only a matter of time before they are promulgated.

But that is not all. Also in the offing are plans for pre-precensorship of films as *The Hindu* reported on August 20. Film-makers will be "asked to submit a detailed script to the Censor Board even before they start shooting". Is this film censorship or literary censorship? Is there *any* country in the democratic world where such nonsense will even be contemplated? This exercise will be called 'pre-censorship advice'. But, of course, it would be in the 'interests' of film producers, as the minister of state for information and broadcasting K P Singh Deo told the Lok Sabha "This would be purely on an informal basis and without any binding on the producers *or the Board.*" So, what is the worth of the exercise? Apparently, even if the film producers dutifully carries out the cuts suggested by the Board after examining the script, there is no guarantee that the film will pass muster with the Board. Not only the dialogue but even the lyrics are to be "cleared by the Board before they are recorded".

This is a sure way to alert politically inconvenient films *quietly without the embarrassment of brutal cuts or refusal of certification.* Clearly the government of India "is closing in on political cinema" as the correspondent rightly summed up the motive behind the moves. The Supreme Court has ruled repeatedly that the fundamental right to freedom of speech and expression applies to films as well as T V. Only 'reasonable' restrictions can be imposed on the exercise of that right and then, too, only on any of the grounds specified in article 19(2) of the Constitution, for example, "public order, decency or morality... defamation or incitement to an offence". None of the curbs contemplated in respect of depiction of the misdeeds of politicians or the police fall within these categories. Some film-makers are under a handicap. They cannot go to court and annoy the government lest it withhold its patronage. This is the net result of inviting ministers to inaugurate film functions. The Indian state has acquired stranglehold over the country's arts and artists.

RESERVE BANK OF INDIA SERVICES BOARD, BOMBAY

Advt No 1/94-95

Telegraphic Address 'SERVBOARD' BOMBAY

Applications (Apps) are invited for following posts of Officers in Reserve Bank of India (RBI/Bank)

Sr. No.	Name of the post	No of posts	Reservation		
			Scheduled Castes (SC)	Scheduled Tribes (ST)	Other Backward Classes (O)
A.	Legal Officer in Gr.'B' in Legal Department	4	-	1	1
B.	Research Officer in Gr.'B' in Department of Statistical Analysis and Computer Services (DESACS)	14	2	1	4
C.	Research Officer in Gr. 'B' in Department of Economic Analysis and Policy (DEAP)	12	2	1	3
D.	Assistant Executive Engineer in Gr. 'B' (Civil)	4	1	-	1
E.	Assistant Executive Engineer in Gr. 'B' (Electrical)	3	-	-	1
F.	Assistant Engineer in Gr 'A' (Civil)	6	1	1	2
G.	Assistant Engineer in Gr. 'A' (Electrical)	1	-	-	-
H.	Security Officer in Gr. 'A'	10	1	1	3

Reserve lists may also be prepared

Note Reservation of 27% is provided in favour of OBC category However, no concession in matter of age, educational qualifications, examination fees or qualifying standards will be available to candidates belonging to this category

A. LEGAL OFFICER IN GR. 'B' IN LEGAL DEPARTMENT

a) Qualifications (As on 31.10.94)

Essential First Class Bachelor's Degree in Law from a recognised University / Institute or equivalent

Desirable Master's Degree in Law from a recognised University/ Institute or equivalent

b) Experience (As on 31.10.94)

Essential At least 2 years' experience as an Advocate or as a Law Officer in the Legal Department of a large Banking / Financial Institution and/or as a Lawyer in an Advocate's / Solicitor's Office

Desirable Special knowledge of Banking and Company Laws, Labour Laws, Constitutional Law and experience in documentation

c) Age Limit (As on 1.9.94)

Not exceeding 32 years (i e candidate must have been born not earlier than 2nd September 1962) Upper age limit is relaxable by 3 years in case of candidate possessing exceptional qualifications and / or experience of value to the Bank (Refer item J of detailed advertisement for age relaxation for specified categories)

d) Scheme of Selection

Written Examination will be held on **Sunday, the 4th December 1994** consisting of the following 2 descriptive type papers

	Duration (in hours)	Max. Marks
Paper I - General Knowledge of Law Jurisprudence, etc	3	100
Paper II - Commercial and Banking Laws	3	100
Total		200

Questions will be set to assess candidates general knowledge of Law and in particular Commercial Law, Banking Laws and Jurisprudence and their ability to apply legal principles to deal with problems in finance and banking (Refer detailed advertisement for Syllabus)

B. RESEARCH OFFICER IN GR. 'B' IN DESACS

a) Qualifications (As on 31.10.94)

Essential (i) Master's Degree in Statistics / Mathematical Statistics / Mathematical Economics / Econometrics from a recognised Indian or Foreign University / Institute with a minimum of 55% marks or equivalent grade, OR

ii) Master's Degree in Mathematics from a recognised Indian or Foreign University / Institute with a minimum of 55% marks or equivalent grade and one year Post-Graduate Diploma in Statistics or related subjects from an Institute of repute, OR

iii) M Stat Degree of Indian Statistical Institute with a minimum of 55% marks

For SC / ST candidate, Master's Degree as in items (i) (ii) and (iii) with a minimum of 50% marks or equivalent grade

Desirable (i) Candidate with a Doctorate in Statistics /Mathematical Statistics / Mathematical Economics /Econometrics from a recognised Indian or Foreign University / Institute will be given preference

(ii) Research or teaching experience and publication in standard journals will be considered as an additional qualification

b) Age Limit (As on 1.9.94)

Between 21 and 28 years (i e candidate must have been born not earlier than 2nd September 1966 and not later than 1st September 1973) (Refer item 'J' of detailed advertisement for age relaxation for specified categories)

i) Candidate having M Phil Degree or Doctorate Degree from a recognised Indian / Foreign University /Institute in the specified subjects will be eligible for relaxation in upper age limit by 3 and 5 years, respectively

ii) Candidate with research / teaching experience at a recognised Indian / Foreign University / Institute will be eligible for relaxation in upper age limit to the extent of number of years of such experience subject to a maximum of 5 years

However cumulative age relaxation will not be available if candidate is eligible under both the above categories as also under any other specified category mentioned in item 'J' of detailed advertisement

c) Scheme of Selection

Written Examination will be held on **Sunday, the 11th December 1994** consisting of the following papers

	Duration (in hours)	Max. Marks
Paper I - Objective Type	2	100
Paper II - Descriptive Type	2	100
Total		200

Syllabus

In both the papers questions would cover Mathematics, Statistics and Mathematical Economics (Standard of Papers would be that of Master's Degree examination of any Central University in India)

C. RESEARCH OFFICER IN GR. 'B' IN DEAP

a) Qualifications (As on 31.10.94)

Essential Master's Degree in Economics / Econometrics / Commerce from a recognised Indian or Foreign University / Institute with a minimum of 55% marks or equivalent grade

For SC / ST candidate, Master's Degree as above with a minimum of 50% marks or equivalent grade

(Continued on Page 2523)

(Continued from Page 2522)

Desirable: i) Candidate with Doctorate Degree in Economics / Econometrics / Commerce from a recognised Indian or Foreign University / Institute will be given preference.
ii) Research or teaching experience and publication in standard journals will be considered as an additional qualification.

b) Age Limit (As on 1.9.94)

Between 21 and 28 years (i.e. candidate must have been born not earlier than 2nd September 1966 and not later than 1st September 1973).
(Refer item 'J' of detailed advertisement for age relaxation for specified categories).
i) Candidate having M. Phil. Degree or Doctorate Degree from a recognised Indian / Foreign University / Institute in the specified subjects will be eligible for relaxation in upper age limit by 3 and 5 years, respectively.
ii) Candidate with research / teaching experience at a recognised Indian / Foreign University / Institute will be eligible for relaxation in upper age limit to the extent of number of years of such experience subject to a maximum of 5 years.

However, cumulative age relaxation will not be available if candidate is eligible under both the above categories as also under any other specified category mentioned in item 'J' of detailed advertisement

c) Scheme of Selection

Written Examination will be held on **Sunday, the 18th December 1994** consisting of the following papers

	Duration (in hours)	Max. Marks
Paper I - Objective Type	3	100
Paper II - Descriptive Type	3	100
	Total	200

Syllabus

Standard of both the papers would be that of Master's Degree Examination in Economics of any Central University in India

D. ASSISTANT EXECUTIVE ENGINEER IN GR.'B' (CIVIL)

a) Essential Qualifications and Experience (As on 31.10.94)

i) Bachelor's Degree in Civil Engineering or equivalent qualification from a recognised University / Institute with a minimum of 60% marks or equivalent grade
ii) At least 3 years' experience after graduation (of which at least one year shall be in a position of independent responsibility equivalent to that of Asst. Engineer) in a large organisation (preferably public sector) in planning /designing / construction / maintenance of large office building / housing projects including services and preparation and evaluation of tender papers

b) Desirable Experience / Qualifications

i) Specialisation in structural design, soilmechanics, public health engineering
ii) Experience of administering construction projects in all its various aspects and knowledge of PERT/CPM techniques.
iii) Working knowledge of computers with particular reference to analysis and evaluation of tenders / CAD / CAM and structural design
iv) Working knowledge of maintenance of electrical and electromechanical services.

c) Age Limit (as on 1.9.94)

Not above 35 years (i.e. candidate must have been born not earlier than 2nd September 1959) (Refer item 'J' of detailed advertisement for age relaxation for specified categories).

d) Scheme of Selection

Written Examination will be held on **Sunday, the 25th December 1994** and will consist of both Objective and Descriptive Type Papers as follows :

	Duration (in hours)	Max. Marks
Paper I - Objective Type Test of professional knowledge / job knowledge (Civil / Electrical*)	Details alongwith admission letter	100
Paper II - Descriptive Type Both the papers will cover syllabus of relevant Engineering disciplines viz. Civil / Electrical. Standard of the papers will be that of Bachelor's Degree Examination in Engineering (Civil / Electrical*) of an Indian University.	3	100
* Applicable to Electrical Engineer's post	Total	200

E. ASSISTANT EXECUTIVE ENGINEER IN GR.'B' (ELECTRICAL)

a) Essential Qualifications and Experience (As on 31.10.94)

i) Bachelor's Degree in Electrical Engineering or an equivalent qualification from a recognised University / Institute with a minimum of 60% marks or equivalent grade

ii) At least 3 years' experience after graduation (of which at least one year shall be in a position of independent responsibility equivalent to that of Asstt. Engineer) in a large organisation (preferably public sector) in planning /designing / execution of internal and external electrical installation work, large central air-conditioning plant, lift, communication system and / or other services involved in large modern and multi-storeyed building projects including preparation and evaluation of tender papers.

b) Desirable Experience / Qualifications

i) Working knowledge of electronics including both hardware and software aspects of micro-processor based mini and large computer system and electronic telephone exchange and communication systems
ii) Experience in maintenance of lifts, pumps, air-conditioning plants, etc
iii) Experience in administering construction projects in all its aspects and knowledge of PERT / CPM techniques.

c) Age Limit (as on 1.9.94)

Not above 35 years (i.e candidate must have been born not earlier than 2nd September 1959) (Refer item 'J' of detailed advertisement for age relaxation for specified categories).

d) Scheme of Selection

Written Examination will be held on **Sunday, the 25th December 1994** and will consist of both Objective and Descriptive Type Papers on the lines of item D (d) above

F. ASSISTANT ENGINEER IN GR.'A' (CIVIL)
AND
G. ASSISTANT ENGINEER IN GR.'A' (ELECTRICAL)

a) Qualifications (As on 31.10.94)

Bachelor's Degree in Civil Engineering / Electrical Engineering or an equivalent qualification from a recognised University / Institute with at least 60% marks or an equivalent grade

b) Age Limit (As on 1.9.94)

Not above 30 years (i e. candidate must have been born not earlier than 2nd September 1964) (Refer item 'J' of detailed advertisement for age relaxation for specified categories)

c) Scheme of Selection

Written Examination will be held on **Sunday, the 8th January 1995** and will consist of both Objective and Descriptive Type papers on the lines of item D (d) above.

H. SECURITY OFFICER IN GR. 'A'

a) Eligibility Criterion (As on 31.10.94)

An Officer with minimum 5 years Commissioned Service in the Army / Navy /Air force

b) Age Limit (As on 1.9.94)

Between 25 and 40 years (no relaxation for any category) (Candidate must have been born not earlier than 2nd September 1954 and not later than 1st September 1969)

c) Scheme of Selection

Selection by interview only. Board reserves the right to raise the minimum experience in order to restrict number ofcandidates to be called for interview commensurate with number of vacancies Decision of Board in this matter will be final and no correspondence will be entertained in this regard.
Application fees once paid will not be refunded even if candidate is prima facie eligible and not called for interview.

I. EXAMINATION/INTERVIEW - GENERAL INSTRUCTIONS

1. All candidates whose Apps. with prescribed fee (unless specifically

(Continued on Page 2524)

(Continued from Page 2523)

exempted) are received by the closing date will be admitted to Written Examination

2 Candidates applying for posts at B to G have to qualify in Objective and Descriptive Type papers separately Descriptive paper will be assessed only of such candidates who score in the Objective Test sufficiently high marks in order of merit Candidates for above posts as also for Legal Officer's post who score sufficiently high marks in order of merit on the basis of aggregate marks in Written Examination will be eligible to be called for interview merit for this purpose being decided by Board on the basis of the number of vacancies to be filled up Final selection will be on the basis of candidate s performance in Written Examination and Interview taken together

3 Question papers for Written Examination will be set in English and answers must be written in English

J. EXAMINATION CENTRES

Written Examinations will be held at the following centres The code numbers are in brackets

Ahmedabad (11) Bangalore (12) Bhopal (13) Bhubaneshwar (14) Bombay (15) Calcutta (16) Chandigarh (17) Guwahati (18) Hyderabad (19) Jaipur (20) Jammu (21) Kanpur (22) Madras (23) Nagpur (24) New Delhi (25) Patna (26) Trivandrum (29)

Candidate can select only one centre and must indicate centre and code number in the App Centres and dates of Written Examinations are liable to be changed at Board s discretion In the event of cancellation of Written Examination at any centre Board may at its discretion allot an alternative centre to the concerned candidates Candidate admitted to Written Examination will be intimated the date, time-table and venue of Written Examination by an Admission Letter (AL) Candidate to whom an AL has not been issued will not be admitted to Written Examination

Request for change in the centre will not be entertained

K. APPLICATION FEE

Rs 50/- (Rupees Fifty only) for each post payable separately No fee for SC / ST candidate Fee is payable by Demand Draft in favour of Reserve Bank of India payable at Bombay However candidate from unbanked areas may pay fee by crossed Indian Postal Order in favour of Reserve Bank of India payable at GPO Bombay Payment in any other manner will not be accepted Fee once paid whether in full / part / excess will not be refunded or held in reserve for any other examination / selection

L. SERVICE CONDITIONS / CAREER PROSPECTS

i) **PAY SCALE**

For Gr 'B' - Rs 2400-150-3600-175-4125-EB-175-5175

Depending upon the place of posting total initial monthly emoluments will vary between **Rs 5900/-** and **Rs 6000/-** at present

For Gr. 'A' - Rs 2225-150-3575-175-3925-EB 175-4800

Depending upon the place of posting total initial monthly emoluments will vary between **Rs 5550/-** and **Rs 5650/-** at present

In case of candidate possessing very high academic or professional qualifications / experience of significant value to Bank it may at its sole discretion consider granting additional increments (not exceeding four)

ii) The posts also carry benefits of contributory Provident Fund Pension Gratuity Leave Leave fare concession (with facility to encash leave) and Medical facilities etc

M. HOW TO APPLY

Those who satisfy eligibility norms may apply in specimen format given below duly completed in all respects and typed or neatly handwritten in Hindi / English on white foolscap paper (on one side only and approximately of 33 5 cms x 21 cms size) after affixing a recent passport size signed photograph on the App The App should be addressed to **The Secretary, Reserve Bank of India Services Board, Hongkong Bank Building, 6th floor, Mahatma Gandhi Road, Hutatma Chowk, Post Bag No. 10009, Bombay 400023.** The cover containing the App should be superscribed App for the post of * ______ "Centre"** ______ Code No ______ and sent by Ordinary post

* Name of the post applied for

** Centre for Written Examination chosen by the candidate

Those who intend to apply for more than one post must send separate App with separate fee for each post if payable A combined App or combined fee for more than one post will render the application invalid

N. CLOSING DATE

Completed App with enclosures must reach the Board's Office at Bombay on or before **31st October 1994 (14th November 1994** for applicants residing abroad in Ladakh Divn of J & K State Sikkim, Pangi Sub-Dvn of Chamba Lahaul and Spiti districts of Himachal Pradesh, States / Union Territories in the North Eastern region and in the Andaman and Nicobar Islands and Lakshadweep) Apps received after closing date will not be considered Candidates may drop their Apps in closed cover in the box specially kept for the purpose at Board's Office

Note The above posts are also open to staff candidates who satisfy the eligibility criteria separately laid down by Bank for them and who apply within the stipulated date

CANVASSING IN ANY FORM WILL BE A DISQUALIFICATION

FOR FURTHER DETAILS REGARDING ELIGIBILITY SCHEME OF SELECTION JOB REQUIREMENT SERVICE CONDITIONS, CAREER PROSPECTS RELAXATION IN UPPER AGE LIMIT, GENERAL INSTRUCTIONS ETC CANDIDATES SHOULD REFER TO DETAILED ADVERTISEMENT APPEARING IN **"EMPLOYMENT NEWS"** AND **"ROZGAR SAMACHAR"** DATED **1ST OCTOBER, 1994.**

FORMAT OF APPLICATION

RESERVE BANK OF INDIA SERVICES BOARD, BOMBAY

Advt No 1/94-95

Affix a signed copy of your recent passport size photograph 5 cms x 7 cms

New Drug Policy

Prescription for Mortgaging Drug Industry

Amit Sengupta

Once again the government has yielded to pressure from industry and moved towards easing control mechanisms for pharmaceuticals in the new drug policy The impact of the policy on the production of drugs and their prices should be assessed against the background of the government's earlier moves to progressively minimise controls

IN August 1992 the government (department of chemicals and petrochemicals, ministry of chemicals and fertilisers) circulated a note to members of parliament regarding proposed changes in the 1986 Drug Policy titled Background Note on Review of Drug Policy 1986 This started fuelling rumours about a new drug policy being on the anvil and the opportunity was used by the industry to focus on its demands for fewer controls and higher margins of profitability These basic demands were not new and have been raised by the industry from time to time In fact the argument that the present system of price and production controls are responsible for lower production of essential drugs, has been raised many times in the past

After more than two years the government has finalised the draft for a new policy and has clearly decided to go along with the demands of the industry The number of price controlled drugs is to be slashed from 142 to 73 Greater profitability will be allowed even in the price controlled category The number of drugs reserved for the public sector is to be further reduced Further 51 per cent foreign equity participation will be allowed automatically in all sectors of bulk drug production

One of the reasons identified, in the note for the need to review the 1986 policy is the fact that major changes have been made in the New Industrial Policy This is obviously not the place to resort to polemics regarding the advisability of India s structural adjustment programme But it needs to be emphasised that even developed market economy countries treat the drug industry differently from consumer goods industries Price and production control mechanisms are in place in all these countries except probably to an extent in the US Significantly, one of the main election planks of president Bill Clinton was the promise to bring a semblance of order in the US drug industry In the US today increasing concern is being expressed on the rampant increase in health care costs The World Bank in a recent document has also voiced fears "that in many third world countries structural adjustment programmes have been set in motion without having in place a 'safety net ' (i e, measures to protect the most needy from the vagaries of the market) for the poorest sections Is it not ironic that we wish to initiate changes which are under question in the same countries and by the same agencies at whose behest India s economic liberalisation programmes are being carried out?

In the past too especially since the 1978 Drug Policy the government has reacted to such demands of the industry by gradually easing control mechanisms Today when similar points are being raised earlier attempts at reducing controls merit a closer look At the same time it needs to be understood that the Indian drug industry is composed of a number of sectors—MNCs public sector Indian organised sector small scale sector etc—each with their own sectoral interests Hence the role played by various sectors at different points of time, would also be of interest

At the turn of this century the Indian drug industry was set up through the pioneering work of Indian scientists like Acharya P C Ray and T K Gajjar However the Indian market was soon taken over by multinational corporations, mostly of British origin All these companies merely acted as trading centres who imported drugs from their parent countries and little attempt was made to start production facilities in India This situation continued after independence and the Indian market continued to be dominated, overwhelmingly by MNCs With the advent of the antibiotic era these companies earned tremendous profits by over pricing their products In this period, the Indian government went shopping for technology to produce vital drugs indigenously to all the MNCs and western nations However, antibiotic production finally started indigenously when Hindustan Antibiotics was set up with help from the World Health Organisation (WHO) and the UNICEF in 1954 Subsequently, IDPL was set up with the help of Soviet technology in 1961

With the setting up of the Indian public sector, antibiotic prices came crashing down—in some cases by 60 to 70 per cent The MNCs, in order to survive in the Indian market, slashed their prices Interestingly, it was precisely in this period that they started production of bulk drugs in India for the first time (Table 1) In the 1960s, the Indian private sector also started growing Unlike the foreign sector, they also set up substantial capacities for indigenous production of bulk drugs However, the former, in view of their superior marketing network, managed to keep a stranglehold on the Indian market

It was against this background that the Hathi committee was appointed by the government in 1974 to undertake a thorough analysis of the Indian drug industry Though the committee submitted its report in 1975 it came to light only in 1977 The Hathi committee made some extremely important observations and recommendations Some of them would bear repetition here The Hathi committee Unequivocally decried the role played by MNCs in the industry attempted for the first time a formulation of an essential drug list recommended a gradual shift to generic names from brand names a package of price control measures to make life saving and essential drugs affordable production control measures to ensure production of essential drugs immediate dilution of foreign equity in drug firms to 40 per cent and progressively to 26 per cent In fact by a majority decision the Hathi committee recommended nationalisation of all foreign drug companies, a leading role for the public sector, and a sectoral reservation in the industry to encourage growth of the Indian sector The Hathi committee was sharply critical of the foreign sector because of its reluctance to produce bulk drugs in the country as well as its non-performance in producing essential drugs At the same time, it was noted that these firms were more interested in producing inessential drugs or those requiring low technological inputs

The Drug Policy of 1978 and the Drug Price Control Order (DPCO) 1979, were

IV (Decontrolled)	11 7	13 2	14 6

Source The Indian Pharmaceutical Industry—Problems and Prospects' by P L Narayana, NCAER

based, albeit partially, on recommendations of the Hathi committee. For the first time, comprehensive price control was introduced in the drug industry (though some price control measures had been in force since 1970) The new DPCO categorised drugs into four categories—I (life saving), II (essential), III (less essential) and IV (non-essential/simple remedies) Of these, the first three categories were price controlled with mark up (profits allowed) of 40 per cent, 55 per cent and 100 per cent respectively The philosophy behind this graded system of price control was to make more essential drugs cheaper While it is possible to fault, in some cases, the process of categorisation, an attempt was at least made to come up with a graded essential list of drugs The 1978 policy also reserved major areas in the market for different sections in the Indian sector—both private and public Further, it stipulated that the process of shift to generic names would be started with five drugs, analgin, ferrous sulphate, aspirin piperazine and chlorpromazine These measures led to a rapid growth of the Indian sector, which rapidly gained the capability of producing most essential drugs In fact, UNIDO, in 1980, identified India as one of the countries with capacity to produce all essential drugs indigenously

The foreign sector continued to produce principally in low technology areas and increased production of inessential drugs They showed little inclination towards increasing bulk drug production while increasing their production of formulations enormously In essence they continued to play the role of trading centres In fact, the small-scale sector was engaged in producing more bulk drugs than the whole foreign sector put together So much for the claim of MNCs that they bring in new technology There appears little justification in the continued presence of the MNCs if they are to produce vitamins, tonics, syrups and rubs and balms

In the aftermath of the 1978 Drug Policy, the organised Indian private sector created a solid base for itself in the drug industry Having done so, it joined the MNCs in the campaign for reversal of the 1978 policy Before going into that aspect, it would be interesting to recapitulate how loopholes in the 1978 policy were utilised to make large sections of the policy infructuous

A major lacuna in the 1978 policy was the lack of production control measures This was contrary to the Hathi committee recommendations But the 1978 policy had no clause to compel manufacturers to produce essential drugs This, when coupled with the graded pricing structure, proved to be disastrous. Companies reduced production in categories I and II, where the mark ups allowed were lower Table 1 illustrates this point

At the same time, the whole concept of sectoral reservation was diluted as the Hathi committee recommendation for equity dilution was ignored FERA companies, under the 1978 policy, were required to dilute their foreign equity to 40 per cent in order to be treated at par with Indian companies Most FERA companies readily complied, as it is always possible to control a company with 40 per cent block holding of shares, provided the other shares are widely dispersed This is precisely how equity dilution was done by most FERA companies Today, almost all major foreign firms like Glaxo, Hoechst, May & Baker, Parke Davis and so on are treated at par with Indian companies The shift to generic names was blocked by Hoechst, Cyanamid and Pfizer, which obtained orders from the Delhi High Court in 1981 The case is now pending with the Supreme Court and a final judgment is still awaited

During this period, the public sector came to be increasingly marginalised Due to bureaucratic and administrative bungling as well as rampant inefficiency and corruption, public sector units ran up huge losses and were in no position to play a leading role This was indeed unfortunate as a strong public sector could have been used to counter the arm-twisting tactics by the rest of the industry While lip-service

was paid to the questions of formulating an essential drug list and weeding out hazardous/irrational drugs, no significant progress was made

By the early 1980s, the industry, led by the MNCs, started making belligerent noises for reversal of the 1978 policy—for decreased controls The industry argued that drug production was becoming unprofitable and even proceeded to deliberately reduce production of essential drugs In this campaign, they were joined by large companies in the Indian private sector, which had by now consolidated their position in the industry The government gave in, first by delicensing a number of drugs This led to even greater anarchy of production and in fact actually led to decreased production in many vital areas

The 1986 policy, in one sweep, reduced the span of price control from 347 bulk drugs to 166 drugs It decreased the number of controlled categories to two and increased the mark up in these to 75 and 100 per cent This was in addition to various liberalisation measures initiated by the government from time to time The implementation of the DPCO of 1987, based on the 1986 policy, led to an immediate hike in drug prices Pious pronouncements that it would increase production of essential drugs were belied (Table 2)

If we look back at the various policy initiatives and their impact on essential drugs the following stand out

(1) A differential price control mechanism in the absence of production controls has led companies to shift production to non-essential areas where returns are higher

(2) Because of the proliferation of large number of formulations (an estimated 40,000 - 80,000) and drug manufacturers (an estimated 800-1,200) the government has consistently reduced the drugs under price control in order to make its task more 'manageable'

(3) The foreign sector has 'created' a market for many of its irrational and inessential branded products, and has chosen to concentrate on these low-technology areas

Some discussion on the product-mix of the Indian drug industry would be of use here While the Indian drug industry has grown considerably, a disturbing trend is discernible today Most manufacturers have today started vying for the up-market section of the Indian consumer who can pay heavily to 'buy' health care Thus the indifference shown by companies towards production of low cost essential drugs In doing so the industry is also in danger of falling into a self-destructive loop where 1,000 manufacturers fight for the market for drugs among 5 per cent of the population who can pay This need must act as a major constraint to further development of the industry. The question here is not of making production of essential drugs remunerative The issue is that the industry finds production in certain areas *more* remunerative But ultimately if 1,000 manufacturers continue to neglect 95 per cent of the market, the survival of the industry—or large parts of it—will be at stake

Further the issue of proliferation of irrational drugs has to be seen not only in the context of health needs but also in terms of the impact it has on the regulatory bodies Such proliferation makes it virtually impossible to impose price control mechanisms on all drugs The government and the industry argue that the way out is to keep most drugs outside price control A more rational solution is to restrict the kind of formulations that are to be allowed, so as to make controls for all drugs feasible

Are Drug Companies Incurring Losses?

In the new policy the government is set to grant major concessions to the industry in terms of reduced price and production controls As mentioned earlier such concessions shall include slashing down of the number of drugs under price control, an across the board increase in mark-up, increase in returns allowed for bulk drug manufacture and freedom to companies to automatically revise formulation prices without prior government approval All these four measures will lead to price escalation while, given the dynamics of the industry discussed earlier, none of them can in any way boost production of essential and life-saving drugs A proposal to automatically allow 51 per cent foreign equity participation has also being cleared and the number of drugs reserved for the public sector are also sought to be reduced—a further attempt at

emasculation of the public sector is thus to be set in motion. Thus all the positive points in our drug policy emanating from the Hathi committee are going to be reversed.

The basic plea from the industry (to which the new policy has reacted positively), is that the drug industry should be decontrolled—both with regard to production and pricing. To first address the issue of profitability Table 3 shows the profitability of top drug companies. Profits as well as turnover of drug companies have shown a large increase over the previous year and the companies are paying large dividends to shareholders. Drug companies have tried to obfuscate the issue by claiming that the ratio of profits to sales turnover is not adequate. To buttress their point they have tried to compare this ratio with that of certain other industries. This is a fraudulent argument as inter-industry comparisons of this kind are meaningless. The pharmaceutical industry is not a capital-intensive industry. The committee on Category II Drugs, 1987 says "compared to other industries, this is much less capital-intensive. ...capital invested for drugs and pharmaceutical industry... works out only Rs 94,000 per labour...in comparison in industries such as fertilisers, petrochemicals and synthetic fibres where capital invested per labour employed works out to Rs 61 lakh, Rs 38.9 lakh and Rs 24.1 lakh." Hence a relatively small capital investment can produce a large turnover. Even a comparison with other sectors of industry shows that both sales and profits have been growing at a faster rate in the pharmaceutical industry. And the ratio of gross profits to sales is near the all industry average. Table 4 shows performance in the top sectors of industry turnover of Rs 1,000 crore or over (half-yearly figures).

Another argument used by the industry is that drug costs account for a small percentage of health care costs and hence to reduce expenditure on health care other costs are more important, viz, doctors' fees, diagnostics, hospital expenses. While it is true that there is scope for reduction of health care expenses in other areas, Table 5 shows the actual position in regard to ratio of drug costs to total health care costs.

Table 6 gives us a sectoral overview of production patterns of bulk drugs. This study of 58 monitored bulk drugs shows the following: In the case of 14 drugs the main production is in small-scale sector and in one case the small-scale sector has a significant contribution. The top 20 MNCs which account for 31.5 per cent of the market share (source: *Indian Express*, March 30, 1993) have over 50 per cent share in eight drugs, over 25 per cent in four drugs and over 10 per cent in 5 drugs. Of the eight drugs in which it has major share one is totally inessential, Vitamin E, and one is hazardous, Baralgan. The top 20 Indian companies which

account for 31.5 per cent of the market share have over 50 per cent share in nine drugs and over 25 per cent share in three drugs. The public sector has over 50 per cent share in eight drugs, over 25 per cent in four drugs and over 10 per cent in two drugs. The Indian sector companies (not in top 20) have over 50 per cent share in 13 drugs, over 25 per cent in four drugs and over 10 per cent in three drugs. Thus 40 top companies, which account for 63 per cent of the formulation market share have over 50 per cent share in only 17 out of 58 drugs.

This clearly shows that larger companies are not interested in producing bulk drugs, but prefer to act as mere traders and middlemen by concentrating on the formulations market. In such a situation there can be no justification in liberalising production controls. In fact more stringent production controls are called for.

Increase in Prices on Anvil

The government's assumption that market forces would work to keep prices of drugs stable is not borne out by previous experience. After the last round of price decontrol through Drug Price Control Order of 1987, there has been a spiralling rise in prices of drugs. Table 7 gives some examples. Further, the market forces logic is even less applicable to the pharmaceutical industry than other sectors. Unlike consumer goods, drugs are not purchased by the consumer on the basis of his choice or preference. They are purchased/consumed on the advise of the medical profession. The drug companies have built a market for their drugs through their extensive marketing network. The consumers have little or no choice in such a 'rigged' market and are forced to buy anything and everything that doctors are 'induced' to prescribe by the 'friendly neighbourhood' medical representative. This is surely not the best climate for market forces to stabilise prices. Table 8 also exposes the argument that there is enough competition in the industry to ensure competitive pricing. What we have is a tendency towards cartelisation with a few companies holding monopoly share of particular segments of the industry.

Further, the proposal to allow automatic price increase (in order to offset input cost increase), will have a spiralling effect on drug prices. We have no evidence that would reassure us that this facility will not be grossly misused by manufacturers to arbitrarily increase drug prices. Even when such a system was not in use, companies have repeatedly overcharged. The baralgan ketone case involving Hoechst with the company charging over 10 times the notified price exemplifies this. It took the government many long years to recover even a part of this 'unintended' profit. Allowing automatic price increase will only legitimise loot.

With rapid developments in science and technology there has been an explosion in the number of drugs which are available in the market. Unfortunately only a small number of these drugs entering the market offer therapeutic advantage over existing drugs. For example of the 348 new drugs from the 25 largest US drug companies between 1981 and 1988, the US FDA said that at the time of introduction: 3 per cent (12 drugs) made an "important potential contribution to existing therapies"; 13 per cent made a "modest potential contribution"; and 84 per cent made "little or no potential contribution". A French study of 508 new chemical entities marketed in the world between 1975 and 1984 found 70 per cent offered no therapeutic improvement over existing products. The situation in India is no different and probably worse, given the fact that our drug control mechanisms are much more lax than in developed countries. Moreover, very few drugs are actually developed in this country, but are introduced here after their introduction in the west.

As a consequence there are an estimated 60,000 to 80,000 brands of various drugs available in the Indian market. In this situation of extreme anarchy the task of an already overstretched drug control authority becomes almost impossible. A majority of the estimated 80,000 products in the market are either hazardous, or irrational or useless. The problem is compounded by the fact that there is almost no source of regular unbiased authentic information on drugs available in the country. A bulk of medical practitioners depend on promotional material supplied by pharmaceutical conpanies. In this context a WHO report says "there is an inherent conflict of interest between the legitimate business goals of manufacturers and the social, medical and economic needs of the providers and the public to select and use drugs in the most rational way" (*Clinical Pharmacological Evaluation in Drug Control*, EUR/ICP/DSE 173, Copenhagen, WHO, 1993).

The need to increase drug production to Rs 15,000 crore by 2000 AD from the present Rs 7,000 crore has been repeated *ad nauseam* both by the industry and the government. But no thought seems to be given to what kind of drugs this large volume would include. Drugs are not like cereals or cars or washing machines! In the absence of a clear-cut policy to ensure and channelise drug production in a certain direction, what is to prevent a major share of the production from being diverted into non-essential areas? The new policy has no ideas to offer in this regard and only talks of liberalisation as the answer. More liberalisation may well mean licence to produce more hazardous, irrational and inessential drugs.

It is thus important for the government to step in, to control and regulate the growing

Table 7: Price Increase of Drugs

(In Rs)

Drug	No of Tabs	Dose	Price before DPCO 1987	Price after DPCO 1987	Per Cent Increase
Antacides					
Digene Gel		210 ml	7.61	11.91	56.50
Polycrol Forte Gel		400 ml	13.18	21.30	61.61
Laxatives					
Agarol		400 ml	20.71	40.76	96.81
Cremaffin		210 ml	9.20	20.25	120.11
Dulcolax	100	5 mg	16.00	49.50	209.38
Cardiovascular Drugs					
Inderal	10	40 mg	4.10	6.87	67.56
Norpace	10	100 mg	16.63	27.40	64.76
Isoptin	30	40 mg	16.17	26.58	64.38
Aldomet	10	250 mg	9.77	13.00	33.06
Anti Coagulant					
Acitrom	10	4 mg	1.83	5.53	202.19
Hormonal/Oral Contraceptives/Corticosteroids					
Ovral	21		4.84	16.56	242.15
Duphaston	10	5 mg	23.48	115.00	389.78
Antibiotics					
Althrocin	10	250 mg	18.02	26.66	47.95
Campicillin	10	250 mg	14.72	20.40	38.59
Doxt	4	100 mg	6.80	9.07	33.38
Paraxin (chloromycetin)	10	250 mg	5.72	10.36	81.12

business of medicine as is done the world over by the FDAs The fundamental right of trade in the business of medicine cannot be a cause for the drug control authorities to behave otherwise Instead, today, paeans are being sung to the virtues of decontrol Table 9 shows the kind of irrational and hazardous drugs which enjoy a large market share, contrary to any evidence that medical science today provides, based solely on the ability of pharmaceutical manufacturers to push their products through a mammoth marketing network With further decontrol such a situation can only worsen

The new policy is to base itself on the note on 1986 Drug Policy that was circulated in 1992 among members of parliament Many of the proposals outlined in the note will have grave consequences for the self reliant growth of the drug industry in India The review note derives satisfaction from the positive trade balance achieved by the industry What is glossed over is the fact that the figures quoted actually conceal the *increased* dependence on imports in bulk drug production The government's note itself claims that almost the entire formulation demand is met indigenously meaning that almost the entire imports are for bulk drugs Thus the relative figures for bulk drug production and imports (in Rs crore) would be as follows

	Production	Imports (Estimated)	Availability	Per Cent of Imports
1980 81	240	100	340	29 4
1990 91	700	650	1 350	48 2

Formulation production is a relatively much simpler exercise and even countries like Bangladesh are relatively self sufficient in this area Self reliance in bulk drug production is actually the true indicator of self reliant development of the drug industry If the above trend continues India may soon become like any Banana republic depending largely on imported bulk drugs This is a matter of shame given the fact that as far back as in 1984 UNIDO had categorised India amongst those countries with necessary technology to produce almost all essential bulk drugs from basic stage

It is proposed in the note that tariff mechanisms will ensure manufacture from basic stage We have noted earlier that there is an increased tendency towards dependence on imports in bulk drug manufacture What tariff measures will reverse this trend is not at all clear especially as the review note talks about import liberalisation Further, the world prices of bulk drugs keep on fluctuating constantly How will tariff measures keep pace with such fluctuations? We fear that the measures proposed will open the way for more imports and write an epitaph to indigenous manufacture of bulk drugs

The review note also puts forward the proposal to do away with ratio parameters linking bulk drug manufacture to formulation activity It needs to be understood that large companies have a stranglehold on the market due to the brand images of their formulations With this step, there will be even less incentive for large companies to produce bulk drugs This will further aggravate the trend towards bulk drug imports

The government would do well to go back to the Hathi Committee report of 1975 detailing the sins of omission and commission of the foreign sector in the drug industry, when it is set to allow 51 per cent equity participation by MNCs Nothing has changed since then, in fact the situation has worsened The foreign sector are the worse offenders when it comes to production of irrational and hazardous drugs and the non-production of essential drugs In fact the small scale sector produces more bulk drugs than the foreign sector The measures in the 1978 Drug Policy restricting this sector, is the single most important factor responsible for the growth of the Indian drug industry in general and the Indian sector in particular The foreign sector has never in the past brought in new technology and will not do so in the future Allowing concessions to them will only result in emasculation of the Indian drug industry

The review note summarily dismisses the role of the public sector and in fact talks of further denuding it Let it not be forgotten that it was the public sector which started production of vital drugs like antibiotics in this country which led to drastic fall of drug prices until then marketed only by MNCs Deliberate neglect mismanagement, corruption and sabotage at various levels has brought the public sector to its present pass Instead of thinking about measures to revitalise it the government wishes to initiate its funeral rites Today when the global pharmaceutical industry is poised for a new

TABLE 8 OLIGOPOLY IN DRUG INDUSTRY

(In Rs 000)

	Therapeutic Group	Total Market of Group	Share of Top Brands	Percentage Share	Brand (Nos)	Companies (Nos)
1	Antacid etc	1790065	694646	38 81	5	5
2	General Nutrients	758531	264545	34 88	3	2
3	Vitamins	2353495	1004507	42 68	8	5

17	Cough and Cold Preps	1857988	589023	31 70	6	6
18	Anti Histaminic	684380	226826	33 14	2	2
19	Antibacterials	1757643	1077863	61 32	7	4
20	*Antibiotics*	7353705	3688295	50 16	31	
20 1	Tetracyclines	737617	438846	59 50	4	4
20 2	Chloramphenicols	330974	100145	30 26	1	1
20 3	Ampi/Amoxycillin	2515369	1191674	47 38	10	10
20 4	Cephalosporins	1254491	462061	36 83	3	3
20 5	Cotrimoxazole	961144	673516	70 07	4	3
20 6	Erythrocin	652952	490152	75 07	3	3
20 7	Streptomycin/Comb	111315	83541	75 05	1	1
20 8	Penicillins	329365	172413	52 35	2	2
20 9	Pen Strep Comb	173052	151741	87 69	2	2
20 10	Others	287426	68139	23 71	1	1
21	Digestive Enzymes	545152	203111	37 26	3	3
22	Antiseptics	265384	130053	49 01	2	2
23	Sex Hormones	766729	141067	18 40	2	1
24	Oral Electrolytes	203395	168333	82 76	1	1
25	Anti Diabetic	493109	181844	36 88	2	2
26	Anti Epileptic	340099	193402	56 87	2	2

Note The above table is based on an analysis of ORG statistics of 120 top selling products in December 1992 The table shows the market share enjoyed in each therapeutic group by these top selling brands as well as the market share of companies owning these brands It will be appreciated that the market share of top companies is likely to be higher as the above statistics pertain to only top 120 products It may also be mentioned that though there are 60 80 000 brands in the market the top 120 brands account for 35 3 per cent of the market

revolution with the help of biotechnology, only the public sector has the capacity to compete with MNCs and ensure a self-reliant growth. No company in the private sector has either the inclination or the will to make the kind of investments necessary to keep pace with technological developments in frontier areas.

Steps to encourage R and D in the drug industry, mentioned in the note, are welcome. But two facts have been ignored in the discussion. First, it is well known that the strength of the R and D base in the drug industry lies in the area of process technologies. If the Indian Patent Act is changed in line with the GATT agreement, this base will become meaningless. Today the industry is not, by and large, in a position to invest in development of new product technologies. Pious wishes aside, it needs to be understood that the investment required to develop a new product with definite therapeutic advantage is far in excess of the total turnover of most Indian companies. Thus in our present stage of development the major thrust in R and D has to be in the area of process technologies. Any change in the Indian Patent Act will make the whole exercise of giving incentives for R and D meaningless. Secondly, the major contribution to development of process technologies comes from the CSIR laboratories. Merely giving incentives to drug companies which use technologies developed by CSIR laboratories is not going to give a boost to our R and D efforts.

The GATT agreement has a direct bearing on the drug industry in the country. In fact drug industry is one of the key areas which are being directly targeted by the agreement. In brief, following are some of the likely fall-outs of the GATT agreement. The Indian drug industry has built up a base for production of almost all bulk drugs from basic stage using innovative process technologies. The CSIR played a major role. This has been possible because of Indian Patent Act of 1970 which allows process patents and not product patents in vital areas including durg production. One of the clauses in the GATT agreement is that India change its Patent Act to include product patenting for a period of 20 years.

Change to a product patent regime will mean that the whole R and D base in the area of drugs will become useless. We will become dependent on technology imports, which in turn will seriously affect the growth and even sustenance of the Indian sector. It is true that some large Indian companies, who are going in for joint sector ventures with MNCs, today support a change in the Indian Patent Act. But these companies do not represent the interests of the vast majority of Indian companies.

There is a danger of regressing to the pre-1970 situation when the Indian drug market was controlled by MNCs and drug prices in the country were one of the highest (in real terms) in the world. The American Senate Committee (Kefauver Committee) had in fact cause to comment on this situation in the 1950s. The situation then was to an extent saved by the development of a strong Public Sector (HAL and IDPL) especially in antibiotic production. With progressive emasculation of the public sector even that 'safety net' does not exist.

The implications of a product patent regime are not limited only to the area of technological self-reliance. Technological dependence on MNCs is the proverbial 'thin edge' which will be used by the MNCs to establish their suzerainty over the Indian drug market once again (a position they had lost after the mid-70s). Drugs which have shown the maximum rise in sales in the last few years are in categories which include the overwhelming majority of drugs still under product patent or whose product patents have expired recently. In other words if we had a product patent regime today, the drugs showing fastest growth would have been priced way beyond the capacity of the average consumer.

It has been argued that the 10-year transition period to a product patent regime will ensure that we build up technological self-reliance in product technologies. This can at best be described as a fond hope that is not borne out by facts and previous experiences. The R and D investment required for development of new products is way beyond the reach of Indian companies. With the public sector being increasingly marginalised, the only sector capable of such focused investment, is ruled out.

Another argument is that by signing GATT, prices of essential drugs will not be affected. This again is not borne out by facts. There is no absolute entity called essential drugs. New drugs are constantly being introduced and old drugs become obsolete. It is totally unacceptable to argue that the poor people of India shall have to remain satisfied with old, near obsolete drugs even when better alternatives are available in the world market.

The drug industry has to be viewed differently from other industries. Market demand is not regulated by prices of drugs, as demand primarily depends on prescription habits of doctors, disease profiles, drug resistance, etc. Hence the market cannot ever be a proper mediator of prices of drugs. Further, this is compounded by the oligopolistic nature of the industry where a few companies have monopoly within various therapeutic groups. In such a situation abandoning price and production controls with the fond hope that the market shall regulate prices can only lead to unjustified rise in prices. The use of tariff measures or price control mechanisms to regulate production cannot work and specific production control measures are necessary. Concessions to the foreign sector are aimed, not at improving the health of the nation, but at improving the health of the balance sheets of MNCs. It is indeed unfortunate that the government has chosen to sell-out the interests of the Indian people to the interests of profiteers in the industry and the MNCs.

TABLE 9: SALES OF IRRATIONAL DRUGS IN 1992

Rang	Drug	Description	Sales (Rs crore)	Growth (Per Cent)
6	Becosule	Irrational vitamin combinations	23 92	0.5
10	Dexorange Plus	Tonic	20.11	17.0
16	Liv 52	Useless liver drug	17.80	15.8
17	Neurobion	Irrational vitamin combinations	15.88	31.0
20	Electral	Irrational oral rehydration	16.83	24.4
24	Revital	Oral ginseng tonic	15.05	19.0
26	Corex	Irrational cough mixture	13.83	12.2
28	Benadryl	Irrational cough mixture	13.56	2.1
30	Ampoxin	Irrational antibiotic combinations	13.30	0.3
32	Baralgan	Hazardous anti spasmodic	13.17	10.2
35	Cobadex Forte	Irrational vitamin combinations	12.88	39.3
36	Combiflam	Irrational analgesic combinations	12 78	23.4
38	Polybion	Irrational vitamin combinations	12.48	10.4
41	Phensedyl	Irrational cough mixture	11.96	1.2
44	Gellusil MPS	Irrational antacid combinations	10.72	21.0
48	Novalgin	Hazardous analgesic	10.53	15.3
56	Complan	Food product (non drug)	9.23	6.0
63	Vicks Vaporub	Useless cold remedy	8.71	27.6
66	Ostocalcium	Irrational calcium combinations	8.67	6.3
71	Haem-Up	Irrational tonic	8.50	18.2
72	Enteroquinol	Hazardous antidiarrhoeal	8.43	16.5
77	Macalvit	Calcium syrup	8.09	6.3

Note: Of the 80 top selling products, 23 are either irrational, or hazardous or both. The combined sales of these was Rs 286.63 crore, i e, almost 10 per cent of the turnover of drugs. This is only the tip of the iceberg as the above analysis is of only the top selling products, while there are hundreds of other such products in the market.

Kamani to Kanoria

Marxists and Workers' Co-operatives

A K Roy

Workers' co-operatives have proved to be a viable alternative to the state's current response to industrial sickness: Left parties and their affiliates would do well to actively support these efforts.

THE crackdown of the rail and road blockade on September 9 at Uluberia near Calcutta did not close the chapter once started by the workers of Kamani Tubes in Bombay in 1989 and now highlighted by 3,000 workers of Kanoria Jute Mill after they broke open the lock put by the management, to reopen the mill on December 19, 1993. The government has no solution to the problem of sickness and closure of industries. Even nationalisation has failed, with many public sector units awaiting the guillotine at the hands of the Board of Industrial and Financial Reconstruction (BIFR). The opposite step, privatisation now popular, has also failed to evoke confidence as most of the sick industries are in the private sector. The recent privatisation of the oxygen plant of Heavy Engineering Corporation, Ranchi, shows that these private 'doctors' are trained to treat only healthy units. A seven-member Onkar Goswami Committee set up by the present government, however, has come out with a solution and that is the speedy scrapping of sick industries. But killing rather than curing as the way of speedy disposal of cases can hardly be accepted as the desired solution. So the problem remains.

The media, both the right and the left, has done great disservice to the Kanoria struggle by projecting the issue as a confrontation between the Sangrami Shramik Union (SSU) spearheading the movement and the state government though the leaders have repeatedly pointed out from the very beginning that their target is the owner of the mill and not the state government. One wonders, how the Left Front gains if the Kanoria struggle crumples and its owner S S Pasari returns victorious to the mill. Similarly, insistence on accepting one private promoter with 60 per cent equity is also mysterious when the workers' co-operative is ready to take responsibility of production with 100 per cent equity. The proposals to substitute owners by workers as promoters to start closed units may upset private industrialists. But why should that unnerve a Left Front government?

Many explanations are afloat for the strange behaviour of the state government. The most publicised one is the pressure of organised trade unions apprehensive of their leadership if the SSU succeeds. This means, sick industries have sick trade unions needing the government help for their rehabilitation. If we are to dismiss this as a canard the next explanation that comes which appears more dignified is that the West Bengal government is developing 'friendliness' with the private capitalists and the multinationals to invite 'capital' and the backing of SSU may thwart the process. This leads to a basic question: What is 'Capital'? Is the definition of 'Capital' same for a Marxist as for a capitalist? Does it mean that Karl Marx has written all the volumes on capital in vain which is now not accepted even by the Marxists in West Bengal? Moreover, the problem before the country is not the lack of capital but idle capital, as the 'hand' is too sick to handle. If the development strategy of the Marxists is the same as that of the centre, i e, importing 'capital' by wooing the capitalists and multinationals then why the movement against the New Economic Policy? This explanation then should also be brushed aside as a conjecture. The only explanation therefore would be that the idea of having workers' co-operatives to fight industrial sickness and capitalists ills is not a Marxist one; so the Marxists of the country whether in Bombay or Calcutta are not interested in Kamani or Kanoria.

Before going into the historical premises of this theoretical question about the Marxist way and workers' co-operatives, the immediate practical dimension of the problem affecting the people should be kept in view. In December 1980 there were 24,450 sick units including 409 big ones. In 1987 the number increased to 1,59,938 and 1,712 According to the Gandhi Labour Institute about 65 factories are falling sick or being closed every day or 25,000 a year. The Onkar Goswami Committee stated that in 1989, 2,269 large and medium factories with a total bank credit of Rs 6,926 crore were sick. At present the total number of sick units—small, medium and big would be around 3 lakhs blocking Rs 15,000 crore and affecting the job of 5 million people, i e, more than double the numbers employed in all the PSUs. This number with the exit policy of the government, has 'jacked up' the number of the unemployed in the country's employment exchanges to 3.6 crore in the last one-and-half decades, from less than one crore, creating a severe social strain now threatening the unity and integrity of the country in the form of communalism, regionalism, etc. On the causes of industrial sickness the Tiwary Committee appointed by the Reserve Bank of India revealed that while 52 per cent of the units were sick due to mismanagement, 46 per cent due to infrastructural problems and only 2 per cent due to 'labour problems'.

Industrial sickness has spread to PSUs as well. Out of a total 244 PSUs about 100 are incurring losses, 58 perennially which including, of course, 46 units taken over from the private sector where they fell sick. IISCO, MITCO, IL, HFC, etc, are to be auctioned. However, profit-making concerns like Maruti were privatised or given to the multinationals. Even after displaying impressive show of police power against the Kanoria workers or Dala workers in UP sometime back, the government has no solution to this problem. Vain raids of the houses of some Provident Fund defaulters including that of the owners of Kanoria Jute Mill may create a front page news but that can hardly feed the empty stomachs of jobless workers. The Industrial Dispute Act also does not help with the sections 25 (O) and 25 (N) which the Onkar Goswami Committee want to delete as the government cannot stop closures; at best it can institute prosecution cases which hardly worry employers with high court judgments being so biased.

Moreover, the government policy itself is the first cause of sickness. The Constitution could not ensure the right to work even after enshrining the right in Article 43(A) of the Directive Principles but has provided the right to closure to the employers. Even the Sick Industrial Companies (Special Provisions) Act 1986 with BIFR has only been able to touch the tip of the iceberg and that too with the precise aim of winding sick units up. Thus with all avenues leading nowhere the organised trade unions are consoling themselves by organising seminars, bandhs and periodic trips to Delhi whose routine repetitions are making those steps even more ineffective.

Kamani Message

It is against this background the message of Kamani to Kanoria is to be read and fitted to the theoretical premises of the Marxist strategy to be applied to the country. If an industry is techno-economically bankrupt, then that should be scrapped if not it should be revived. If the employer fails and the government falters the workers have the right to step in. The Calcutta High Court by permitting occupation but denying production has gone only halfway while the Allahabad High Court in its historic judgment by Justice P. S Dhawan on October 15, 1992 in the matter of Kripal Ispat, Gorakhpur, declared the workers' right of ownership of such units for which the Kanoria workers are fighting.

The judgment says "The factory has been closed and the workers have not contributed to this There is neither closure nor a lock-out This under the law and equity (and this equity is justice) their salaries will be computed as being in arrears unless they are paid in totality The arrears against their salary is their investment as the equity in the company " After acquiring the right to run the factory the workers may need some working capital which they would repay by the value created by their labour power

The state as the banker for the workers was the 'discovery' of Louis Blanc (1813-82) who connected pre-Marxian utopians with post-Marxian socialists which conceived the 'workers' co-operative The issue was discussed by Karl Marx and favoured by all socialists The *History of the International Working Class Movement* published in the erstwhile Soviet Union (1981) has a chapter on 'The Co operative Movement' in the second volume which says "The workers used producers co-operatives as a means of withstanding the onslaught of the capitalists and win an improvement of their living standard The founders of scientific communism gave a clear-cut assessment of co-operative movement's significance to the proletariat They noted that it constituted the 'first breach' in the old forms of runnning the economy " The co operative movement grew significantly in the 1880s with its political orientation dependig on the character or working class movement In England the co-operative proclaimed its autonomy in regard to political parties In Germany, Austria and Italy, though structurally autonomous, the co-operatives were influenced by the parties of the working class But in Belgium, Netherlands and France, the co-operatives were directly linked to socialist parties From Kamani to Kanoria the workers' co-operatives may be classified in the second category

Co-operation is the basis of socialism Marx, the father of scientific socialism, was a great advocate of all co-operative endeavours In the Volume I of *Capital* he devoted a whole chapter to co-operation, where he said, "the offensive power of a squadron of cavalry is essentially different from the gun of the offensive of individual cavalry" and "productive power developed by labourer while working in co-operatives is the productive power of capital" In the Vol III of *Capital*, Marx wrote on workers' co-operative clearly upholding what the workers of Kamani and Kanoria are trying to highlight

"Co-operative factories furnish proof that the capitalist has become no less redundant as a functionary in production as he himself, looking down from his high perch finds the big landowners redundant" In a co-operative factory the antagonistic nature of the labour supervision disappears because the manager is paid by the labourers instead of representing capital counterposed to them." It is manifest from the public accounts of the co-operative factories in England (1864) that—after ' ...cting the managers' wages which ' ...m a part of the invested variable capit... much the same as the wages of other l...bourers—the profit was higher than the average private manufacturers"

Frederick Engels added in the footnote "In a case known to me, following the crisis of 1868, a bankrupt manufacturer became paid wage labourer of his own former labourers The factory was opened after the bankruptcy of its owner by a labour co-operative"

While one is not sure whether the workers of Kanoria would agree to employ S S Pasari their owner as a wage-labourer if their movement succeeds, the performance of the workers' co-operatives in India corroborates what Marx recorded more than a century ago After the takeover of the management by the workers co-operative in 1989 Kamani Tubes is running successfully for the last four years Overcoming all odds and unfair competition, production has increased The workers received Rs 120 lakh and Rs 155 lakh as wages in the first two years and the government was paid Rs 173 lakh and Rs 220 lakh respectively by way of excise duties and other taxes Between 1989-90 and 1991 92 the turnover increased from Rs 1,063 27 lakh to Rs 1,454 34 lakh and the operating profits were Rs 84 36 lakh and Rs 61 34 lakh

Not only the western zone but even the much maligned eastern zone is also not lagging behind New Central Jute Mill, Calcutta, is also being run by the workers' co-operative since 1989 and its turnover has increased by 50 per cent from Rs 56 crore in 1988 89 to Rs 84 crore in 1991 92 with operating profit for that year being Rs 4 69 crore In small-scale sector the results of nine units surveyed around Calcutta show encouraging results both in terms of return and employment

Emphasising the importance of workers' co-operatives both as a model to understand the social dynamics and as an alternative, what Marx says in the same *Capital* should be a guide to all his disciples including those ruling in West Bengal "The co-operative factories of the labourers themselves represent within the old form the first sprouts of the new, although they naturally reproduce and must reproduce everywhere in their actual organisation all the shortcomings of their prevailing system But the anti-thesis between capital and labour is overcome within them, if at first, only by enabling them to use the means of production for employment of their own labour They show how a new mode of production naturally grows out of an old one, when the development of the material forces of production have reached a particular stage "

So there could also be a co-operative mode of production in between the capitalist and socialist mode of production This has great relevance to India with a complicated social milieu failing to connect work ethics with class struggle where even proletarian politics is in the hand of the parasitic class Thus when the country is debating the public sector vs private sector for a national choice for economic development, the struggles of Kamani and Kanoria workers have posed a third alternative The workers' sector; making the working class the future architect of the Indian economy replacing the private industrialists, multinational companies, NRIs and even the state—till the state itself comes under the leadership of the working class Not only is this a Marxist proposition deserving all round support from the left but perhaps the only Marxist alternative to the new economic policy of the centre in the present context Encouraged by this prospect many voluntary organisations such as Workers' Solidarity Centre in Bombay, Nagarik Manch in Calcutta and Centre for Workers' Management in Delhi have come forward in support of workers' co-operatives

This does not mean that the workers' co-operative alone can bring about social change, cure sickness and eliminate workers miseries The First International (1864 66) noted in its minutes 'To convert social production into one large and harmonious system of free and co operative labour, general social changes are wanted changes of the general conditions of society never to be realised save by the transfer of the organised forces of the society, viz, the state power, from capitalists and landlords to the producers themselves ' Lenin regarded the co-operatives as an instrument to achieving some improvement of the working people's material conditions, but noted that "improvement secured by co-operative societies are confined within very narrow limits as long as the means of production and distribution remain in the hands of the man whose expropriation is the chief aim of socialism" Nevertheless, if fructified with the correct politics of struggle and construction, as the late Shankar Guha Neogy showed in Dalli Rajhara, at least in India the workers' co-operative can provide a new starting point, breathe fresh air, and emancipate and raise the working class to the leadership of the politics now pushed to the background under the pressure of caste and religion Even with all limitations and running a constant risk of itself becoming the victim of capitalist ills, it is definitely better than the present-day trade unionism where the leaders have become pleaders and the workers bargainers, holding the red flag for bonus and the bi-coloured for votes

he delivering historic judgment in the case of Kamani Tubes, on September 19, 1988 in the Supreme Court, Justice M P Thakkar said "Tens of thousands of similarly situated workers would be watching with anxious eyes the outcome of the experiment undertaken by the workers of KTL. I, therefore, not only hope and trust but also beseech them to rise to the occasion and do their best to make it a success." The Kamani workers did rise to the occasion, so the movement has spread and reached West Bengal, where it has an immense potentiality and with a Marxist government in the saddle, to develop an alternative economic line to that of the centre. From Kamani to Kanoria is a long march to reach the goal. Will the Left Front government rise to the occasion to make that mission a success?

World Summit on Social Development

Choice of Agenda Issues

Manu N Kulkarni

The World Summit on Social Development is far too important an event to be ignored to NGOs. Only with their active participation can issues relevant to the local level be brought on to an international platform.

WORLD summits are now getting popular. From World Summit for Children in 1990 to Earth Summit in 1992 to the Population Summit in 1994 and then Social Summit in 1995—UN Agencies have generated enormous information and world wide thought processes and actions and also gained expertise in holding such summits. Agenda 21 of the Earth Summit was a massive document and even now nations which ratified several agreements and conventions have still to understand the implications of the agreements which they signed leave apart the implementation of these conventions. Preparations for the Social Summit have been launched with the release of UNDP's *Human Development Report (HDR) 1994*. In fact the report itself reads like an agenda for the Social Summit and the choice of issues for discussion in the Summit is thrown open to the world audience. Unfortunately the kind of euphoria which Earth Summit generated even at the time of prepcoms is not to be seen in the case of Social Summit. The NGOs stole the limelight not only in the prepcoms but also in the Earth Summit at Rio. In fact the suggestion to constitute an Independent Commission for Sustainable Development was from the NGOs.

If the World Social Summit has to be 'owned' by the people of both the developed and developing countries then NGOs have to be in the forefront in the forthcoming Social Summit. But from a careful reading of the *HDR 1994* one gets a feeling that the Social Summit will be packed with UN bureaucracies and donors/creditors and the third world debtor/countries would be onlookers in the Summit.

The UNDP has suggested a seven point agenda for the forthcoming Social Summit in March 1995. These are (1) Approve a world social charter as a new social contract among all nations and all people. (2) Endorse a new development paradigm of sustainable human development with economic growth centred on people and sustainable from one generation to another. (3) Give the UN the mandate to draw up a comprehensive blueprint for ensuring global human security and protecting people from threats in their daily lives like poverty, unemployment, etc. (4) Agree on a targeted reduction of 3 per cent a year in global military spending for the decade 1995-2005 and credit the savings thus accrued to global security fund. (5) Approve a human development compact of 20 20 for the next 10 years by countries and agencies. (6) Recommend to ECOSOC that it examines the feasibility of various forms of global taxation—especially taxes on global pollution and speculative movements of capital to raise adequate financing for setting up a new global fund for human security. (7) Urge international community to strengthen UN in socio-economic field by establishing what is called UN Economic Security Council to manage the new dimensions of human security.

This itself is a complex and exhaustive agenda, and if in this Summit the world leaders either agree or come to some sort of consensus then it would be an achievement. Otherwise the Summit is a failure. Nobody disagrees with the concept of human security—job security, income security, health security, environmental security and security from crimes. The *HDR 1994* has captured the people's feeling of security (p 23). A woman in Nigeria says "My security is only in the name of Lord who has made heaven and earth. I feel secure because I am at liberty to worship whom I like, how I like and also because I can pray for all the people and for peace for all over the country."

A secondary school child in Mongolia says "Before, education in this country was totally free, but from this year every student has to pay. Now I do not feel secure about finishing my studies." A man in Ecuador says "What makes you feel insecure above all is violence and delinquency as well as insecurity with respect to the police. Basic services are also an important part of security." Insecurity arises basically from threats from the state (physical torture) threats from other states (war) threats from other groups of people (ethnic tensions) threats from individuals (crime and street violence) threats against women (rape and domestic violence) threats to children (child abuse). Ensuring safety and security to the citizens in any given country is not just the look out of the state but also of the citizens as well. Many developing countries have poor record of human rights protection. Developed countries are abetting the crimes by setting up one ethnic group against the other. How can the leaders in the Social Summit agree to ensure security to its citizens? Human and civil rights activists are always in loggerheads with the states. What is going to be the consensus in the summit? Will there be an international civil/human rights commission to oversee the security problems of civilians in the developing countries? Yes we want security but how do we ensure it? Such questions need deliberations by a wide section of human rights activists across the world before the Social Summit to bring practical orientation to the issue of security in the summit. The *HDR 1994* does not throw light on such questions on how to go about in the business of providing life protection and security? This issue will be hotly debated in the summit if civil rights activists have their way!

Global military spending declined between 1987 and 1994 at an estimated average annual rate of 3.6 per cent yielding a cumulative peace dividend of $ 935 billion—$ 810 billion in industrial countries and $ 125 billion in developing countries. "But it is difficult to track where these funds went. And there has been no clear link between reduced military spending and enhanced expenditure on human development." Of the current arms supplies 86 per cent originate from the five permanent members of the Security Council. India and Pakistan accounted for more than 18 per cent of world's arms imports—nearly twice as much as Saudi Arabia's share. The Report has made radical suggestions to reduce the military spending make aid allocations dependent on the recipient country's ratio of military

to social spending—progressively reducing aid as the ratio becomes greater than 1" But what is the prospect of enforcing this? Who will sign this treaty? When the *HDR 1994* says we do not know where the peace dividend went, how will we know from time to time what is the arms reduction taking place? Defence is a highly secretive business and even the most professional NGOs have no access to this information We will have to depend on the governments and the heads of the state and when there is no transparency there is no accountability and no peace dividend Armament industry provides the biggest kickback to the politicians and the bureaucrats alike One wonders how in the forthcoming summit any decision will be taken at all on this sensitive issue

Oscar Arias, winner of 1987 Nobel Peace Prize says in the *HDR 1994* that a global demilitarisation fund should be established to add dynamism to the current demilitarisation trend by rewarding primarily, but not exclusively the efforts of developing countries, to disarm and demobilise their armed forces promote arms control, reintegrate military personnel into society, etc These are very laudable ideas but are not implementable or enforceable We have to learn from Earth Summit experience What is happening to Global Environmental Facility (GEF) We have yet to see what it is doing and who is benefiting from GEF in developing countries These initiatives would attract bureaucratisation and the original intentions are never realised Defence issues are generally beyond the understanding of common people and unless these are discussed in a transparent manner the ideas never get translated into action

Human development programmes are person-intensive and not capital intensive It is true that 20 20 compact is a good tool for investing in human development programmes by aid agencies and national governments but the problem is not with initial 20 per cent but the subsequent 30 or 40 per cent needed for maintenance of human development structures like school buildings, health centres, water facilities, etc It is a common sight to see broken school buildings, health centres without drugs and water pipes without water in all third world countries Maintenance burden in human development programmes is heavy How can we address this? No answer is forthcoming in the *HDR 1994* Global prescriptions are not relevant for local problems for, unfortunately, human development is more local than global Can the Social Summit provide answers to these local problems?

The use of existing foreign aid in the recipient countries is a more serious issue than the quantum of aid The development funds of UN (UNDP, UNICEF, UNFPA, IFAD, WFP) provides nearly $ 5 billion a year to developing countries If all this had been used effectively, by now, mortality and quality of life would have improved significantly in many developing countries But the capacity of aid-receiving countries to improve their systems and procedures of handling and using aid has been poor In fact the World Summit should discuss more seriously developing countries' capacity in using aid effectively

The agenda on global taxation, economic security council and ideas like establishing global safety net, world income tax and Tobin tax on foreign exchange movements, Islamic Science Foundation are all grandiose but are they implementable? In the words of Abdus Salam, Nobel Laureate in Physics who has proposed this Foundation, "The Foundation would be sponsored by Muslim countries and operate within them It would be non political, purely scientific and run by eminent people of science and technology from the Muslim world ". Salam also suggests that it would build links with UNESCO and other UN bodies In the days of secular movements worldwide one wonders whether moves to create 'Islamic-science' and 'Jewish science' and 'Hindu science' and 'Christian science' are really the right steps

If the World Summit is going to discuss science and technology for human development it should also include in the agenda the role of religion in human development because religious institutions have played critical roles in promoting human excellence in many developing countries In the Earth Summit at Rio, Buddhists monks from Thailand, Bahai International and Ramakrishna Missions, Christian missionaries played a significant role in providing inputs to various sessions All these issues need to be widely discussed among a cross-section of the people around the world to make the World Summit people-oriented

REVIEW OF AGRICULTURE

Agrarian Changes and Attached Labour

Emerging Patterns in Haryana Agriculture

Surinder S Jodhka

Explaining the phenomenon of attached labour in the post-green revolution agrarian context has been a contentious issue among the students of agrarian change in India. Characterisations of attached labour varies from 'unfree slaves' to a 'privileged class'.

Based on an intensive field study of three villages of a green revolution district of Haryana, this paper argues that far from being a privileged class, attached labourers are the most deprived category in the agrarian society of Haryana. Attached labour functioned more as a labour mortgage system *for interest free credit rather than a subsistence guarantee arrangement.*

However, though attached labour is still perpetuated through prolonged indebtedness and obviously has elements of unfreedom, counter-tendencies are also significant. Along with other factors, weakening of the ideology of patronage and loyalty, availability of employment outside agriculture and, most importantly, growing dislike of the relationship among labourers has given rise to tensions and conflicts leading to a gradual decline of the system.

I
Introduction

ONE of the central questions in the literature on agrarian transition during the post-independence period has been the nature of changes in relations between the landless agricultural labourers and the landowning employer farmers. Perhaps the most contentious issue in this literature is that of explaining and conceptualising the phenomenon of attached labour.

In the conventional understanding of the agrarian question, development of capitalism or 'modernisation' of agriculture should lead not only to an increase in productivity and integration of agriculture into the broader national market, but also bring about a fundamental change in the social relations of production leading to freeing of agricultural labour from all kinds of patronage and institutionalised dependency relationships.

Some scholars did argue that such a change was under way in Indian agriculture, particularly in the regions where green revolution had been a success. Breman, for example, reported that in south Gujarat the traditional dependency and bondage relations were undergoing a fundamental change. He called this process of 'freeing' of agricultural labourers as 'depatronisation' [Breman 1974]. In a later study he again argued that the inter-generational bondages characterised by extra-economic coercion no more existed in south Gujarat and the existing system of attached labour was not similarly an unfree relation [Breman 1985: 131, 306-13]. Similarly, though Bhalla found elements of continuity, she observed that in Haryana countryside the relations between farmers and attached labourers were changing into formalised contractual arrangements [Bhalla 1974].

Taking the clue from Bhalla's study, Bhaduri in an important contribution highlighted the elements of continuities in production relations in the green revolution region of Haryana and provided an opposite interpretation. He argued that the presence of attached labour and debt dependencies meant that the mode of production even in the green revolution belt of Haryana was 'semi-feudal' [Bhaduri 1984: 115].

Bardhan and Rudra, however, strongly refuted the formulation that prevalence of attached labour necessarily meant 'semi-feudal' mode of production. "This kind of careless labelling is worse than inaccurate" [Bardhan 1984: 159]. Bardhan argued that the feudal institution of bonded labour marked by hereditary and long-term indebtedness, entailing continuous and exclusive work for the creditor employer and some form of extra-economic coercion is very different from the present day forms of attached labour which is 'voluntaristic' rather than a coercive arrangement. "The modernisation of agricultural technology", Bardhan reported, "had in fact increased the demand for attached labourers as they were seen to be useful in overseeing the work of casual labourers. Farmers found the two-tiered labour system useful in keeping possibilities of the emergence of class solidarity among farm workers in check" [Bardhan 1984]. Bardhan not only finds attached labour functional for the modern capitalist form of agriculture but also claims that attached labourers enjoyed superior status compared to their counterpart casual daily wagers.

Rudra too contends that working for a specific employer on continuous basis does not necessarily imply semi-feudal relations. He argues that the semi-attached workers in Bengal enjoyed much better economic conditions than daily labourers while paying no cost in terms of their freedom [Rudra 1987: 858-59]. He goes to the extent of comparing the working conditions of attached labourers (not being free to leave the employer) with those employed in the organised sector/government jobs [Rudra 1990: 260]. Bhalla had also claimed that the attached labourers ('naukars') in Haryana received better wages than the casual labourers and they generally came from marginalised land-owning households while the casual labourers often belonged to landless lower castes. This 'privileged' position kept the attached labourers at a distance from the casual labourers belonging to menial castes in their attempt to mobilise agricultural labourers for higher wages [Bhalla 1976: A-28]. Bhalla, Bardhan and Rudra seem to agree with Byres who had expected that shift towards capitalist agriculture was likely to generate a new demand for attached labour. Far from stressing on the elements of unfreedom in the system, Byres had called the attached labourers a 'privileged class' who "to a certain extent, will participate in the prosperity of the green revolution" [Byres 1972: 105, 109].

In a recent article, Brass has contested the claims made by Breman, Bardhan and Rudra and has strongly argued against their theoretical formulations that try to provide positive conceptualisations of attached labour and consequently eliminate the elements of unfreedom in the relationship. He contests the validity of their central assumption, i e, voluntarity on the part of the labourer to join the relationship. "While the recruitment may itself be voluntary, in the sense that the labourer willingly offers himself for work, it does not follow that the production relations will be correspondingly free in terms of the worker's capacity to re-enter the labour market" [Brass 1991: 55, foot note No 2]. In contrast, he argues that "long- or short-term worker attachment is a form of unfreedom, the object of which is to discipline (not habituate), control, and cheapen labour-power by preventing or curtailing both its commodification and the growth of a specifically proletarian consciousness. At a general level the existence of attached labour cannot be understood without regard to the

class decomposition/recomposition (or restructuring) that accompanies class struggle, a process which ...amounts to the deproletarianisation of agricultural labour" [Brass 1991: 37].

In the labour abundance region of Tamil Nadu, Harriss observed the unfreedom of labourers being still institutionalised through the ideology of patronage which created a comparable effect, i e, the recreation of a supposedly traditional institution in order to extend control over the agricultural labour process [Harriss 1992: 208]. Similar view has been expressed by Ramachandran in his study [Ramachandran 1990].

II
The Argument

Based on an intensive field study of three villages of a developed district (Karnal) of Haryana,[1] this paper contends the following:

(i) Far from being a 'privileged class', attached labourers are perhaps the most deprived category in the agrarian society of Haryana today. They are more indebted than their counterpart casual labourers, they have more difficult working conditions and most of them strongly dislike working as attached labourers.

(ii) Even though there was no case of intergenerational bondages or generational debt transfers and, as such, the labourers entered the contract voluntarily, the elements of unfreedom were quite obvious in the relationship. Unless there was a serious compulsion, rarely did any labourer want to work as an attached labourer. The compulsions always arose out of a need for credit, required, in most cases, for weddings in the family, house repairs, illness or at times even for consumption Attached labour functioned more as a labour mortgage system for interest free credit rather than a subsistence guarantee arrangement.

(iii) Though Brass seems to be right when he says that attached labour is an unfree relationship, it is difficult to sustain his argument when he claims that there is a process of deproletarianisation of agricultural labour along with capitalist development in Haryana agriculture. Brass seems to function in a rather closed system of the agrarian structure. There are several factors that work against the kind of process that Brass has envisaged. First, labourers clearly have negative preference for attached labour and they strongly dislike the "loss of freedom" involved in working as attached labourers. Not only that, they try to mobilise all possible resources to come out of the relationship and some of them do succeed. The average number of years a labourer worked as attached labourer seems to be coming down. Second, there has been a significant change in the power structure at the local and the regional level that, to some extent, had eroded the dominance of the landowning caste/class over the 'low caste' labourers.[2] This has also been accompanied by a nearly complete erosion of the ideology of patronage and loyalty. In the absence of a viable source of legitimising the dominant-subordinate relationships, tensions and conflicts have multiplied among the farmers and attached labourers. Third, development of capitalism has also meant growth of communication networks and linkages to the urban centres which provide opportunities to the landless to find employment outside the village.

All this is leading to a decline in the system. The number of labourers available for attached labour has been decreasing.

III
Attached Labour in Haryana: Historical Context

As in other parts of the country, agrarian structure of Haryana was marked by dependency relations between absentee landowners and cultivating tenants and attached labourer. These unequal relations were sustained partly by the ideology of patronage and partly through perpetual indebtedness of the landless and tenant tillers. The system of attached labour was locally known as the 'sajhi' or 'siri' system.[3] A 'sajhi' generally worked on a plot of or on the entire land of the landowner and received a share from the total farm yield.

'Sajhis' were generally employed by the Rajput landlords who did not touch the plough. Employment of sajhis became more generalised during early 20th century with expansion of production and growth of rich peasantry in the region [Bhattacharya 1985: 123-25]. 'Sajhis' were almost always indebted to the landlords they worked with. Occupation of agricultural labour being associated with 'Kamins' (the untouchable) most of the attached labourers came from menial castes

Agrarian changes during post-independence period brought about significant changes in the agrarian social structure and the system of attached labour. Though attachment *per se* continues, it has undergone formal as well as substantive changes. In her study in early 1970s, Bhalla observed a gradual shift from keeping 'sajhis' on share basis to employing 'naukars' on a fixed annual wage. A significant change that she observed was the institutionalisation of formalised contract system where the mode of payment, its periodicity, duration of contract and advances to be made were all entered in the landlord's account book and the agreement was formalised in presence of three witnesses. A practice of advance payment of wages was built into the system [Bhalla 1976: A-25]. Bhalla had also reported that 'sajhis' continued to be a significant sub-category of the permanent labour class.

In the late 1980s, when I conducted field study in three villages of Haryana, there were no 'sajhis' working in two of the three villages. There were two labourers working as 'sajhis' in the third village but both were rather peculiar cases. One of them was a migrant from a less developed district of the state and in the other case the landowner was physically disabled.

What brought about the change? Perhaps the most important factor was increase in productivity of land following the introduction of HYV seeds, chemical fertilisers and mechanisation.

The big landowners, who earlier leased out their land to tenants or employed attached labourers on share basis, were the first to adopt the green revolution technology. This led to a shift to self-cultivation. Tractors and other machines made it possible to manage a much bigger operational holding. New technology also brought in multiple cropping systems. Net impact of the changes was a manifold increase in the productivity of land.

Keeping 'sajhis' on share basis meant sharing benefits of the new technology with the labourers. Farmers had become too calculative to find the old system economically desirable. Initially the form of the relationship remained the same but share of the 'sajhis' came down from one-fifth to one-fourteenth or in some cases to one-sixteenth—depending upon the operational holding of the farmer. This arrangement, however, could not last for very long.

In the old system, a 'sajhi' also shared expenses on the crop. Mechanisation increased inputs and overall expenses on land multiplied. Seeds, fertilisers, pesticides and diesel, etc, had all to be bought from the market. The accounts of these expenses were obviously kept by the farmers. Labourers often complained that farmers manipulated accounts. And in cases of crop failures, the 'sajhis' were made to share the expenses but they received nothing if the farmer got any "compensation" money from the government Consequently, tensions mounted and labourers themselves wanted a more formalised system. Now most of them preferred working as 'naukars'.

IV
Attached Labour in Study Villages

Out of the total 75 case studies of agricultural labourers, 30 were currently working as attached labourers and among the other 45 'casual labourers', 26 were those who had worked as 'naukars' or 'sajhis' for some time in their career. So, out of the 75 case studies, as many as 56 or nearly 75 per cent were either working as attached labourers or were ex-attached labourers.

Working life of an attached labourer started quite early. Most of them (48 out of 75 respondents, i e, 64 per cent) had started their regular working life before they were 15 years of age. There were only six labourers who reported that they started working

regularly after they were 18 years of age. Many of them started their career as 'palis' (herdsmen).[4]

For a deeper understanding of the phenomenon it may be relevant to raise questions regarding the working conditions of attached labourers, their perceptions on different aspects of attached labour, such as, why did a labourer choose to work as attached labourer? Was it out of compulsion or preference that made a labourer work as attached labourer? Was it possible for a labourer to come out of the attachment if he so desired? What was the extent of their indebtedness; what were their sources of credit and did their indebtedness lead to prolonged and compulsive attachments which can be described as conditions of 'semi-bondage'.

Why Did They Work as Attached Labourers?

It is interesting to note that only rarely did a landless labourer prefer working as attached labourer. Among both the categories of labourers—attached and casual workers—perceptions on attached labour were quite negative. Out of 75 labourers, only nine preferred attached labour over casual labour. As many as 60 (80 per cent) preferred working as casual labourers. Out of these 60, 22 saw attached labour as bad as 'bondage' where labourer was left with no freedom. One of the respondents said, "Working as 'naukar' is like being wife of the farmer over whose body the farmer has complete control".

Working conditions of an attached labourer are much more difficult than those of a casual labourer. He is committed to his farmer for almost 24 hours of the day. On an average an attached labourer works 10 to 14 hours in a day even during lean seasons. The burden of work further increases during peak seasons. Only in a few cases were they entitled to a few days off in a year.[5] Monetarily also a casual labourer could earn as much as an attached labour did and in some cases even more. And most importantly, labourers were not only aware of this fact but also felt strongly about it. So, obviously, labourers worked as attached labourers only under some compulsions and the immediate compulsion in almost all the cases was a need for credit.[6]

Getting credit from the local informal credit market is quite difficult for an agricultural labourer. It is more difficult when they need more than a few hundred rupees. They hardly have any access to institutional credit, particularly for the kinds of needs they have, and they cannot get credit from informal sources without offering collateral security which they rarely possess. Even if a labourer can manage it, the interest rates are very high (ranging between 2 and 5 per cent monthly).

So, the only viable source available to the landless labourers in the rural society are the big farmers and the only way that a labourer can mobilise credit is through mortgaging his labour power by accepting to work as attached labourer.

The most attractive element in attached labour system is the interest-free advance payment of the annual wage. In most cases the annual wage itself took care of the immediate credit needs of the labourer. And if he needed more credit he could get from the farmer on a monthly interest of 2 per cent.[7]

And interestingly the farmers who had been advancing credit on regular basis also reported that they advanced to landless mainly with the intention of tying them for attached or peak season labour.[8]

Need for Credit

Though the landless needed credit for various purposes, critical situations arose when there was a wedding in the family, or a house needed to be renovated or when a family member had to be treated for a serious and prolonged illness. They could easily get small amounts of credit required for consumption needs or for visiting a relative in a nearby village/town from petty shopkeepers or big farmers. Petty shopkeepers advanced to get regular customers or earning interest, the farmers lent with a hope that labourer would work for them during the peak season when there is a scarcity of labour in the village. However, when the need was a few thousand rupees, the only way they could mobilise cash was through mortgaging labour power, i e, accepting to work as attached labourers. Among the 56 respondents who were either working or had been attached labourers at some time in their career as many as 26 reported that they needed cash for their weddings and another 24 required money either to renovate/construct a house or clear off the debt availed for the purpose. There was only one among those working as attached labourers who reported that he had no such compulsion and had not borrowed anything in advance from the farmer.

Attached labourers were not only the most critically indebted category in the study villages, their sources were also generally local-informal where rates of interest are much higher than the institutional sources. Their access to institutional sources was almost negligible.

As shown in Table 1, standing average informal debt of the attached labourers was the highest. And on an average only 12.1 per cent of their total outstanding debt had been borrowed from institutional sources.[9]

At the other extreme, though the middle and big/very big farmers were also indebted, more than 75 per cent of their standing debt was from institutional sources which also implied that they borrowed mainly for productive investments—to buy a tractor or install a tubewell on the farm.

Compulsions and Continuities

Perhaps the most contentious issue in the discussions on attached labour has been the elements of compulsions and continuities in the relationship. It is not only the extent of continuity that is important, the ability of attached labourer to come out of the relationship if he so desires, is also crucial.

Table 1: Average Indebtedness to Institutional and Informal Sources of the Various Categories of the Respondents

(Rs)

Category	Standing Average Institutional Debt	Standing Average Informal Debt	Average Standing Debt
Attached labourers	797	5,787	6,584
	(12.1)	(87.9)	(100)
Casual labourers	2,111	3,024	5,135
	(41.1)	(58.9)	(100)
Small and marginal farmers (less than 5 acres)	2,162	5,649	7,811
	(27.7)	(72.3)	(100)
Middle farmers (5 to 10 acres)	12,773	4,000	16,773
	(76.2)	(23.8)	(100)
Big farmers (10 to 25 acres)	14,774	4,871	19,645
	(75.2)	(24.8)	(100)
Very big farmers (more than 25 acres)	15,500	2,100	17,600
	(88.1)	(11.9)	(100)
All respondents	6,745	4,323	11,068
	(60.9)	(39.1)	(100)

Table 2: Villagewise Information about the Number of Years Worked as Attached Labourers (All Respondent Labourers)

Village	Less than 5 Years	5 to 9 Years	10 to 14 Years	15 to 19 Years	20 Plus	Never	Total Years
I	4	6	3	2	2	8	25
II	3	6	5	2	4	7	27
III	4	3	5	3	4	4	23
Total	11	15	13	7	10	19	75

Though a significant proportion of casual labourers interviewed (26 out of 40) had worked as attached labourer and the fact that they were presently working as casual labourer implied that many did manage to come out of the relationship, the element of continuity was also not insignificant. Most of those who once entered attachment had to work as attached labourers for considerable number of years (Table 2). Those who had worked/were working for more than five years were as many as 45 out of the total of 56 respondents in the category (80 per cent). And those who had worked/were working for more than 10 years were 25 (45 per cent). There were 10 of them who had worked/working for more than 20 years as attached labourers.[10] This obviously reflects a significant continuity in the relationship.

Considering the fact that a large majority of labourers perceived attached labour negatively and did not prefer working as attached labourers, the continuity obviously implies compulsions. And as mentioned above, compulsions always arose out of a need for credit to finance a wedding, house repair or illness in the family.

Since the annual wage received in advance is required for a special need, the labourer had to keep borrowing from the farmer for his regular consumption and social needs throughout the contract year. By the time the contract year ended, the labourer had a substantial outstanding debt to the farmer. Since he had no alternative source of income or credit, he had no choice but to continue working as attached labourer with the same farmer or with another farmer who agreed to advance enough money to clear off the outstanding debt of the previous farmer.

Conflicts and Emerging Patterns

Though the picture presented above does seem to suggest that the existing attachment relations in Haryana agriculture are very close to what may be described as debt bondage, there are also counter tendencies.

Labourers have been increasingly becoming conscious of the difficult working conditions of attached labour. This is also reflected in their strong negative perceptions on attached labour. The fact that many of them reported that they chose to work as attached labourers only under compulsions, makes a lot of difference. The ideology of patronage and loyalty has largely been eroded from the minds of agricultural labourers. All this has led to mounting of tensions between labourers and the employer farmers.

Big farmers often abused their attached labourers in the informal chats among themselves. During group interviews also they expressed dissatisfaction and anger against the labourers. They said they could no more trust the labourers. Some of them reported that when a labourer was left alone in the field he would often let his castemen cut fodder from the farm. Since the two came from completely different caste groups, the divisions between labourers and farmers were very sharp.

Views expressed by labourers in similar group interviews conducted in their caste 'mohallas' were even more bitter. While farmers abused labourers for not working to their satisfaction, labourers expressed their discontent by calling them cheats and exploiters. They often got angry during the interviews and tried to tell how oppressive the farmers were. Narrating the story of a fellow labourer, one of them reported:

> All big farmers are cheats. They are extremely selfish. Dina, a big zamindar had employed Joga Jhimmar as an attached labourer. He also gave five acres of land for sharecropping paddy to Joga's father. Joga, once, cleaning the canal by chance cut a few plants of paddy. Dina on noticing it, became furious and slapped Joga. In reaction Joga refused to continue working with the 'zamindar'. Dina is so shameless that he took away the five acre land shared-out to his father without paying anything for the labour Joga's father had put in the crop.

In village III an attached labourer had temporarily left the farmer because he had been badly abused by the farmer. During a detailed interview, he expressed his anger against the big farmers. As he said: "...this whole 'kaum' is that of cheats. They suck our blood." When asked, whether by 'kaum' he meant caste of the farmer with whom he was working, he replied: "No, all these 'zamindars' (implying the class of big farmers)".

Cases of scuffles and physical fights particularly between attached labourers and big farmers were reported to be becoming frequent. At least three such cases in village I and two each in village II and III were reported to have occurred in the recent past. And there were at least five cases where the labourers were either absconding with a debt outstanding to the farmers or they were staying in the village but had refused to repay the amount. Some cases of physical fights between farmers and labourers were even taken to the police and labour courts by the labourers.

One of the consequences of these growing tensions was a tendency among the labourers, to some extent also desired by their employer farmers, to shift from one farmer to another after every one to two years. Out of the 30 respondent attached labourers, in 10 cases, it was their first year and in another 11 cases it was their second year with the farmer they were working with at the time of the field study. There were only three cases where the labourers were working with a specific farmer for more than five years.

When asked whether it would be possible for them to stop working with their employer farmer after the completion of the year, 28 out of 30 respondents replied in the affirmative. There was only one respondent who said that unless his debt was cleared, he would not be able to leave his farmer. Another reported that it would be difficult for him to arrange the amount which would have to be returned to the farmer before he could leave.

However, as stated above, most of them had borrowed more than their annual wages and those who had borrowed only up to their annual wage or less than that were likely to borrow more before the end of the year. This meant that only rarely was a labourer without debt at the time of completion of his contract year. How did they return the standing amount if they chose to stop working with the farmer? Out of 28 respondents who felt that they could easily stop working with the present employer, in 18 cases, they reported that they could borrow the amount from some other farmer and shift to him. So in these cases, the attachment *per se* continued. In eight other cases, the labourers reported that they could either borrow from a petty moneylender/shopkeeper and return the amount, or felt that it would not be compulsory for them to clear their debt at once if they did not want to work with the farmer next year. They could gradually return the amount with interest. The remaining four were sure that they would not be indebted to the farmer at the end of the contract year.[11]

Bhalla in her study of 'New Relations of Production in Haryana Agriculture' conducted in early 70s, had found that the attached labourers ('naukars') came from marginalised landowning households while the casual labourers came generally from the menial castes. This also divided the labourers [Bhalla 1976: A-28]. The present study contradicts Bhalla's findings. Except for three, all attached labourers interviewed belonged to menial castes. Same was the case with casual labourers. She also reported that when the contract was signed between the 'naukar' and the farmer, the latter sought at least three witnesses who often were the ones who had position of power and authority in the village and could evoke feelings of submission and obedience from the labourer. This, in her view, reflected "on the relations of power in Haryana village... The witnesses are all presumed by the villagers to stand on the side of the hirer, and that no case was found where a witness was included who was considered a representative for the labourer" [Bhalla 1976: A-26]

The picture observed in the three study villages was again very different. Out of 30 respondent attached labourers, not in all cases was a contract signed. In nine cases, the contract was oral. In another four cases, where contract was signed, no witnesses were sought. In rest of the cases generally a single witness was taken who always came from the caste of the labourer—usually his

relative. This also reflected an erosion in authority of traditionally dominant sections. The farmers preferred a witness who could put social pressure on the labourer in cases of default.[12]

V
Conclusions

Discussions on the phenomenon of attached labour in the post-green revolution agriculture have ranged from characterising attached labourers as 'privileged class' to 'unfree slaves'. The field data and the discussion presented above makes it abundantly clear that attached labourers neither enjoyed the kind of status that made them privileged among the poor nor did they see their position as being so. Attached labour functioned more as a labour mortgage system where the labourer, in some sense, had to give up his freedom in order to avail an interest free credit. Implications of such an argument are many. Though it is a voluntary arrangement, in the sense that labourer chooses to enter the relationship, it cannot be compared with employment in the organised sector as has been argued by Rudra. Here the labourer is compelled to choose an alternative that he not only dislikes but also finds economically less rewarding. And the source of his compulsion lies in his weak economic position. Hence, the indebtedness and consequent compulsion to continue working as attached labourer does imply that there are elements of dependency and unfreedom in the relationship.

This, however, should not lead to the conclusion that nothing has changed as far as dependency relations are concerned. There has not only been a formal change in the system of attached labour, substantially also the relationship has changed considerably. Development of capitalism in agriculture has been accompanied by a near total erosion of the ideology of patronage and loyalty. This also has eroded the unquestioned power of the dominant castes and landlords in the rural society. And the growing integration of rural society into the broader national economy has meant opening up of possibilities of employment outside agriculture and the village.

These changes have also created tensions and conflicts in the relationship. Growing dislike for the relationship has made them try to mobilise alternative sources of credit and come out of the relationship as soon as they could. These ranged from dependence on wife's employment/earnings for subsistence needs of the family and minimising borrowings more than the annual wage from the farmers to utilising the money received under IRDP schemes to clear off the outstanding debt and defaulting the bank loan. Despite the compulsions and continuities, it was difficult to identify a process of deproletarianisation as argued by Brass. On the contrary, there was sufficient evidence to suggest that the phenomenon of attached labour was on a decline. Though no quantitative evidence could be gathered, the impressions and opinions expressed by farmers and labourer respondents confirmed it. And this was mainly because of growing reluctance on the part of the labourers to work as attached labourers.

Notes

[I am grateful to D N Dhanagare and P N Pimpley for their comments on an earlier draft of this paper. Errors and omissions are obviously mine.]

1 This paper is a part of a broader study of agrarian change and debt dependency in Haryana agriculture. Field work for study was conducted in three medium size villages of an agriculturally developed district (Karnal) of Haryana. The field work was carried out during 1988-89 over a period of six months. Apart from observations and interviews with various people, 185 case studies of farmers and labourers representing different categories were conducted [see Jodhka 1990].

2 In a recent article, Mendelsohn has argued on more or less similar lines. His argument is based on a field study of Rajasthan. See, Mendelsohn (1993).

3 'Sajhu/siri' literally means a partner or sharer. However, it is used only for the landless labourer and never for the farmer.

4 A 'pali' is usually a child labourer between 12 and 17 or 18 years of age or an aged labourer, who is unable to work as a regular casual or attached labourer. When a labourer is 17 or 18 years old, he starts working as a regular labourer—casual or attached. A 'pali' is always paid less than a 'naukar'. A 'naukar' received an annual wage ranging from Rs 3,500 to Rs 5,000 plus meals or a fixed amount of wheat, a 'pali' got meals and an annual wage ranging between Rs 1,000 and Rs 2,000 depending primarily on his age.

The number of those who started their working life as 'palis' was more among the attached labourers (20 out of 30 respondents in the category) than the casual labourer respondents (14 out of 45).

5 Out of 30 attached labourer respondents only 12 reported that they could avail leave up to 12 days in a year. This was written in the contract. In rest of the cases the labourer had to either give a replacement or had to forgo wage of the day.

6 Out of 30 attached labourers only 7 reported that they worked as attached labourers because it offered regular employment and better wages. Rest all reported that they needed credit for wedding (11), house repair (3), to clear off another standing debt (7) or for consumption (2).

7 Twenty-eight out of 30 respondent attached labourers reported that they could easily get advances more than the annual wage from their employers. The other two said they could get only up to the annual wage. This was the single most important attraction for a labourer to accept attached labour.

8 Among the 58 farmers out of the 110 interviewed who regularly lent out a part of their surplus in the local informal credit market, as many as 41 reported that they lent either exclusively to tie labour (23) or with the dual purpose of earning interest and also tying labour (18).

9 In most cases, the institution loan meant the outstanding loaned amount received under an IRDP scheme. Same is true of casual labourers' institutional debt.

10 It may be important to note that a labourer rarely could get employment after the age of 50 to 55 and he starts working at the age of 18 or 20. So the total working life of a labourer is around 30 to 35 years.

11 Two important sources used by labourers to come out of attachment were, first the IRDP schemes where the labourer utilised the money for clearing off the debt in place of buying an asset and second, depending on wife's casual labour income for daily expense of the family and minimising borrowings from the farmer.

Economic Diversification in Rural Areas

Review of Processes with Special Reference to Gujarat

Rakesh Basant

Recent evidence of diversification of rural employment structure away from agriculture has generated interest among researchers. This article examines the determinants of rural non-agricultural activities in Gujarat within the wider perspective of other salient changes at the macro level.

INSOFAR as economic development involves a process of specialisation and diversification, a decline in the share of the agricultural workforce and an increase in non-agricultural employment is only to be expected. There can be some cause for concern if economic diversification in rural areas is a result of a sustained squeezing of labour from the agricultural sector, rather than as a response to a vigorously growing non-agricultural sector. Of course, at a point in time both types of processes may be at work. However, the dominant forces need to be identified.

The identification of the dominant forces at work is a complex and difficult task. The analytical difficulties mainly arise from the simultaneous operation of a variety of 'push' and 'pull' factors determining the size of the rural non-agricultural sector. Since time-series data are not available and interpretation is essentially based on a few point-of-time estimates, a variety of transient factors confound the relationships under study. Given the complexity of the processes at work, any inferences drawn on the basis of available data can only be tentative. Besides, there are likely to be significant regional variations in the nature and dynamics of the emerging rural non-agricultural sector. The major findings of our research summarised below have to be seen in this context.

Section I briefly outlines various diversification processes at the conceptual level. The growth of the rural non-agricultural sector is viewed here as one of the many interesting changes that have taken place in the last two decades. The findings of the GIDR study are summarised in Section II within the wider perspective of other salient changes at the macro level. To the extent possible, an effort is also made to compare and complement these findings with the results of other studies. The final section lists some areas for further research.

I
Processes of Diversification: Some Hypotheses

Economic diversification in rural areas is one aspect of the macro-economic changes taking place in the economy as a whole. Consequently, many factors which influence such diversification may originate outside the rural location. To encompass the wide variety of influences, the distinction made by Saith (1991) between alternative approaches to rural diversification/industrialisation is useful. The location approach defines rural industry by its location in a designated rural area. This approach views rural industrialisation as a policy instrument to reduce urban industrial concentration. Through specific government policies, the relocation of urban industries to rural centres is encouraged, as is the establishment of new industrial enterprises in rural areas.

The alternative linkage approach to rural industrialisation views the rural non-agricultural sector from the rural end. The key criterion for defining an industrial enterprise or any other economic activity as 'rural' is whether it generates significant development linkages with the rural sector [Saith 1991: 464]. These forward and backward linkages can take the form of capital and labour flows, production linkages for inputs and outputs for agriculture and consumption linkages generating demand and supply for a variety of goods and services.

Most studies have focused, directly, or indirectly, on the linkage approach to analyse rural diversification processes. However, industrial location policies may have played an important role as well, at least in certain areas. Combining the two approaches, four categories of economic activities can be defined (Saith 1992): (a) Rural located, rural linked (Rloc-Rlink); (b) Rural located, urban linked (Rloc-Ulink); (c) Urban located, rural linked (Uloc-Rlink); and (d) Urban located, urban linked (Uloc-Ulink). Obviously, these categories do not form watertight compartments and a lot of overlap is expected. The categories help to highlight analytical and policy issues. The three categories connected through location or linkage with rural areas cover a wide variety of activities and enterprises. What generates and sustains such activities and enterprises is the basic analytical and policy issue.

Diversification Induced by Agricultural Growth

The relationship between agriculture and rural non-agricultural activities is perhaps the most important in understanding the Rloc-Rlink category of non-agricultural activities. The linkages between agriculture and industry have always been a subject of economic theorising, especially the issue of resource transfer across sectors and its role in economic development. The rural-urban dichotomy was not very crucial to these formulations; the major focus being on sectoral linkages. Some recent theoretical studies have brought in the locational dimension more explicitly into the analysis [e g, Ranis and Stewart 1993]. In most of these theories agriculture was seen to play a subsidiary role; a source of mobilising surpluses of food and raw materials, labour and savings for financing industrial growth (Rutten, 1991).

Mellor (1976) put agriculture on centre stage and argued that rapid growth in agricultural production, through effects of linkages with non-agriculture, can stimulate expansion of productive and employment-intensive, small scale rural industrialisation. The logic is that increased food production, based on cost decreasing "green revolution' technology, results in a large net increase in national income. If this income accrues to relatively large farmers, who do not spend the entire additional amount on foodgrain consumption or on capital or import-intensive commodities, the demand for local non-agricultural goods and services will be stimulated. Thus, increased agricultural production by the wealthier landowning classes will generate demand for non-agricultural production of a labour-intensive variety. Growth of such non-agricultural consumption expenditure was seen by Mellor as the main driving force behind rural diversification. However, he also envisaged the possibilities of productive reinvestment of agricultural surpluses by large commercial farmers to take advantage of the rural non-agricultural investment opportunities that were created by increased demand.

What Mellor envisaged, therefore, was the possibility of endogenous, demand-led growth in a green revolution area, derived from its increased prosperity and driven on by the higher levels of rural (consumption) expenditure [Dunham 1991: 2]. Following Dunham (1991: 2-3), the mechanics of this process generated through income additions induced by agricultural growth can be outlined by five testable hypotheses.

(1) The increased demand of large commercial farmers is crucial for the subsequent expansion of non-agricultural activities.
(2) Consumption linkages are more important than production linkages.
(3) The additional incomes generate a demand for labour-intensive goods and services that can be locally produced on a small-scale basis.
(4) The savings of these wealthy households are an important source of investment in non-farm activities.
(5) The indirect effects from agricultural growth will be effective in generating employment, mopping off rural surplus labour and reducing rural poverty

Apart from the possibility, discussed later, that the rural enterprises are of the Rlock-Ulink variety, there can be other reasons for the absence of a monotonic relationship between agricultural growth and rural non-agricultural sector. On the basis of some data from West Bengal, Chandrasekhar (1993: 245-46) describes three likely phases of this relationship. In the pre-Green Revolution era, there is some local demand for the products of primitive manufacturing, repair, personal services and minor trading requiring little investment. The share of non-agricultural workers is low. Subsequently, as a region enters the early Green Revolution phase, the increased demand for labour in agriculture and the wage levels in agricultural activities may reduce the elasticity of labour demand in the non-agricultural sector. While the demand for supportive non-agricultural activities will also increase in rural areas with more productive agriculture, the net result may be a shift of workers into agriculture. Finally, as the agricultural sector matures, attaining higher levels of per hectare and per capita productivity, the increased demand for more specialised higher quality goods and services would raise the share of non-agricultural employment in total rural employment, especially if it is accompanied by lower elasticity of labour demand with respect to agricultural output. Some of this demand may also be met by activities located in urban areas. More on this later. Such a scenario results in an inverted U-shaped 'time profile' when cross-section data on per capita output (X-axis) and share of non-agricultural employment (Y-axis) are plotted. The available evidence from other sources suggests that the U-shaped relationship is not generalisable. Some of this evidence is discussed in the next section.

Distress-diversification can also vitiate the relationship between agricultural growth and economic diversification in rural areas. Lack of agricultural growth means that rural workers who are not absorbed fully in agriculture are forced to undertake unproductive non-agricultural activities [Vaidyanathan 1986]. Such participation in non-agricultural activities is seen as a survival strategy of poor households with under and unemployed labour.

> Such a strategy involves a joint pattern of activity on the part of several households involving seasonal and technological dovetailing of multiple occupations, most of which are practised at exceedingly low levels of productivity. The poor substitute for their missing capital by expending disproportionately large quantities of their labour, thus accepting an implicit wage rate (for artisanal or domestic production work) which is often well below the wage rate in the casual agricultural labour market... and often below what could be deemed a poverty line wage rate... On account of the very low levels of labour productivity (for technological or labour market reasons), poor peasant households... which are working exceptionally long hours on a regular basis in their multiple non-farm occupational pursuits might still be classified income-unemployed since they are still unable to make up a subsistence level of income [Saith 1991: 470].

The interpretation of data on unemployment to discern distress, therefore, is problematic once poor workers have spilled into non-agricultural pursuits. Besides, while self-employment can conceal under-employment in a non-viable enterprise, wage labour in non-agriculture is unlikely to be a low productivity-employment stretching activity, the latter having an implicit capitalist basis. Of course, the productivity or relative earnings from rural non-agricultural activities will reflect the 'distress' or 'growth' orientation of these activities. Further, distress diversification might not necessarily take place into non-agriculture and there can be other strategies for survival as well. These strategic choices get reflected in work participation rates, number of activities per household/worker and composition of these activities. These issues are discussed in some detail later

Rural Urban Interface

As mentioned above, it is being increasingly recognised that the employment linkages generated by investments in urban areas could be stronger than those from agriculture. Besides, even under good agricultural growth scenario an important component of increased aggregate demand can come from urban growth [Dunham 1991: Hariss 1987]. Alternatively, in the mature phase of agricultural growth, rural demand for non-agricultural goods produced in urban areas may increase faster than for goods produced locally [Chandrasekhar 1993]. Rural-urban interface is therefore important and to view rural areas as bounded spaces may be analytically misleading [Basu and Kashyap 1992; Visaria and Basant 1994]. The Rloc-Ulink and Uloc-Rlink type of activities, therefore, gain significance.

Urbanisation can influence the growth of rural non-agricultural employment in various ways [Visaria and Basant 1994]:

(a) Over time, several rural localities are classified as towns although a few former towns get declassified. Also, the boundaries of cities are periodically extended to include the surrounding 'rural areas'. Such expansion of urban areas is likely to lead to an apparent decrease in the magnitude of rural non-agricultural activities. This is so because the share of the non-agricultural sector in those rural areas which get classified as urban is more than in other rural areas.
(b) Urbanisation and the associated improvements in infrastructure may render some rural non-agricultural activities, especially in the manufacturing sector, non-viable through the competition of better or less expensive substitutes.
(c) Urbanisation and the growth of infrastructure may expand the market for rural enterprises and encourage non-agricultural activities both in the secondary and tertiary sectors in the neighbouring rural areas to satisfy non-local demands. As noted above, such developments can encourage both local and non-local capital to flow into rural areas to exploit local resources for viable non-agricultural activities.
(d) Better and relatively inexpensive transport facilities make it possible for many members of rural households to shift to non-agricultural occupations without changing their residence through commutation.

The processes of urbanisation may have a differential impact on different types (secondary/tertiary) and forms (household/non-household) of non-agricultural activities. In an urbanised area, growth of agricultural productivity can encourage demand for

Table 1: Employment Elasticities with Respect to Value Added by Sectors of the Economy: 1972 to 1983

Sector	1972-73 to 1977-78	1977-78 to 1982-83	1972 to 1983
All sectors	0.51	0.41	0.47
Mining and quarrying	1.00	0.75	0.96
Manufacturing	0.80	0.61	0.68
a Unregistered	—	—	0.75

Agriculture and allied	0 40	0.28	0.35

Source: Papola (1990).

tertiary sector construction and repair services based in rural areas; while demand for manufactured goods may be met by the produce of urban areas. Also, different sized towns can influence the structure of the rural non-agricultural activities in a differential manner [Shukla 1994]. Therefore, the patterns of urbanisation in a region may play a very important role in determining rural-urban linkages. *Ceteris paribus*, a more equitable pattern of urbanisation will probably be more conducive to the growth of rural non-agricultural sector than a less equitable one. It will be argued later that decentralised urban development may have encouraged the growth of rural non-agricultural sector.

A Framework for Analysis

The analysis of primary data contained in the GIDR study [especially Basant 1994; Unni 1994], underlines a broad framework for analysing processes of economic diversification. In what follows we summarise the basic elements of this analytic. It needs to be emphasised at the outset that we still have a long way to go before we can adequately capture the complexity of these processes. The variety of linkages enumerated above constitute the socio-economic forces to which households respond, given their household characteristics. What gets reflected in aggregate statistics is the net outcome of the choices made by households regarding the nature and extent of their participation in economic activities.

The household is, therefore, seen as the basic decision-making unit for the allocation of family labour between various economic and non-economic activities. The available primary and secondary data, analysed extensively in the GIDR study, suggest that rural (as well as urban) households undertake, often simultaneously, a variety of agricultural and non-agricultural activities. Consequently, their participation in non-agricultural work cannot be adequately analysed without understanding the relation between the agricultural and non-agricultural activities.

Further, the available data also show significant inter-regional variations in the (i) worker population ratios; (ii) number of economic activities undertaken by a household or an individual and (iii) the composition of these activities. While analysing the survey data, it is emphasised [Basant 1994; Unni 1994] that the decisions about these variables are often taken simultaneously. A variety of factors which influence the supply and demand of labour affect these decisions. These are, therefore, seen as three interlinked components of economic diversification in rural households. Thus a shift towards non-agricultural activities is only one element of the diversification process envisaged above.

The nature of participation of household members in economic activities is influenced by their access to land and other human and physical assets and the amount of surplus they produce. It has already been argued that the emergence of non-agricultural work opportunities in rural areas itself depends upon the pace and process of accumulation in the village or regional economy. This, in turn, may be influenced by the growth in agricultural productivity, and consequent rise in income levels, availability of infrastructural facilities and links with urban areas. The nature and extent of the rural-urban linkages will depend on the dynamics of change in the nearby towns.

A preliminary effort is made to translate this heuristic framework into econometric terms in one of the chapters of the GIDR study [Unni 1994]. Decisions to participate in economic activities and the nature and number of such activities are analysed as a set of choices made by an individual, given the household and regional characteristics.

II
Processes of Diversification and Their Macro Context

Certain macro features of the Indian economy may provide a useful context to the analysis of changes in the nature and quantum of the rural non-agricultural sector in Gujarat and in India as a whole. These changes may also provide clues about the nature of linkages which have induced the generation of non-agricultural activities in rural areas. Most of the macro-trends noted below are based on discontinuous series of data. As mentioned above, inferences drawn from such a series need to take account of transient factors such as drought, impact of scarcity relief works, etc [Visaria and Minhas 1991]. Since the focus of our project was Gujarat, we try to identify the peculiarities of the state's macro-economic scenario *vis-a-vis* that of the country as a whole.

Various chapters in the GIDR study analyse a wide variety of issues and use data from different sources. This section summarises the major findings of the study and of some other related studies in the context of these macro-economic changes and relates them to our earlier discussion on the processes of economic diversification.

Composition of Rural Employment

Detailed analyses of NSS and census data highlight the following changes in the rural workforce. Unless stated otherwise, the patterns are the same for India and Gujarat. To save space, the relevant tables are not reported here; they are available in two chapters of the report [Basant and Kumar 1994a; Basant and Parthasarthy 1994a].

Table 2: Estimated Sectoral Employment Elasticities with Respect to Sectoral Gross Domestic Product

Sector	Period I 1972-73 to 1977-78	Period II 1977-78 to 1983	Period III 1983 to 1987-88
1 Agriculture	0.54	0.49	0.36
2 Mining	0.95	0.67	0.85
3 Manufacturing	1.05	0.68	0.26
4 Construction	0.35	1.00	1.00
5 Electricity, gas and water	1.67	0.74	0.48
6 Transport, storage and communications	0.76	0.92	0.35
7 Services	0.80	0.99	0.42
8 All sectors	0.61	0.55	0.38

(i) The share of rural non-agricultural sectors in the total rural workforce has increased. The trend is more clearly observed for male workers than for female workers. This trend was observed in all but three districts of Gujarat.

(ii) Overall, the bulk of the increase in the rural non-agricultural sector is explained by the increase in the proportion of casual non-agricultural workers; the increase in the share of the self-employed in non-agriculture has not been significant. The major shift was observed from self-employment in agriculture to non-agricultural activities, especially as casual workers.

(iii) Both secondary and tertiary sectors in rural areas have experienced relative growth. In India as a whole, the increase in the tertiary sector seems to be sharper than that in the secondary sector for male workers. For female workers in rural India and Gujarat, the patterns are not very clear. For male workers in Gujarat, the two sets of data showed divergent trends: the increase in the secondary sector was sharper according to the census data but smaller according to the NSS estimates. But overall, the secondary sector in rural Gujarat (especially manufacturing) has been more dynamic than in rural India as a whole. In most of the districts in Gujarat where the share of rural male workers has increased, the increase has been sharper in the secondary than in the tertiary sector.

(iv) Within the secondary sector in rural areas, manufacturing has increased according to both sets of data. However, while non-household manufacturing has grown, the share of the household sector has declined. In most districts of Gujarat, the increase in the share of non-household manufacturing has more than offset the decline in the share of household manufacturing. Significantly, the share of male non agricultural workers in the rural workforce has declined only in those three districts where the growth of non-household manufacturing was not significant enough to compensate for the decline in the household sector.

These macro-changes in the composition of the rural workforce form the background to our subsequent discussion on the nature of the diversification processes underway in rural areas, especially in Gujarat.

Agricultural Growth-Related Processes

The elasticity of employment with respect to production in Indian agriculture has experienced a decline [Tables 1 and 2, also see Bhalla 1989]. This decline is partly a result of productivity raising technological change. Besides, the use of 1987-88, a drought year, as the terminal year for the calculation of elasticities may generate a downward bias in these estimates. The decline in the employment elasticities was accompanied by an increase in the subdivision and fragmentation of holdings and in the casualisation of labour in rural areas. [Basu and Kashyap 1992; Basant and Kumar 1989]. These overall trends, however, conceal significant variations in the patterns at the regional level [see Bhalla 1989; 1990].

Gujarat, Maharashtra and Andhra Pradesh were the only states which experienced high rates of growth of labour absorption and labour productivity during the trienniums 1971-74 and 1981-84. In the case of Gujarat, almost the entire increase in agricultural employment during this period was due to increases in labour intensity per unit of land [Bhalla 1989, Tables 9 and 12]. Consequently, on an average, it is unlikely that workers were being pushed out of agriculture on any significant scale during the period when the share of non-agriculture in the rural workforce was on the rise. It needs to be mentioned, however, that marginalisation of landholdings has proceeded at a faster pace in Gujarat than in India as a whole during 1961-82 [Patel 1991:46] and the rates of casualisation have also been higher in rural Gujarat than in rural India. Part of the increase in the casual labour force was also a result of the severe drought during 1987-88 which forced self-employed cultivators to participate in scarcity relief works as casual workers

As argued earlier, casualisation of the workforce does not necessarily signify distress as casual non-agricultural workers may command higher earnings than agricultural workers. Papola (1992) has argued that unless the earnings in casual non-agricultural employment are adequate, persons self-employed in agriculture are unlikely to shift to such activities as the latter provides a safety-net for survival. We shall return to the issue of earnings later.

Overall, the empirical evidence on the relationship between agricultural growth and the development of rural non-agricultural sector is mixed. At the aggregate cross sectional (NSS regions) level, indices of agricultural development are positively related to the proportion of rural non-agricultural workers [Unni 1991]. However, the relationship is more significant if the share of rural non-agricultural workers is regressed on the per hectare agricultural productivity at the NSS regional level [Dev 1990; Unni 1991] and at the district level in UP and Maharashtra [Singh 1994; Shukla 1994]. Surprisingly, another indicator of rural prosperity, agricultural output per capita of agricultural workers, showed a significant positive relationship with the share of rural non-agricultural workers only at the state level [Vaidyanathan 1986] and not at the NSS regional level [Dev 1990; Unni 1991] and district levels [Jayraj 1994, Singh 1994]

Prima facie, agricultural productivity per capita is likely to be a better index of rural prosperity than productivity per hectare. The data however, seem to suggest, otherwise. Agricultural development may improve the

efficiency of the rural non-agricultural enterprises without necessarily increasing their number [Papola 1987]. Besides, to cross a threshold level of land productivity may be a necessary though not a sufficient condition for the emergence of growth induced non-agricultural sector [Kashyap and Desai 1990].

Bhalla (1993b) analyses these relationships at the district-level using the 1961, 1971 and 1981 census data for 274 districts. She did not find any evidence for 'attributing systematic causation from the side of agriculture-related growth rates', regardless of whether it is defined in terms of rates of growth of farm output or rates of growth of agricultural output per male agricultural workers [Bhalla 1993b: 432]. The inverted U-shaped formulation does not work either in terms of rates of growth or in the cross-section version for different years.

Analysis of the correlates of inter-regional variations in the share of rural non-agricultural workforce in the talukas and districts of Gujarat [Basant and Parthasarthy 1994b] brings out the complexity of the processes at work. Interestingly, none of the conventional explanatory variables except irrigation and to an extent urbanisation emerge as significant determinants of rural non-agricultural sector in Gujarat. Analysis of survey data at the village level [Basant 1994] also suggests weak links with agriculture of the rural non-agricultural sector.

Levels and growth of land productivity, per capita agricultural output, non-food crops, etc, are not significantly related to rural non-agricultural employment at the taluka and district level. This may imply that *ceteris paribus* growth of land productivity (or per capita output) based mainly on cropping pattern changes may not generate adequate impulses for the development of rural non-agricultural activity. It may be partly because the processing of output is likely to be concentrated in urban areas and the techniques of production may be capital-intensive. The stability provided by irrigation to levels and growth of output is perhaps crucial to generate viable and long-term opportunities for such diversification.

Two findings of Bhalla (1993b) are very revealing. First, low productivity districts have tended to become increasingly concentrated in agriculture, an indication that agricultural involution is the rule in poor districts, rather than distress diversification. Secondly, the influence of the urban centres on the workforce diversification in the surrounding countryside has been growing. Both these results are consistent with the findings of our survey. Analysis of primary data at the village levels suggests that except for scarcity relief work other non-agricultural activities were not primarily a result of distress diversification. Indeed, distress conditions, in the absence of a viable market for non-agricultural activities result in higher WPRs and higher number of activities per worker, most of which relate to agriculture [Basant 1994].

The evidence on consumption and production linkages, though meagre, is also mixed. While consumption linkages are found to be important in some areas [Haggblade Hazell and Brown 1989], production linkages played a more important role in others [Harriss 1987]. There is also some evidence that larger farmers invest their surpluses into non-agricultural activities, especially those relating to processing and trade [Rutten 1991; Harriss 1987; Hariss 1991; Basant and Joshi 1991]. But neither were such surpluses only invested in local industry nor did the money which came to rural industry come only from agriculture. Dunham (1991) after a review of various studies on this theme concludes that while agricultural growth may stimulate industrial expansion, it is not always local industry which benefits, and that when the industry is local, it is not necessarily small-scale, nor indeed labour-intensive.

At an aggregate level, participation in non-agricultural activities declines with a rise in size of landholding [Basant and Kumar 1989; 1994a]. The analysis of primary data at the individual level suggests that participation in non-agricultural activities increases in households with very large landholdings. This suggests that agricultural surplus is being reinvested in non-agricultural activities by these large landholders; a result consistent with Rutten's (1991) for parts of Gujarat.

The macro- and micro-level analysis, therefore, suggests that the linkages between rural non-agricultural activities and levels and growth of agricultural productivity in the regions of Gujarat have been weak. Apparently, extra-local links are important to satisfy the demands generated by agricultural growth. Consequently, Rloc-Ulink activities perhaps play a more dominant part than the Rloc-Rlink non-agricultural activities. The analysis of survey data at the village level [Basant 1994] also brings out the significant and positive influence of proximity to towns on rural non-agricultural activity. This takes us to the evidence on rural-urban linkages which impinge on activities categorised as Rloc-Ulink and Uloc-Rlink.

Urban Employment: Unorganised Sector

As in the case of agriculture, the elasticity of employment with respect to value added declined for most other sectors in India as a whole, during the period 1972-88. Construction and mining are the only two sectors where the elasticity of employment increased during this period (Tables 1 and 2). Significantly, within each non-agricultural sector, employment in the unorganised segment grew at a much faster pace than in the organised industry (Table 3). Apart from mining and quarrying, employment in unorganised construction and transport, etc, increased at a fast rate. Basant and Kumar (1994a) show that the share of these and most other non-agricultural sectors increased in both rural and urban areas, the increase being more significant in the rural areas. Therefore, the growth of the non-agricultural, especially tertiary, activities in both rural and urban areas seems to have taken place

Table 5: Share of the Unorganised Sector in Total Manufacturing Employment and Value Added

Sector	Share in Employment		Share in Value Added	
	1974-75	1984-85	1974-75	1984-85
Unorganised Sector	72.6	82.4	35.7	37.6

Table 6: Characteristics of Unorganised Manufacturing Enterprises: Some Estimates from 29th and 40th Round Data

Characteristics	Rural Areas		Urban Areas	
	1974-75	1984-85	1974-75	1984-85
Employment per enterprise	1.8	1.7	2.1	1.7
Value added per enterprise (Rs)	1,549	3,385	5,295	9,055
Output per enterprise (Rs)	2,565	6,159	12,600	17,862
Fixed assets per enterprise (Rs)	990	12,695	2,905	26,381
Value added per enterprise (Rs)	870	2,059	2,583	5,433
Percentage of part-time workers	29.9	14.5	10.2	8.5

Source: Same as in Table 4.

mainly in the informal sector. A trend increase in the informalisation of employment can be more clearly seen in the case of manufacturing sector for which more detailed data are available.

Table 4 shows that there has been a significant increase, especially during the early 1980s, in the number of unorganised enterprises engaged in manufacturing activities in both rural and urban areas. This increase can only partly be attributed to the likely under enumeration of unregistered enterprises in the 29th and 33rd rounds [see for details Basant and Kumar 1990a]. The number of unorganised enterprises increased by about 10.4 lakhs during the decade 1974-75 to 1984-85 (Table 4). As a result of this increase the share of the unorganised sector in total manufacturing employment increased from about 73 to 82 per cent—the maximum gains going to the rural unorganised sector. However the unorganised sector's share in the total value added in the manufacturing sector rose only marginally from about 36 to 38 per cent (Table 5).

It has been shown elsewhere that employment in modern industry groups is growing at the expense of traditional industries in rural areas and in small household industries in urban areas [see Bhalla 1993b, Papola 1992, Basant and Kumar 1990]. A detailed examination of the secondary data on the composition of rural manufacturing in Gujarat [Basant and Kumar 1994b] shows that in some traditional occupations and industries (e g, foodstuffs, leather products, etc) the non-household production has increased at the cost of household production. Within the household manufacturing sector while the traditional industries show a decline, the modern industries (electrical goods, etc) have grown. All constituents of the non-household manufacturing have grown. The increase, however, seems to be much sharper for modern industries as compared to traditional ones. The micro level analysis of artisanal production [Parthasarathy 1994] also suggests that some traditional artisan groups like potters, basket weavers, spinners and shoe makers face more difficult market conditions than carpenters and tailors who could diversify into products with growing demand. If the growth of casual non-agricultural workers observed earlier has taken place in the modern non-household manufacturing enterprises, it reflects positive forces.

Available evidence also shows that productivity levels of the unorganised sector units have improved during the decade 1974-75 to 1984-85 in both rural and urban areas. While the number of workers per enterprise and part time involvement have declined, value added per enterprise and worker and value of fixed assets per enterprise have increased during this period (Table 6). In fact, the value of fixed assets per enterprise has increased very sharply. This is somewhat surprising and needs to be probed. Overall, however, the growth of the informal sector does not seem to be primarily induced by distress. The units are probably kept small to avoid factory and other legislation.

Estimates of changes in employment in the unorganised manufacturing sector at the state level (Table 7) show that the bulk of the increase in this sector came from three states: Uttar Pradesh, West Bengal and Bihar. In fact, of the total increase of about 16.4 lakh in the number of workers, about 39 per cent (6.4 lakhs) had occurred in UP alone. The shares of West Bengal and Bihar were about 16 and 9 per cent respectively. Most of the increase in these and other states, except Andhra Pradesh and Tamil Nadu, took place in rural areas. The other states which show a relatively high increase in informal manufacturing sector are Tamil Nadu, Orissa and Andhra Pradesh. It is significant that Orissa, Bihar and parts of UP have had a bad agricultural growth profile [Bhalla 1990].

Surprisingly, the employment in the unregistered manufacturing sector declined in Gujarat in both rural and urban areas. Since employment in manufacturing increased in Gujarat during this period [Basant and Kumar 1994a], the increase was apparently concentrated in the organised sector. These trends for Gujarat are surprising because many textile mills in the state were closed during this period. The validity of these data needs to be assessed but a few interesting observations regarding the growth of the unregistered sector can be made:

(i) At the aggregate all India level, the unregistered segment seems to be growing faster than the registered segment for almost all sectors of the economy. Such informalisation of economic activity is taking place in both rural and urban areas.

(ii) The capital labour ratios and productivity levels in the unorganised manufacturing units have increased during the period in which this sector grew rapidly.

(iii) For the manufacturing sector, for which detailed data are available, the growth of the unregistered sector seems to be concentrated in a few states such as UP, West Bengal and Bihar. The reasons for this concentration need to be explored. The quality of data collected during the 29th Round (1974-75) may not be as good as in the subsequent surveys, as it was the first time when such data were collected.

TABLE 7: CHANGES IN EMPLOYMENT IN UNORGANISED MANUFACTURING: MAJOR STATES

(in Lakhs)

State	Change in Employment Between 1974-75 and 1984-85			Percentage Change in Workers
	Rural	Urban	Total	Rural + Urban

(iv) If growth of the unregistered segment within the manufacturing sector is any indication, the growth of the informal sector does not seem to be very significant in Gujarat in both rural and urban areas. Apparently, the processes which result in the growth of economic activity conducted on an informal basis are relatively weak in the state.

Patterns of Urbanisation

Lack of job opportunities in rural areas can result in rural-urban migration of job seekers. And such migration can result in higher levels of urbanisation. We have already noted an increase in the share of urban informal sector where such migrants are likely to find jobs. However, the extent to which such migration and the growth of urban informal sector is a result of distress conditions in rural and urban areas is difficult to ascertain. We have already indicated that the productivity levels in the unorganised manufacturing sector have increased along with the growth of this sector. We do not have information about the productivity changes in the unregistered units involved in tertiary activities.

The rate of urbanisation and the proportion of non-agricultural workers in rural areas are found to be positively related at the cross sectional level [Dev 1990; Unni 1991; Singh 1994; Jayaraj 1994]. We find similar evidence at the taluka level in Gujarat [Basant and Parthasarthy 1994b]. Evidently, the net impact of the processes associated with urbanisation is positive. However, the positive relationship does not hold when the change in the share of non-agricultural employment in rural areas was related to the change in the level of urbanisation [Singh 1994; Jayaraj 1994]. Analysis at the micro level brings out the complexity of the relationship between rural and urban areas.

The data show that urbanisation has slowed down during the 1980s [Visaria 1994; Mohan 1993]. It is possible that the policies to encourage the location of new industrial unit outside relatively large cities and other incentives to developed backward areas have contributed to the slowing down of the growth of urban employment opportunities. The tariff structure and labour laws may have also induced high capital-labour ratio in the registered manufacturing sector [Mohan 1993]. The stagnation in the registered sector employment has already been noted. While the validity of the estimates needs to be evaluated, capital-labour ratios seems to have increased within the unregistered manufactured sector (Table 6) even though employment growth in the sector has been significant.

However, growth of job opportunities within rural areas can reduce the flow of rural-urban migration. And, rural-based workers can commute to work in urban areas. A recent study shows that while the major factor contributing to urban growth is natural increase (about 59 per cent of total urban growth), the share of net rural-urban migration in the urban growth during 1981-91 was a little higher than during 1971-81. Yet, urbanisation has slowed down during the 1980s because (a) some decline in the pace of reclassification of localities from rural to urban; (b) a somewhat higher rate of natural increase in rural than in urban areas; and (c) an evident rising incidence of rural-urban commutation during the 1980s than earlier [Visaria 1994].

The pace of rural-urban migration increased during the 1980s despite the slowing down of urbanisation. Differentials in rural-urban levels of living continue to attract migrants to urban areas and this process was not arrested during the phase of stagnant employment growth in the urban formal sector and the expansion of the rural non-agricultural sector. Of course, the urban informal sector also has expanded rapidly during this period.

The evidence about commutation is very interesting as the locations of work and residence are being increasingly separated. The NSS 43rd Round, [see Chadha 1993, Table 10], data suggest that about 1.8 per cent of rural male workers commute to nearby towns to work; the percentage of such workers among females is much lower (0.2). The proportion of such workers among rural non-agricultural workers would be significantly higher as was found during our survey of Gujarat villages; about 25 per cent of male non-agricultural workers in our survey villages commuted to urban areas for work [Basant 1994].

Urbanisation and development of infrastructure, which often are complementary processes and occur simultaneously, do influence economic diversification in a variety of ways. The importance of rural-

urban linkages is brought out in various chapters of the GIDR study. One can argue that the nature of such linkages will be determined by the pattern of urbanisation. One important component of the urbanisation pattern is the size-structure of towns and the regional spread of these towns.

According to available evidence, the population of larger cities has not been growing faster than that of smaller towns [Visaria 1994; Mohan 1993]. However, there can be significant inter-regional variations in the distribution of urban population by size class of towns. The concentration of urban population in class I towns is significantly lower in Gujarat (50 per cent) than in India as a whole (60 per cent). Each category of smaller sized towns has a higher proportion of population in Gujarat than in India as a whole, class VI towns being the only exception (Table 8). The towns in Gujarat are also dispersed in different geographical locations. As mentioned earlier, the catalyst in the process of rural non-farm workforce development does not lie entirely in agriculture, or even in rural areas. Analysis of district level data suggests that certain cities have begun to emerge as focal points of diversification of the rural workforce [Bhalla 1993b; 1993c]. This certainly is true of Gujarat as various chapters in the GIDR study show and the urbanisation patterns in the state may have facilitated this process

Trends in Poverty and Unemployment Rates

Growth of rural non-agricultural employment has not been accompanied by increases in unemployment and poverty While the chronic rates of unemployment (usual status) have shown a marginal increase during 1972-88 for rural males the daily status unemployment rates had declined in the 1980s for both males and females in rural areas The unemployment rates in urban areas remained stable for males and fluctuated for females [Visaria and Minhas 1990].

Vaidyanathan (1986) observed a positive association at the state level between the level of unemployment rates and the incidence of rural non-agricultural employment after controlling for differences in per capita output and distribution of income The relationship persisted when over time (1977-83) changes in the share of non-agricultural employment were related to changes in unemployment rates. This evidence was interpreted to suggest that the growth of rural non-agricultural sector may be distress induced.

As indicated in the earlier section, the distress diversification hypothesis is difficult to test with such data. First, the conceptual problems make the interpretation of unemployment rates and changes in them extremely difficult (see for details Unni 1991). Besides, one observes only the ex-post phenomena, after all the adjustments have taken place. If unemployment-led distress forces persons to participate in non-agricultural activities, such participation itself reduces unemployment rate. Therefore, the balance of different processes weakens the positive relationship between unemployment rates and non-agricultural employment [Visaria and Basant 19[illegible] Besides, Vaidyanathan (1986) himself [illegible] noted that the ratio of non-agricultural to agricultural wage rates was not inversely related to the unemployment rate, a relationship implicit in the residual sector hypothesis. We shall revert to this issue of wage rates later.

The data on poverty also do not reflect increase in distress conditions in rural areas. The incidence of poverty in rural India has declined from 58.8 per cent in 1970-71 to 50.8 per cent in 1983 and 48.7 per cent in 1987-88. In the urban sector, the corresponding decline in poverty incidence was from 46 2 per cent (1970-71) to 39.7 per cent (1983) and to 37.8 per cent (1987-88) The absolute numbers of rural poor, however, increased during this period in India as a whole but declined in Gujarat during 1970-83 and increased slightly thereafter (perhaps because of the severe droughts of 1985-88). The number of poor in rural Gujarat was lower in 1987-88 than in 1970-71 [Minhas, Jain and Tendulkar 1991].

Our survey data show that the proportion of poor households was significantly lower among households engaged in non-agricultural activities than among agricultural households. The households primarily engaged in scarcity relief work were the only exception to this general pattern [Basant 1994] This finding is consistent with the evidence that the proportion of non-agricultural households increases with per capita household expenditure in rural India and Gujarat [Basant and Kumar 1989; 1990b].

Trends in Wage Rates

The rural wage rates in agriculture, which had remained more or less stable till the mid-1970s, have risen in all the major states thereafter. Between 1970-71 and 1984-85 the largest increase in real wages (52 per cent) came about in Gujarat [Jose 1988]. Bhalla's (1993a) analysis of the changes in the real wage rates at the state level shows:

> ... that over time rising labour productivity really did not make the decisive contribution to the observed rise in real wage rates. Instead, its role was that of an enabling factor... Thus, in the long term rise of real wage rates in India, beginning in the seventies, the prime mover in all states seems to have been workforce diversification, rather than growing labour productivity (p 455).

The growth of the rural non-agricultural sector, therefore, has not put downward pressure on agricultural wages; instead it has contributed significantly to the rise in real agricultural wage rates. This evidence is also inconsistent with the hypothesis of distress diversification. Analysis of our survey data show that, *ceteris paribus*, the probability of an individual's participation in non-agricultural activity increases with the rise in agricultural wage rate in the village [Unni 1994].

Basu and Kashyap (1992) review some case studies conducted in different parts of India. The evidence on the relative wage rates of rural (casual) non-farm workers, though rudimentary, does not suggest distress, in fact these wages were often higher than the peak agricultural wages Unfortunately, time series data on rural non-agricultural wage rates are not available Estimates of daily wage earnings in agriculture and non-agriculture can, however,

Table 11: Non-Agricultural Daily Wage Earnings as a Ratio of Agricultural Daily Wage Earnings, Adult Casual Labour

State	Male Workers			Female Workers

be generated from various NSS employment-unemployment rounds. Such estimates for real wagerates for casual workers are reported in Tables 9 and 10 for three time points, viz, 1977-78, 1983 and 1987-88. State level estimates of consumer price indices for agricultural workers have been used to deflate the money wage earnings. As noted earlier, it is difficult to draw robust conclusions from these estimates because of the influence of transient factors like drought, etc. The estimates for 1987-88 may be vitiated by such conditions in states like Gujarat where drought conditions were severe.

The non-agricultural wage rates for casual workers are higher than those in the agricultural sector. In all states, except Assam, Gujarat and Haryana, the real daily wage earnings have shown an increase during 1977-88 for both male and female workers. For female non-agricultural workers also, the real wage earnings rose consistently; Gujarat was the sole exception. In the case of male non-agricultural workers, the real daily wage earnings increased during 1977-83 and declined thereafter in Assam, Gujarat, Haryana (marginally), Punjab and Rajasthan the remaining states experienced a consistent increase. As a result, the ratio of daily non-agricultural earnings to agricultural earnings declined in these states during this period, while it remained stable or increased in other states (Table 11)

The decline in the real wage earnings of the rural non-agricultural male workers during 1983-88 is somewhat surprising. One explanation can be that in 1987-88 a significant proportion of these workers may have worked on scarcity relief sites, where the wage rates are lower than in other non-agricultural occupations in the area, resulting in a lower 'average' wage earnings for rural non-agricultural activities. It is not possible to test this hypothesis with the available data.

While more work needs to be done in this area, distress does not seem to be the main driving force behind the growth of the rural non-agricultural sector, especially in Gujarat. This is not to suggest that distress conditions do not exist; given the absolute levels of poverty in our country such conditions are bound to be widely prevalent especially in regions where agricultural growth has been tardy. However, such conditions do not seem to have been major contributors to the growth of the rural non-agricultural sector; apparently, poor households have other strategies to cope with their poverty. These strategies may include higher WPRs and multiple activities within agricultural sector.

III
Areas for Further Research

The processes which bring about changes in the employment structure in rural and urban areas need to be explored further. A combination of macro and micro studies in various regions is needed to analyse different dimensions of the problem.

At the analytical level, there is a need to develop well defined hypotheses which can then be tested with purposive data collection and analyses. Longitudinal studies or resurveys may be better suited to analyse the dynamics of this sector than cross-sectional or one time-point surveys. The survey conducted by us showed that distress during a drought year resulted in significant participation in scarcity relief works. Such shifts in employment patterns also got reflected in aggregate NSS statistics, both at the all-India and the regional level [Basant and Kumar 1994]. It will be useful to find out the nature of activities performed by these households/workers in a normal year.

The other focus of future research can be specific activities, occupations or industries which have experienced significant changes in recent years. Our analysis has identified a variety of decaying and dynamic industries and occupations. We can learn a great deal about the processes of change from case studies of such non-agricultural activities. From a policy point of view, the dynamic activities should receive greater attention to identify critical policy initiatives to facilitate further growth of these activities in future.

The rural-urban nexus also requires more careful analysis. Apart from the relationships reflected in aggregate measures, one needs to analyse the quantum and nature of rural non-agricultural activities around towns of different sizes performing different functions.

The potential for rural growth linkages, for all the debate, remains comparatively unexplored. The extent and pattern of surplus generation and use among different types of farm households in various agrarian situations needs to be analysed in greater detail in a broad regional perspective. Only an indepth knowledge of these production and consumption linkages can form the basis for evolving any policy package to induce rural diversification.

If regional linkages (rural-urban/rural-rural) indeed play a crucial role of inducing growth of the rural non-agricultural sector, policies for rural diversification should perhaps be area based rather than individual based. One possible reason why IRDP has not played any significant role in rural diversification is that the beneficiaries were chosen 'in an *ad hoc* manner based on a casual assessment of self-employment possibilities in the neighbourhood' [Rao and Erappa 1987]. The public assets created by wage labour based programmes like NREP also did not create infrastructural assets in a systematic manner to enhance the viability of economic activities in specific regions.

The issue of regional linkages and rural diversification is intricately linked with the dynamics of the small enterprise sector in both rural and urban areas. Significant changes are taking place in the unregistered manufacturing sector in India. A rigorous analysis of these developments is also required. A related issue is that of spatial concentration of enterprises engaged in specific activities which has been observed in various parts of the country. The developments of such 'industrial districts' probably signifies more than simple agglomeration economies, technology transfer and diffusion, co-operation among enterprises through sharing of jobs, labour and machinery also goes on. These complex relationships among enterprises in industrial districts probably improve the viability of these districts as a whole. This has significant policy implications as issues relating to growth of non-agricultural employment are intertwined with aspects of technology transfer, labour relations and 'competitiveness' among enterprises. Resurgence of interest in this area [e g, Kashyap 1992] is welcome and needs to be translated into concrete research programmes. Perhaps, one should explicitly add the dimension of infrastructural growth into these studies. Besides, role of infrastructure by itself in the diversification process needs to be analysed in a systematic manner.

Very few studies explore the impact of government policies, e g, fiscal incentives to locate industries in rural areas. Similarly, other programmes undertaken by the government and voluntary agencies need to be assessed. Changes taking place in the rural non-agricultural sector are not independent of the developments in other sectors. Given the evidence on regional and sectoral linkages, policies to encourage non-agricultural activities in rural areas cannot be analysed in isolation. Policy research in this area has to link sector specific policies with the overall macro-economic policy environment. How to optimise sectoral and regional linkages is the key policy issue.

[This paper is based on the first chapter of the report of a long-term project on the trends and determinants of rural non-agricultural activities in Gujarat undertaken by the Gujarat Institute of Development Research (GIDR), Ahmedabad.

Distribution of Landholdings in Rural India, 1953-54 to 1981-82

Implications for Land Reforms

H R Sharma

How has the concentration of land—both owned and operated—changed over time? At what level of the landownership hierarchy has land concentration tended to become more pronounced as a consequence of the so-called 'agrarian reshuffle'? How have changes in the distribution of landholdings benefited the holdings at the bottom of landownership hierarchy? Which categories of holdings have emerged comparatively better off? To what extent does the concentration of operated land differ from that of owned land?

IN poor agrarian economies, land is the most important asset. Unlike other assets, it maintains its capital value over time and offers more security. Its possession in these societies is a symbol of entitlement, power and privileges and is synonymous with not only the economic status of a household but its social status as well. As a matter of fact, "ownership of land determines to a considerable degree—widening in some case and restricting in others—the range of choices effectively open to different members of agrarian societies" [Raj 1975, p 7]. Again in agrarian regimes, "to own the land is the highest mark of esteem; to perform manual labour, the lowest" [Myrdal 1968, p 1057]. Furthermore, to those who possess land, especially the higher echelons among them, not only the local level institutions such as panchayats, co-operatives and so on are more easily accessible but a better negotiating is available to them to deal with the world outside. Landownership is also considered important for the purpose of effecting permanent improvements on land and is, thus, variously described as an essential prerequisite for technological changes in agriculture. A tenant cultivator may not generally undertake big investment like a landowning cultivator may do.[1]

At the national level, despite varying degrees of industrial development, the dependence of agrarian economies on agriculture has not diminished. For example, in the Indian context, Table 1 informs that in a majority of the states: (i) there has been practically no significant change in the labour force employed in agriculture; nearly 80 per cent or more of the rural workforce continues to depend on agriculture for a livelihood; (ii) more than one-third of the net state domestic product is contributed by agriculture; (iii) land accounts for more than 50 per cent of total assets of rural households. The importance of land both in terms of productivity and employment has increased further with the onset of new agricultural technology.[2] The study of changing land distribution pattern is, therefore, of great socio-economic importance in developing agrarian economies like India.

On the eve of independence, land tenure systems in rural India crystallised into three main varieties, viz, the zamindari, the ryotwari and the mahalwari tenures each accounting for 57 per cent, 38 per cent and 5 per cent of the total privately-owned agricultural land. Despite differences in the nomenclature, agrarian relations under all the three varieties were a variant of semi-feudal production relations characterised by extremely skewed distribution of land, rack-renting, sub-infeudation, usury, forced labour and so on [Malvia 1954; NCA 1976; Nanavati and Anjaria 1970; Sen 1962]. The net result of these archaic production relations was the impoverishment of the rural peasantry on the one hand and stagnation of agricultural production on the other [Blyn 1966]. These agrarian affairs, thus, entailed a complete restructuring of the agrarian relations both in the interest of liberating rural peasantry from the stranglehold of semi-feudal production relations and fostering the agricultural development.

Accordingly, immediately after the dawn of the independence, policy-makers initiated comprehensive agrarian reforms to accomplish the desired objectives. Indeed, these measures, *a la* Thorner constituted the largest body of agrarian legislation to have been passed in so a brief span of time in any country whose history has been recorded [Thorner 1976, p 18]. The most important measure was the abolition of zamindari system. Numerous criticisms of the legislation and its implementation notwithstanding, it has been indisputably hailed as a "thorough agrarian revolution liberating cultivators from a long period of subjugation" [Myrdal op cit, p 1306]. It is claimed that consequent to this measure, 20 million cultivators came into direct contact with the government [NCA op cit, p 50]. Other notable measures were the tenancy legislations followed by land ceiling legislations of Phase I (before 1972) and Phase II (after 1972). The effectiveness of these legislations in meeting their objectives has been elaborately examined both by individual scholars [Joshi 1995; Appu 1975; Bandyopadhyay 1986; Sharma 1992] as well as official agencies such as the Planning Commission.

In addition to the institutional reforms, Indian agriculture also experienced far-reaching technological changes in certain parts of the country since mid-1960s having profound implications for the whole gamut of agrarian relations in general and the distribution of landholdings in particular. For example, with agriculture becoming more and more remunerative, an increasing tendency for self-cultivation, subdivision of holdings participation of large farmers in lease market and growing concentration of operated land and so on are reported from many parts of the country [Bhalla 1977; Griffin 1979; Ghosh 1981; Vyas 1970; Rao 1972; Nadkarni 1976; Jodha 1984; Singh and Kahlon 1976; Singh 1989].[3] Unrelenting demographic pressure is yet another notable factor having direct bearing on land distribution such as growing marginalisation of holdings and/or growing landlessness and so on.

There has been no dearth of studies on the changing distribution of landholdings in rural India [Sanyal 1977, 1988; Singh 1976; Sirohi et al 1976; Vyas 1979; Dutt 1977; Rao 1972; George et al 1976, Raj 1971, 1976; Haque 1987; Nair 1990]. A critical review of these studies, however, reveals that they are at best disjointed bits. Not only that, some of these have drawn conclusions from non-comparable data [Sanyal 1979] besides being limited in coverage both in terms of time and space. To say the least, these studies do not weave a consistent temporal story of the changes in the distribution of landholdings since 1950s occasioned by the combined effect of institutional, technological and demographic factors. In more concrete terms, they provide no clear-cut answers to the following questions: How has the concentration of land—both owned and

operated—changed over time? At what level of the landownership hierarchy has land concentration tended to become more pronounced as a consequence of the so-called 'agrarian reshuffle'? How have changes in the distribution of landholdings benefited the holdings at the bottom of landownership hierarchy? Which categories of holdings have emerged comparatively better off? To what extent does the concentration of operated land differ from that of owned land? This article examines these issues

The article is organised in five sections. While Section I is devoted to analysing the nature of available data and their suitability in deciphering the temporal changes in the distribution of landholding, Sections II and III respectively analyse the changes in the distribution of ownership and household operational holdings Section IV sums up the major findings emanating from the study Implications for land reforms are indicated in Section V.

I
The Data

To look into the changes in the distribution of landholdings, the National Sample Survey Reports and the Agricultural Census Reports on Landholdings are the two major sources of data. However, the agricultural census emerged only after 1970-71 and not to speak of the latest being 1985-86—the 1980-81 reports for some states are still not available Also, as is well known, the agricultural census data are largely a carry forward of questionable and less reliable land revenue records at the grass roots level for most of the states. Again, not only the types of personnel involved in their tabulation but also the methodology adopted to arrive at the number of holdings leave much to be desired [Sanyal and Sinha 1977] [4] In comparison to this, the NSS data are the only source of information which extend from as early as 1953-54 (8th round) to as late as 1982 (37th round). In other words, the NSS data alone allow us to build the temporal profile of land distribution pattern since the early 1950s. In brief, the data thrown up by the National Sample Survey, although not completely free from conceptual deficiencies and definitional deviations, are based on more scientific methodology and are still the most satisfying lot of information. It may, however, be underlined that because of the reorganisation of the states in 1956, the inter-temporal comparability of the 8th round data with those of the later rounds was seriously jeopardised; as many as seven states, namely, Andhra Pradesh, Gujarat, Karnataka, Kerala, Madhya Pradesh, Maharashtra and Tamil Nadu were affected. Data adjustment is, however, made, even though in a less than perfect form, on the basis of geographical area transferred from the unorganised states to the organised states.[5]

II
Ownerhip Holdings

In spite of some obvious limitations of gini coefficient as a tool to measure the extent of concentration, it is used most commonly to gain a bird's-eye view of the prevailing inequalities. Therefore, to begin with, we use gini coefficient for this purpose.[6] The changing values of gini coefficients both including and excluding landless households for ownership holdings are given in Table 2 The table throws up the following features.

The concentration of holdings, in terms of gini coefficient including landless households, declined markedly across the states during 1953-54 and 1961-62 However, if one were to go by the gini coefficients without landless households, the concentration of holdings declined only in 6 states, namely, Assam, Jammu and Kashmir, Karnataka, Kerala, Tamil Nadu and West Bengal; in all the remaining states, it increased by varying degrees As regards 1960s, the decline in the concentration of holdings in terms of gini coefficient including landless households was much less pronounced, in as many as seven states, namely, Assam, Gujarat, Karnataka, Punjab and Haryana, Tamil Nadu, Uttar Pradesh and West Bengal, the levels of inequalities remained practically unchanged. On the other hand, in terms of gini coefficients without landless households, the distribution of holdings became less iniquitous in a majority of the states. The decade of 1970s, however, marked a bold departure from the earlier trends inasmuch as the concentration of holdings by all reckonings either increased by varying degrees or stayed practically unchanged in a majority of the states. The only notable exceptions were Assam, Kerala, and Orissa where in terms of gini coefficients including landless households, it declined fairly noticeably.

In over all terms, the general impression which emanates from Table 2 is that the concentration of holdings including landless households declined across the states between 1953-54 and 1982, notwithstanding some increase in the values of gini coefficients for a majority of the states during 1970s. However, if one were to filter one's impression and judgment from the changing values of gini coefficients excluding landless households, the extent of inequalities in most of the states remained, by and large, unchanged.

It may, however, be mentioned that changes in the gini coefficients do not tell the complete story; as noted above, it gives only a surface view Our judgment, therefore, should not depend upon the changes in the values of gini coefficients alone A detailed

Table 1: Importance of Land in Indian Economy. Some Selected Indicators

States	Percentage Share of Agriculture in NSDP			Percentage of Rural Workforce Depending on Agriculture			Percentage Share of Land in Total Assets of Rural Households

analysis of changes in the concentration of holding is essential. For this purpose, it is advisable to ascertain as to what level of distribution the concentration of land has tended to grow or thin out. It needs to be underlined that an increase in the concentration of holding at different levels of distribution is the manifestation of the operation of different sets of forces. For example, while the swelling of bottom ranks signifies the growing marginalisation of holdings, evidence on the burgeoning incidence of landlessness would be a clear indication of the ongoing process of proletarianisation. Each of the above changes has different policy implications. For instance, if the concentration is growing at the levels of marginal/small holdings, measures to make these holdings economically viable by ensuring cheap and subsidised inputs may be called for. On the other hand, if it is becoming more pronounced at the level of medium holdings, policy measures such as lowering of ceilings, rationalisation of the policy of subsidising inputs and so on might need urgent attention.

Therefore, to be more precise as to what level of landownership hierarchy the concentration of land has tended to grow over time, we computed the share of 1 per cent, 5 per cent, 10 per cent and 20 per cent of the households at the top of landownership hierarchy, 40 per cent and 30 per cent at the middle level and 50 per cent at the bottom.[7] The results are given in Table 3. The table calls for the following observations.

Between 1953-54 and 1961-62, the decline in the top concentration of area owned at different levels across the states was accompanied by an increase in the concentration at the middle 30 per cent and 40 per cent levels. The share of area owned by the 50 per cent of the households at the bottom of landownership hierarchy remained practically unchanged in a majority of the states except Jammu and Kashmir, Karnataka, Madhya Pradesh, Rajasthan and Uttar Pradesh where some increase was in evidence. As regards the periods, 1961-62 and 1971-72, three broad patterns emerged. Firstly, in Andhra Pradesh, Bihar, Kerala and Madhya Pradesh decline in the top concentration at different levels was associated with practically no change in the bottom concentration but appreciable increase in the middle level concentration, secondly, three states, namely, Jammu and Kashmir, Orissa and Rajasthan recorded decline in the top concentration at various levels along with concomitant increase in the bottom and middle level concentration; thirdly, while in some states most notably, Gujarat, Punjab and Haryana and West Bengal top concentration at all levels increased by differing proportions along with some decline in the bottom and middle level concentration in four others, namely, Assam, Karnataka, Tamil Nadu and Uttar Pradesh the level of concentration at various levels remained, by and large, unchanged. Coming to 1970s, in four states, i e, Bihar, Kerala, Rajasthan and Tamil Nadu no clear-cut pattern was in evidence, whereas in three others such as Andhra Pradesh, Gujarat and Uttar Pradesh, the land concentration at various levels remained nearly unchanged. Among the remaining states, Assam, Orissa and Punjab and Haryana recorded decline in the top concentration at different levels along with attendant increase in the middle and bottom level concentration while opposite trends were discernible in Jammu and Kashmir, Karnataka, Madhya Pradesh, Maharashtra, Rajasthan and West Bengal.

In brief, taking a long period view, it comes out clearly that decline in the top concentration at different levels across the board was accompanied by a fairly appreciable increase among the middle 30 per cent and 40 per cent households in the landownership hierarchy. Insofar as the proportion of area owned by the bottom 50 per cent of the households was concerned, it remained practically unchanged in a majority of the states except Assam, Jammu and Kashmir, Kerala, Orissa and Rajasthan.

Having analysed the trends in the concentration of ownership holdings from different angles, we take up the changes in the proportion of different categories of holdings and area owned by them. Such an exercise is essential to ascertain: (i) what proportion of holding is constituted by sub-marginal holdings (0.01-0.99 acre) and their proliferation over time; (ii) what proportion of holdings and area owned is accounted for by large holdings; and (iii) which categories of holdings have emerged stronger over time.

To avoid unwieldy descriptions and to facilitate inter-temporal and spatial comparisons, the different farm size groups given in NSS reports are condensed into five categories: (i) Sub-marginal holdings (0.01-0.99 acre); (ii) marginal holdings (1-2.49 acres); (iii) small holdings (2.50-4.99 acres); (iv) large holdings (15 acres and above).[8] The changing proportion of different categories of holdings along with area owned by them is set out in Table 4. The salient features emanating from the table are summarised below.

(i) The proportion of households owning no land declined across the states both during 1950s and 1960s; the magnitude of decline was, however, much less pronounced during the later period in comparison to the former. The decade of 1970s was marked by a significant departure from the earlier trends inasmuch as the incidence of landlessness increased by varing degrees in a majority of the states. It may, however, be noted that a major part of the decline in the porportion of landless households between the 8th round (1953-54) and the 17th round (1961-62) could be explained in terms of changes in the concept of ownership holding between the two NSS rounds; ownership holding in the 8th round included pure ownership holdings while subsequent rounds in addition to pure ownership holdings also included ownership-like possession [Cain 1983; Chadha-Sharma 1991; Sawant 1990; Sharma 1992]. Nevertheless, some decline in the incidence of landlessness during 1960s might

be explained in terms of the acquisition of some land by the landless households as documented by a number of empirical studies [Attwood 1979; Bhalla 1977, Dantwala and Shah 1971, Rao 1972; and Walker and Ryan 1990]

(ii) Among different landowning categories, all the states recorded varying degrees of decline in the numerical strength of large holdings and area owned by them; the decline was, however, more pronounced during 1960s in comparison to 1950s and 1970s. This could perhaps be ascribed to the enactment and implementation of ceiling laws during 1960s in comparison to 1950s when most of the states did not have such laws. Apprehending the confiscation of land, many of the landowners during 1960s disposed of their land to their tenants and resorted to benami transfers unlike in the 1950s when an unprecedented eviction of tenants is alleged to have taken place [Khusro 1958; Dandekar 1962] in the guise of self-cultivation on 'sir' and 'khudkast' land.[9] During 1970s, on the other hand, the landlords might have preferred to retain their land in view of the ineffective implementation of the ceiling laws of phase I (before 1972).

(iii) Insofar as the holdings at the bottom of landownership hierarchy, say, sub-marginal (0.01-0.99 acre) were concerned, their numerical strength expanded by a fairly big proportion especially during 1950s. In comparison to the proliferation in their numbers, the proportion of area owned by them did not increase beyond insignificant margins in any of the states except Kerala, Assam and West Bengal

(iv) The changes in the distribution of different categories of holdings and area owned by them over periods 1953-54 and 1982, thus, largely benefited medium, small and marginal holdings. A state by state analysis reveals that marginal (1-2.49 acres) and small (2.50-4.90 acres) holdings gained substantially in the states of Bihar, Assam, Jammu and Kashmir, Kerala, Orissa, Tamil Nadu, Uttar Pradesh and West Bengal. A closer perusal, however, reveals that even among these states, aside from Assam, Kerala and Jammu and Kashmir, medium holdings (5-14.99 acres) have emerged comparatively better off. It comes out from the fact that decline in the proportion of such holdings in all these states was much higher compared to that of area. In the remaining states, namely, Andhra Pradesh, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Punjab and Haryana and Rajasthan, medium holdings consolidated their position continuously, some gains accruing to small and marginal holdings notwithstanding. In brief, over the period 1953-54 to 1982, medium holdings emerged much stronger in comparison to the other categories of holdings.

Despite the above noted changes, glaring inequalities in the land distribution continue

to loom large. In all the states, a very small proportion of holdings at the top owned a disproportionately large amount of area. For instance, towards the early 1980s, 4.29 per cent of holdings in Andhra Pradesh, 1.35 per cent in Bihar and 6.33 per cent in Punjab and Haryana respectively owned as high as 37.25 per cent, 15.34 per cent and 40.29 per cent of the total land; at the all-India level, 3.98 per cent of the holdings owned as high as 33.26 per cent of the area. Viewed from a different angle, the extremely high inequalities in the distribution of land are evident from the fact that the area owned by the top 1 per cent of the holdings across the states varied between 7.91 per cent in Jammu and Kashmir and 16.78 per cent in Andhra Pradesh; at the national level it was 14.35 per cent.

It, however, needs to be underlined that the distribution of ownership holdings only tells the *de jure* position. In poor agrarian economies, where the institution of tenancy is more pronounced, the *de facto* position is better indicated by the distribution of household operational holdings. Accordingly, changes in the distribution of household operational holdings indicate not only the access to resources of different categories of households but also *ceteris paribus*, their share in the gains from agricultural development. It is, therefore, extremely important to examine the temporal changes in the distribution of operational holdings.

III
Household Operational Holdings

Table 5 provides an overview of the changes in the concentration of household operational holdings measured in terms of gini coefficients both including and excluding households operating no land. The following observations may be in order.

The concentration of holdings declined by varying degrees practically in all the states between 1953-54 and 1961-62; it was evident from the decline in the values of gini coefficients both including and excluding households not operating land. The decline in the concentration of holdings continued further during 1961-62 to 1971-72. This state of agrarian affairs could partly be explained in terms of the enactment and implementation of ceiling and tenancy laws. The period 1971 72 to 1982 was marked by a noticeable departure from the earlier trends inasmuch as the values of gini coefficients both including and excluding households not operating land increased by varying degrees in a majority of the states. Some of the plausible factors responsible for the increase in the concentration of holdings during 1970s could be, *inter alia*, the resumption of leased-out land for self-cultivation in the wake of the spread of new agricultural technology readily facilitated through the institutional and price support to the agricultural sector, participation of large farmers in the lease markets, and so on.

However, as noted earlier, since changes in the gini ratios do not tell as at what level the concentration has tended to grow or decline, we computed the changes in the percentage of area operated by various groups of households such as 1 per cent, 5 per cent, 10 per cent and 20 per cent at the top, 30 per cent and 40 per cent at the middle, 50 per cent and 40 per cent at the bottom. The results are given in Table 6. The table offers the following insights.

During the period 1953-54 to 1961-62, as many as nine states, namely, Assam, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Punjab and Haryana, Tamil Nadu, Uttar Pradesh and West Bengal recorded declines of varying degrees in the top concentration at different levels along with a concomitant increase in the middle and the bottom level concentration. Among the remaining states, while the level of concentration at different levels remained practically unchanged in Bihar, Kerala and Orissa, some increase in the top concentration was in evidence in Jammu and Kashmir. During 1961-62 to 1971-72: First, in seven states, namely, Andhra Pradesh, Bihar, Jammu and Kashmir, Kerala, Madhya Pradesh, Maharashtra and Orissa the decline in the top concentration at different levels was accompanied by an increase of varying degrees in the middle level concentration. Second, while in Uttar Pradesh top concentration at various levels increased along with decline of varying proportions in the bottom and middle level concentration, no neat pattern was discernible in Karnataka, Rajasthan, Tamil Nadu and West Bengal The decade of 1970s was, however, marked by an increase in the concentration at top different levels along with attendant decline in the middle and bottom level concentration in a majority of the states.

On the whole, during 1953-54 to 1981-82, concentration of household operational holdings, measured by the gini coefficients including households not operating land, did not differ strikingly in a majority of the states; the values of gini coefficients remained either practically unchanged or even increased *albeit* marginally. However, going by the gini coefficients excluding households not operating land, the concentration of holdings in 1982 was noticeably lower compared to 1953-54.

In terms of the changes in the proportion of area operated by households at different levels, it comes out clearly that while middle level concentration increased in six states, namely, Andhra Pradesh, Assam, Madhya Pradesh, Orissa, Rajasthan and West Bengal, increase in the top concentration at various levels was discernible in six others, i e, Gujarat, Jammu and Kashmir, Maharashtra, Punjab and Haryana, Uttar Pradesh and Tamil Nadu. More significantly, the proportion of area operated by the bottom 40 per cent households remained practically unchanged in most of the states except Kerala.

Insofar as changes in the proportion of different categories of households and area operated by them are concerned, Table 7 throws up the following features.

(i) The proportion of households operating no land[10] increased in all the states between 1953-54 and 1961-62 A large part of this increase can be explained in terms of definitional changes in the concept of household operational holding between the 8th round and the 17th round It may be recalled that the concept of operational holding in the former round included area put to both agricultural and non-agricultural uses while in the latter round it only included area put to agriculture wholly or partly. Accordingly, in the 8th round many of the sub-marginal households possessing only non-agricultural land were put in the category of 0.01-0.99 acre whereas during the 17th round such households were designated as those not operating any land. During the period 1961-62 to 1971-72, while the proportion of households not operating land declined in Assam, Kerala, Orissa, Rajasthan and West Bengal in the remaining states their numerical strength increased by varying degrees. The proportion of such households between 1971-72 and 1982 increased in seven states such as Andhra Pradesh, Maharashtra, Orissa and Rajasthan and declined in the remaining states.

(ii) The numerical strength of large households declined continuously both in terms of their number and acreage operated. However, over the period, in the vein of ownership holdings, decline was more pronounced during 1960s in comparison to 1950s and 1970s; during the latter period not only the decline in the proportion of area operated by large holding was tempered but in four states, namely, Assam, Jammu and Kashmir, Orissa and Uttar Pradesh, it remained pratically unchanged.

(iii) Regarding the holdings at the bottom of farm size ladder, our analysis reveals that their numerical preponderance increased continuously in most of the states particularly since 1961-62. The increase in the proportion of area operated by them was, however, markedly lower except in Jammu and Kashmir, Kerala and West Bengal. Consequently, the land-man ratio among tiny holdings showed a continuous decline in most parts of rural India and in net economic terms, the vast majority of the farm operators were obliged to seek their living from an extremely thin land base; in brief, most parts of rural India appeared to

TABLE 4: TRENDS IN THE DISTRIBUTION OF OWNERSHIP HOLDINGS IN RURAL INDIA: MAJOR STATES, 1953-54 TO 1982

have witnessed the sharpening of the polarisation process.

(iv) In net terms, over the period 1953-54 to 1982 the changes in the distribution of household operational holdings went largely in favour of small, marginal and medium holdings. Going through state by state changes, it comes out clearly that over the period 1953-54 and 1982 substantial gains accrued to marginal and small households in most of the states. This, however, cannot eclipse a much bolder reality that medium households (5 to 14.99 acres) emerged comparatively better off in the sense that decline in the proportion of such households was considerably higher in most of the states compared to that in area. The notable exceptions were Jammu and Kashmir, Kerala and West Bengal. Despite changes in the distribution of household operational holdings as outlined above, as witnessed in respect of ownership holdings, very few households at the top accounted for a disproportionately large amount of area operated. For example, in the early 1980s, 1.25 per cent of large households in Bihar and 1.70 per cent in Uttar Pradesh operated as high as 14.03 per cent and 15.12 per cent of the total area respectively. A more or less similar picture was obtained in other states as well The magnitude of inequalities in terms of the amount of area operated by the top 1 per cent of households varied from as high as 17 20 per cent in Andhra Pradesh to as low as 7.86 per cent in Jammu and Kashmir; at the national level it was 14.44 per cent.

IV
Summing Up

The major findings emanating from our analysis are summarised below.

(i) The concentration of ownership holdings across the states, measured in terms of gini coefficients including landless households, was markedly lower towards the early 1980s in comparison to the early 1950s, varying degrees of increase in the values of gini coefficients for a majority of states during 1970s notwithstanding. However, if one were to filter one's impression through the changes in the values of gini coefficients excluding landless households, the extent of concentration remained practically unchanged. Likewise, the concentration of household operational holding measured in terms of gini coefficients including households not operating land, stayed by and large, unchanged in a majority of the states; the concentration was however, significantly lower if households not operating land were not included.

(ii) Regarding changes in the concentration of owned land at different levels of landownership hierarchy over the period 1953-54 and 1982, our analysis reveals that a fairly noticeable decline in the top concentration at different levels such as 1 per cent, 5 per cent, 10 per cent and 20 per cent across the states was accompanied by a pronounced increase among the middle 40 per cent to 80 per cent and 50 per cent to 80 per cent households. More importantly, the percentage of area owned by the bottom 40 per cent of the households remained practically unchanged in a majority of the states except Assam, Jammu and Kashmir, Kerala, Orissa, and Rajasthan. On the other hand, changes in the concentration of operated land at different levels reveal: (a) middle level concentration increased by varying degrees in six states, namely, Andhra Pradesh, Assam, Madhya Pradesh, Orissa, Rajasthan and West Bengal; (b) six other states, i e, Bihar, Jammu and Kashmir, Punjab and Haryana, Maharashtra, Tamil Nadu and Uttar Pradesh, concentration of operated land at top different levels became more pronounced; (c) in the vein of ownership holding, the proportion of area operated by the bottom 40 per cent households remained practically unchanged in most of the states except Kerala

(iii) Categorywise changes in the distribution of ownership holdings reveal that despite a fairly noticeable increase in the proportion of landless households during 1970s in most of the states, their numerical strength during the early 1980s was considerably lower compared to the early 1950s. Among the landowning categories, the predominance of large holdings (15 acres and above) declined significantly both in terms of their numbers and acreage owned. The holdings at the bottom, say, sub-marginal holdings (0.01-0.99 acre), witnessed a fairly significant increase; however, in comparison to an increase in their numbers, the accretion to their area owned was markedly lower. In net terms, practically in all the states, aside Assam, Jammu and Kashmir and Kerala, medium holdings (5-14.99 acres) emerged comparatively better off, despite substantial gains which accrued to marginal (1-2.49 acres) and small holdings (2.50-4.99 acres) in some states, most notably, Bihar, Orissa, Tamil Nadu, Uttar Pradesh and West Bengal. A more or less similar pattern was discernible in respect of changes in the proportion of different categories of household operational holdings and area operated by them. For example, while the importance of large holdings declined both in terms of their number and acreage operated the holdings at the bottom, i e, sub-marginal holdings, witnessed a remarkable proliferation especially since 1961-62; the proportion of area operated by these holdings, however, recorded negligible increase in all the states except Assam, Kerala and West Bengal. However, as witnessed in case of ownership holdings, almost in all the states except Jammu and Kashmir and Kerala, medium households consolidated their position continuously. Fairly noticeable gains also accrued to small and marginal holdings in some states particularly, Assam, Bihar, Orissa, Tamil Nadu, Uttar Pradesh and West Bengal. In sum, the evidence thrown up by NSS data clearly shows that the lion's share of the area owned/operated shed by the holdings at the top has largely come to stay with medium holdings.

(iv) The above noted changes in the distribution of ownership/operational holdings notwithstanding, glaring inequalities continue to loom large. For example, towards the early 1980s, the amount of area owned by the top 1 per cent holdings varied from 16.78 per cent in Andhra Pradesh to 7.91 per cent in Jammu and Kashmir, while the area operated ranged from 17.20 per cent to 7 86 per cent, at the national level the area owned and operated by these holdings was 14.35 per cent and 14.44 per cent respectively.

V
Implications for Land Reforms

The preceding analysis shows: (i) despite varying degrees of decline in the proportion of area owned/operated by the households at the top of the landownership hierarchy, glaring inequalities continue to persist, (ii) practically in all the states land concentration has become more pronounced at the middle level, (iii) a preponderant majority of rural households at the bottom of landownership hierarchy has remained, by and large, unaffected in the process of land distribution. It is against this background that land reform measures continue to remain an important policy intervention area.

Insofar as the implementation of land ceiling laws is concerned, Table 8 throws up the amount of land that would become surplus under the existing and proposed ceilings and the range of average size of holdings in different states consequent to the distribution of surplus land among the landless and near-landless households. Assuming that the proposed ceilings are politically and administratively pushed through and surplus land distributed among the target households, columns 12, 13, 14 and 15 of the table reveal that such an exercise shall lead to extremely small holdings. The implementation of radical land ceiling laws, therefore, needs to be accompanied by action on many institutional fronts such as promoting some kind of co-operation among extremely small and non-viable holdings, the provision of complementary inputs like seed, fertilisers, cheap and adequate credit, promotion of agriculture related enterprises like dairy, pisciculture, etc, and so on to make such holdings economically viable and enable them to cross the poverty line. Unless action is mounted on all these fronts, the indiscriminate implementation of ceiling laws may not yield the desired results, not only that, the implementation of such radical land distribution policy may also not make any worthwhile dent on rural poverty [Minhas 1971, pp 112-13; Dandekar and Rath 1971, pp 94-95] On the contrary, in the process, agricultural production may be affected adversely.

Perhaps, an alternative to radical land ceiling laws, keeping regard for (i) the

prevailing socio-politico-economic settings where it is neither politically expedient nor administratively easy to push through lower land ceilings and (ii) the successful Kerala and West Bengal models of tenancy reforms, lies in the rigorous implementation of tenancy legislations to make a dent on the glaring inequalities in the distribution of land as well as rural poverty. The leased-in area is estimated to be around 89,35,000 hectares of which 62,55,000 hectares (70 per cent) is accounted for by small and marginal households including landless. Allowing for the amount of area leased-out by small and marginal households, the net area leased-in by the small and marginal farmers including landless households is 42,53,000 hectares [Parthasarathy 1991, p A-32] which is more than the amount of land declared surplus so far (column 6, Table 8). The tenancy laws, therefore, should be rigorously and judiciously enforced and ownership rights conferred on tenants.

Even the less radical action, i e, the registration of tenants coupled with restricting the landowners' right to resume land for self-cultivation on the pattern of 'Operation Barga' will go a long way in mitigating tenurial harassments and boosting the agricultural production.[11] While not going into details of 'Operation Barga' especially the grass roots mobilisation of beneficiaries,[12] it is essential to emphasise that even with a small degree of political commitment and administrative willingness, numerous loopholes in the tenancy legislation can be plugged with great benefits for the weaker sections. Parthasarathy has convincingly demonstrated that net economic gains of marginal and small tenants could rise by substantial margins even by enforcing the laws regarding the maximum rent to be charged from the tenants [Parthasarathy op cit, p A-36]. It also needs to be underlined that the implementation of tenancy laws does not pose political difficulties as severe as in the case of ceilings on landholdings. More importantly, not only will the rigorous implementation of tenancy laws lead to an increase in agricultural production without adversely affecting genuinely large productive holdings, it will also moderate the glaring inequalities in the distribution of land to a great extent.

Another measure of extreme importance in view of the growing sub-division and fragmentation of holdings is consolidation. Although the extreme importance of this measure has been reiterated almost religiously plan after plan, yet in terms of actual achievements, the programme is a great disappointment except in the green revolution states of Punjab, Haryana and western Uttar Pradesh and to some extent in Orissa. It is indeed a pity that consolidation of holdings has yet not covered more than one-third of India's cultivable area. The blessings of consolidation in hastening the spread of new agricultural technology in Punjab has been very well documented [Chadha 1986].

One of the most serious handicaps in carrying out consolidation of holdings is the absence of updated land records at the grass roots level. Most notoriously, large parts of eastern India have no land records. In this context, a number of useful suggestions were listed in the agenda notes for the June 1990 chief ministers' conference which need to be implemented seriously. Happily, the importance of

Notes: (i) While estimating the surplus land under different levels of ceilings, allowances could not be made for area under irrigation and for various exemptions allowed under the existing ceiling laws. So the estimates are indicative only. For calculating the average size of holdings, the area currently owned by near landless households is also taken into account.

(ii) Surplus land available under the existing ceilings is estimated by taking the average of lower and upper limit prescribed for unirrigated land. However, in the case of Karnataka, Madhya Pradesh, Maharashtra, Punjab, Rajasthan and Tamil Nadu, 20.25 hects is taken as the ceiling level inasmuch as it is the highest farm size up to which data are tabulated in NSS report on ownership holdings.

(iii) In respect of Madhya Pradesh and Maharashtra, restricting the average size of holding up to 0.50 hect under situation III and IV some surplus land is left. Likewise, in Rajasthan if the minimum size is restricted to 1.00 hect, surplus land is left under all situations.

(ii) Figures in column 11 are taken from Report on Ownership Holdings, No 330. Near landless are those having land <.20 hectare.

updated land records has been recognised at the highest level of policy-makers.

In the ultimate analysis, however, an enduring solution to lessen the dependence of rural population on land lies, going by the historical experience, in the expansion of non-agricultural activities and gradual shift of rural workforce from agriculture. Inasmuch as the fundamental change in rural societies emanates primarily from the development of their agriculture, agrarian reforms have a fundamental role to play.

Notes

[The author is grateful to G K Chadha for comments on earlier draft of the paper. The usual disclaimers apply.]

1 Recent theorists of semi feudalism have sought to explain the technological backwardness of the poor agrarian economies in terms of the widespread prevalence of the institution of tenancy, in particular share tenancy in conjunction with the exploitation of tenants in the inter related credit and labour markets. See Bhaduri 1973, Prasad 1973, 1974, Chandra 1974.

2 While the overall impact of new agricultural technology on employment remains a moot point the use of HYV and fertiliser is reported to be employment augmenting. For a summary of the findings emanating from empirical studies regarding the impact of different components of new agricultural technology on employment see Basant 1987.

3 Scholars writing in the early phase of green revolution predicted the growing polarisation of rural society into a stratum of capitalist producers and rural proletariats. See Byres 1972, Dasgupta 1975, Parthasarathy 1991.

4 The differences in the methodological details and the procedure adopted in the collection of data by the National Sample Survey and Agricultural Census have been examined by the working group set up by the government of India to reconcile the data on landholdings thrown up by these two sources for the years 1981 82 and 1980 81. See Report of the Working Group, Ministry of Agriculture, 1989.

5 For the adjustments needed to ensure temporal comparability of data thrown up by different NSS rounds see Chadha Sharma 1992, Sanyal 1976; Sawant 1990.

6 To eliminate the bias arising because of changes in the number of size classes, the gini coefficients for all the four NSS rounds were calculated taking 12 uniform farm size groups in respect of ownership holdings and 11 in the case of operational holdings. The following formula was used for calculating the gini coefficient

$$Gc = \frac{\Sigma\, [|X_i Y_{i+1} - (X_{i+1} Y_i)|]}{100 \times 100}$$

7 For computing the respective shares the following lagrangian form of interpolating polynomial was used

$$\bar{y}(\bar{x}) = \sum_{i=\min}^{\min+d} L_i(\bar{x})\, y_i$$

$$\text{where } L_i(\bar{x}) = \sum_{j=\min}^{\min+d} \frac{(\bar{x} - x_j)}{(x_i - x_j)}$$

$i = \min, \min+1, \ldots, \min+d$

For details see Carnham et al, 1969, Nair et al, 1990.

8 We are fully aware of the limitations of combining different categories of holdings and comparing a particular category of households from one state with its counterpart in other.

9 Numerous studies have documented the phenomenal increase in the land sales by the big landlords in the wake of the enactment and implementation of ceiling laws. See Galgalikar et al 1976, Shergil 1986.

10 Households not operating any land comprised households owning but not operating land and those who neither own nor operate land. For classification see Sharma 1992.

11 Despite the fact that the effect of the institution of tenancy on production is a point of debate since the days of Adam Smith, it is generally considered to affect agricultural production adversely.

12 The implementation of tenancy reforms in West Bengal is discussed by Dasgupta (1987), while the Kerala experience is documented by Raj and Tharakan (1983).

Tenancy in the Context of Irrigation Uncertainty

Role of the Leading Input in Shaping Institutions

D Narayana
K N Nair

The authors' analysis of data collected from village surveys in Kanyakumari district in Tamil Nadu shows that both the incidence and form of tenancy are governed by the irrigation situation and the changes in it. Irrigation uncertainty leads to a lower incidence of tenancy and the form itself changes in the direction of sharecropping. In understanding the terms of contract in the land market, a unified treatment of the land and labour markets is helpful. But its application is limited to the case when the crop cultivated is a subsistence crop. Such unified treatment is not essential for the understanding of land contracts when the crop cultivated is a cash crop.

I
Introduction

THE past three decades have witnessed the growth of a voluminous literature on tenancy and related institutions. Problems of resource use efficiency, role of markets, inter-linkages between markets and the emergence of institutions have all emerged as major issues.[1] However, an aspect that has not received adequate attention in the past relates to the role of irrigation in relation to tenancy. Part of the reason could be the fact that in east Asian and western Europe contexts (to which is related a lot of work on tenancy) there is no moisture constraint and therefore irrigation does not have the status of a leading input. However, in south Asia the incidence and form of tenancy are influenced by rainfall and irrigation. Though past studies have recognised the relevance of it, mostly it has been taken as one of the explanatory variables in regressions.[2] These studies though interesting are far from adequate in bringing out the process through which irrigation shapes the working of land lease market.

Another issue that has vexed researchers is the evolution of institutions. A recent summary by Bardhan brings out the state of confusion:

> The Marxist, CDAWN,[3] and imperfect information theories are all equally murky on the mechanism through which new institutions and property rights emerge. All three sets of theory, in explaining historical transition, show how new institutions will serve the interests of economic progress and old institutions are a hindrance and are 'ripe' for a change—but as if ripeness is all: as if there is no need to specify a predictable model of the *process* of change [Bardhan 1989: 6].

Especially important in the context of south Asia is the evolution of tenancy in a situation of irrigation uncertainty.

In a recent development a strong reaction has come about to the treatment of tenancy independently of the labour market. Hayami and Otsuka put it thus: "separate analysis of land and labour contracts have resulted in much theoretical confusion as well as questionable interpretations of empirical data especially those drawing inferences about the relative efficiency of alternative contracts" [Hayami and Otsuka 1993: 2] and argue for a unified treatment. In their enthusiasm they fail to set out the limits of unified treatment. Unified treatment cannot be a general requirement; it may be relevant under specific conditions.

This paper seeks to address these three issues in an interconnected way. The paper begins by setting out the facets of irrigation uncertainty in a surface irrigation system of long standing and then establishes a relationship between the changing irrigation situation and the incidence and form of tenancy. The usefulness of a unified treatment in understanding the various dimensions of tenancy in a basically subsistence paddy cultivation is then brought out. It is shown that such a unified treatment is not essential for understanding tenancy in cash crop (banana) cultivation.

The data for this study was collected from village surveys conducted in Kanyakumari district in Tamil Nadu. An important feature of this district is the significant variations in the agro-ecological conditions. The district has high rainfall zones similar to Kerala. There is also a large part of the district resembling the conditions in the semi-arid regions in India. The district has a long history of irrigation.[4] Before this century there existed in the district an interlinked system of tanks and diversion weirs for irrigation. From the early part of this century, there has been growth of canal irrigation. During the recent past the district has been witnessing acute scarcity of irrigation water and it has been felt more in the lower reaches than in the upper reaches. In order to understand how the changes in the availability of irrigation has influenced the land lease market we undertook case studies of four villages: two from the upper reaches (UR) Kothanalloor (Kn) and Kadukkara (Kd) and two from the lower reaches (LR) Pattarivilai (Pv) and Azhagappapuram (Az). To collect the data, a listing of all the households was carried out, followed by the identification of the tenant households. From them were collected data on not only

Table 1: Rainfall in Kanyakumari District

Years	Seven-Year Annual Average (mms)	Deviation from the Normal
1902-1908	1160.7	-14.99
1909-1915	1121.3	-17.88
1916-1922	1518.1	+11.18
1923-1929	1650.7	+20.89
1930-1936	1520.3	+11.35
1937-1943	1399.5	+2.50
1944-1959	1405.3	+2.92
1951-1957	1300.8	-4.73
1958-1964	1434.1	+5.03
1965-1971	1438.8	+5.38
1972-1978	1341.8	-1.73
1979-1985	1173.9	-14.03
1986-1989	1109.2	-18.76
Overall	1365.4	—

Note: Deviation from the normal is defined as (Seven Year Average – Overall Average) 100 / Overall Average.

the current tenancy, but also on the tenancy history.[5]

The paper is organised into six sections. Section II provides a brief analysis of the quantum of rainfall and goes to show that irrigation has suffered since the early 1970s. Section III using the data from two UR villages and two LR villages attempt to relate the shift from fixed rent to sharecropping to the irrigation uncertainty in the LR villages. The usefulness of a unified treatment of land and labour markets is brought out in the section. The various dimensions of fixed rent in paddy cultivation—variation in rent across the villages, across plots within a village, across different size class of leased in land, etc—are gone into in Section IV. Section V turns to the terms of tenancy in one of the UR villages where banana cultivation is widespread While Section III brings out the relevance of a unified treatment, Section V clearly points to its limitations. Section VI is the conclusion.

II
Rainfall and Irrigation

Kanyakumari district, falling within a low rainfall zone has a long history of irrigated agriculture Historically, the irrigation system consisted of a network of tanks and diversion-weirs. This century has witnessed a significant change in the characteristic of the system; large reservoirs were superimposed on the system. In 1906, the Pechipara dam was commissioned, in 1956, the Perinchani dam was added; and in 1964, the Chittar-Pattanamkal scheme increased the storage capacity further. With the construction of reservoirs, the tanks have gone into disuse, their numbers having come down from 3,045 in 1935 to 1,613 in 1962.

Turning to the variations in the quantum of annual rainfall during the last 90 years or so, it is evident that there had been somewhat of a cyclical behaviour (Table 1) In terms of deviations from the long-run average, the rainfall was deficient by over 15 per cent during 1902 to 1915 This was followed by 10 to 20 per cent above average rainfall during 1916 to 1936. The period 1937 to 1978 witnessed near normal rainfall followed by over 15 per cent deficiency beyond 1978 Although for the argument here all that is needed is the fact that rainfall has been deficient beyond 1978, the observed pattern has important implications for the expansion of area under the irrigation system, effectiveness of maintenance as perceived by the ryots, etc. For instance, during a reasonable long period of excess rainfall it is very difficult to resist pressures for extending irrigation, or poor maintenance would be glossed over.

The deficiency in rainfall has given rise to lower release of water from the reservoirs (Table 2). During a period of seven years from 1980-81 to 1986-87, the release of water as a percentage of yield was close to 100 only in one year (1981-82); during the rest of the years the deficiency was between 22 and 44 per cent of yield. Yield is computed on the basis of catchment area of the system and average annual rainfall in the catchment. (A detailed account of the computation is provided in the Technical Appendix of Nair and Narayana (1990).)

As the quantum of water release is not known before sowing, the area sown may not come down in anticipation of a deficient rainfall. And as the water released may not be equitably distributed over the ayacut, the deficiency in water release may not directly get translated into a shortfall in the area harvested to area sown Further, various methods of allocating water may be tried during periods of scarcity and supplementary sources may be exploited. Thus an indication of the extent of water scarcity may be had by the intensity of use of supplementary sources. The data from the two UR and two LR villages showed that the use of supplementary sources was absent in the former two villages. In the LR villages, their use showed a wide variation (Table 3). While in Az, in Season I, 55 per cent of the tenants were using such sources the incidence was only 29 per cent among the owner cultivators; but in Season II the percentages were 18 and 25 respectively. In Pv, although the percentages were higher among owner cultivators (12 to 14) compared to tenants (10), there was not much variation between seasons. The cost incurred per reporting household also showed considerable variation between seasons, across villages and between tenants and owner cultivators. It may be concluded that Az is the more seriously affected compared to Pv.

In sum, even during severe overall irrigation deficiency UR villages remain unaffected, LR villages get affected with varying intensities.

TABLE 3: UTILISATION OF WELLS AND PONDS AS SUPPLEMENTARY SOURCES

	Tenants		Owner Cultivator	
	Season I	Season II	Season I	Season II
Percentage of tenants purchasing water Az	54 55	18.18	28.57	24.49
Pv	9 52	9.52	14 28	11 90
Average hours for which pumped Az	12.00	13.67	13.46	12 54
Pv	*	*	*	*
Average cost incurred per reporting tenant/ owner cultivator Az	191.66	258.33	262.50	302 80
Pv	157.50	42.50	324.00	252.40

Note: * Cannot be computed because diverse sources and lifting devices have been used. Electric motors, oil motors, hand pumping and low lift using vessels have been used. So a comparable unit of measure could not be devised. Computations of cost are on a per acre basis in rupees

III
Irrigation, Uncertainty and Tenancy

In the literature on tenancy it is often argued that uncertainty and the associated risk gives rise to various forms of tenancy. The issue of tenurial forms in relation to the specific irrigation uncertainty is taken up in this section.

Before taking up a discussion of tenancy, it is necessary to provide some background information on the villages based on the census listing of households. Average land owned per household (in cents) is 39, 31, 77 and 131 in the four villages of Kn, Pv, Kd and Az respectively. The percentage of landless households is 3, 60, 28 and 7 respectively. The distribution of adult males by occupations showed that the percentage reporting cultivation is 25, 5, 28 and 16 respectively, and the percentage reporting wage labour is 33, 57, 39 and 20 respectively. The census listing failed to capture the phenomenon of absentee lessors. Among the resident lessors none leased-in land in Kn and Pv; one-third and one out of 20 leased-in land in Kd and Az respectively. On the whole, the villages are marked by certain similarities as well as differences. But in terms of none of the variables mentioned so far can the UR villages be differentiated from the LR villages

The incidence of tenancy, defined as the percentage of households leasing in to the total, showed significant variation across the sample villages. It is fairly high in the two UR villages and low in the two LR villages (Table 4). But the average size of leased-in land itself had little to do with the incidence of tenancy; it varied with the average land-man ratio for the taluk as a whole The average size of leased-in land varied from 44 cents to 136 cents in the two UR villages and from 37 cents to 94 cents in the two LR villages It is evident from the data that wherever there is irrigation uncertainty the incidence of tenancy is low.

Turning to the form of tenancy of land under paddy, in both the UR villages all the households reported fixed rent tenancy. Between the LR villages, PV reported 89 per cent fixed rent tenancy and 11 per cent share tenancy and Az reported 64 per cent share tenancy and the rest under fixed rent. If the percentage of households using supplementary sources of irrigation (Table 3) is a measure of the irrigation uncertainty then, the incidence of share tenancy is related to it.

In order to collect information on the process of change two questions were asked to the respondents: (i) the terms and conditions of the initial tenancy as distinct from the current tenancy; and (ii) in case of acute water scarcity/drought the rent rule followed. As to (i) above, in Pv for the two tenants (out of 18) who reported share tenancy the current tenancy was their initial tenancy. For one of them the tenancy was less than one-year old at the time of the survey. The second has been a tenant for over 70 years and for the entire duration the share has been 50 per cent. In Az, of the 11, eight had been tenants for less than 10 years, and six out of the eight had become tenants only during the last five years. The initial tenancy of the eight was distributed as three fixed and five share. Of the three one has become a share tenant during the last 10 years. Of the three one has become a share tenant during the last 10 years. Of the three tenants (out of 11) whose initial tenancies were over 10 years old, two were fixed and one (leasing in temple land) was share tenancy. Out of the two one had secured share tenancy in the current tenancy Overall the picture is one of moving from fixed to share tenancy in the recent past owing to the irrigation uncertainty. Such a movement from fixed to share tenancy is intense in Az where the irrigation uncertainty is also intense.

The information on rent rule during drought again brings out the relation between irrigation uncertainty and share tenancy As is evident from Table 5, the UR villages reported fairly simple rules. In Kn there was no mention of any change in the rule: if the yield of paddy fell short of the rent the latter was demanded in cash. Only in three out of 34 cases, the concession of payment during the next season was given. In Kd, it was a straight 50 per cent of yield in case of drought.[6] Between the two LR villages, in Az it was predominantly the 50 per cent rule; there were two cases where no rent was demanded and in one case fixed rent had to be paid if the yield was greater than the rent. In Pv, where irrigation uncertainty was not as intense as in Az, there were a larger number of tenants (9/20) reporting no rent or lower rent rule in case of drought; but there were an equally large number (6/20) reporting the rent rule of payment in cash after the harvest or payment during the next season. It may then be inferred that wherever irrigation uncertainty existed there was a proviso for 50 per cent rent in a drought year. As the uncertainty increased this proviso in the rule becam[e] the rule itself.

Following Table 5, it is appropriate t[o] discuss an issue which has attracted a lo[t] of attention in the literature, namely, th[e] tenant reneging the contract. When the ren[t] rule has so many provisions, knowledg[e] of the actual yield from the plot become[s] absolutely essential. How does the lesso[r] ensure it? In answering this question th[e] point raised by Otsuka et al, op cit, namely a unified treatment of land and labou[r] contracts, becomes relevant. In all the fou[r] villages surveyed, the harvesting an[d] threshing operations were carried out b[y] gangs of labour and the wage payment i[s] in paddy. Though the wage rule itself varie[d] within a village across plots as well a[s] across villages (a detailed discussion o[f] this issue may be found in Nair an[d] Narayana (1990)) what was common in al[l] the villages was the following: a fixe[d] number of kottahs[7] of paddy per acre plu[s] a share for every kottah of yield over [a] certain minimum had to be paid as wages. Such a wage rule ensured two things: (i[)] yield is accurately measured and becam[e] common knowledge, and the output i[s] amassed in one place (mostly threshin[g]

TABLE 6: DISTRIBUTION OF TENANCY BY DURATION

Duration in Years	Percentage of Tenants Reporting			
	Kn	Kd	Az	Pv
Below 3	2.94	0	23.82	9.0[illegible]
3-6	26.47	23.08	33.33	36.3[illegible]
7-10	20.59	48.72	9.52	9.0[illegible]
11-15	35.29	15.39	0	27.2[illegible]
15+	14.71	12.82	33.33	18.1[illegible]
Total	100.00	100.00	100.00	100.0[illegible]

yard) at some point of time after harvesting and threshing. This would simply leave no scope for reneging the contract.

A related issue is one of ensuring adequate application of inputs and labour under sharecropping. In the literature three possibilities are discussed: (i) landlord stipulates levels of input use and closely monitors; (ii) labdlord shares input costs; and (iii) puts the threat of termination of tenancy. Taslim (1992) emphasised the third of the above. Our data (Table 6) seems to confirm Taslim going by the fairly high proportion of tenancies of shorter durations in the LR villages. But the pattern could also be because of the unwillingness of the tenants to lease in land in the LR villages in the face of irrigation uncertainty. The fact that over 70 per cent of the tenants in Az had been tenants for less than 10 years seems to suggest the latter.

IV
Fixed Rent Paddy Cultivation

This section takes up the question of fixed rent paddy cultivation. As elaborated in the previous section, in one of the LR villages fixed rent tenancy has almost disappeared. Hence for the discussion of this section only three villages, two UR villages and one LR village, are considered.

As is evident from Table 7, the average annual rent (per acre) varied from 19.44 kottahs in Kn to 13.26 kottahs in Kd. The variation in rent across the villages is proportionate to the variation in the annual yield levels in these villages. The yield level varied from 50.08 kottahs i Kn to 32.71 kottahs in Pv. The argument that the variation in rent is proportionate to the yield levels across villages gets confirmed when the ratio of rent to yield are computed. The average for the three villages did not show much of a variation lying between 0.40 and 0.44.

It is pertinent to note here that the yield levels are not higher in the UR villages compared to the LR villages. Although it is significantly higher in one of the UR villages, 50 kottahs in Kn. it is not so in the other UR village where it is only comparable to the level in the LR village. The observed differences in the yield levels cannot be explained by the irrigation uncertainty but by the rates of adoption of high yielding varieties (HYVs) which are not entirely governed by irrigation. The adoption rate is over 85 per cent in Kn in the two seasons across tenants and owner cultivators, but is below 10 per cent in Kd. In Pv, the adoption rate varied between 35 and 50 per cent in the two seasons between owner cultivators and tenants. The observed adoption rate in Kd cannot be explained by the yield differential between HYVs and local varieties (LVs). But the yield differential does explain the difference in the rate of adoption between Kn and Pv. In Kn, the yield differential varied between 110 and 148 per cent and the rate of adoption was high. But the yield differential was not significantly different for the two varieties in Pv—the yield differential varied between 60 and 114 per cent—and the adoption rate was also lower.[6]

Taking up the question of the variation of rents within the villages across plots, it may be seen that the variation measured in terms of CV was the lowest in Kn; it was higher in Kd and Pv. What explains such variation? It may be observed that the variation in yield is high in Kn. In the face of a fairly high variation in yield if the variation in rent is low then, it implies that rents do not vary with yield. This gets confirmed when the CV of the ratio of rent to yield is computed. It was very high for Kn and very low for Pv. In a situation of adoption of HYV when the yield goes up rent also goes up. In Kn, the adoption rate being over 85 per cent most of the plots get the benefit of yield improvement. Rents go up and stabilise at a higher level given the assured irrigation and use of HYVs. But this does not happen in Pv, where rents have begun going up—on an average they are higher than in Kd—but cannot stabilise at a higher level because adoption rate has not reached a ceiling and hence not all the plots get the benefit of HYV.

In order to test the relationship of rent with yield and size of leased in land, linear regressions were run using OLS method. Regressions were run with both the independent variables. Variables with coefficients not significant were dropped and equations were re-run. The results are shown in Table 8. It is evident that in Kn with assured irrigation and high incidence of tenancy the landowners are able to impose higher rents on smaller tenants who are mostly landless agricultural labourers. This is not to be observed in Kd where the average size of leased in land was fairly high, or in Pv where in the face of irrigation uncertainty the incidence of tenancy itself is low. Hence, in both Kd and Pv rent is positively related to yield, where size of leased in land itself played no significant role. In Kn it was the size of leased in land which played a significant role in the determination of rent, being higher for small lease holders.

Overall, it may be concluded that irrigation uncertainty plays an important role in determining the rental rates. But the role itself is mediated through the incidence of tenancy and average size of leased in land. In a situation of assured irrigation, when the size is small and the incidence of tenancy is high rents tend to be higher for the smaller ones. This gets altered when the size of leased in land itself is high. Also when there is irrigation uncertainty and the incidence of tenancy is low even if the average size is small, rents tend to move with yield.

V
Fixed Rent, Incentives and Banana Cultivation

It has often been argued [Rao 1971] that fixed rent tenancy is an incentive system "permitting the tenants to capture the returns expected in consequence of their decision-making". Such incentives have taken the tenants in one of the UR villages, namely, Kn with assured irrigation, to cultivate banana, for which there has emerged an ever increasing market in the neighbouring state of Kerala. What new features have been introduced into the terms and conditions of tenancy when the crop grown is banana?

Among the four villages surveyed, banana cultivation on leased in land is

Table 8: Regression of Rent on Yield and Size

Village	Constant	Coefficients of Yield	Coefficients of Size	Adj R^2	No of Observations
Kn	21.97		–0.05 (1.962)*	0.26	13
Kd	9.16	+0.12 (2.06)*	—	0.10	40
Pv	7.65	+0.20 (2.23)*	—	0.35	14

Notes: t values are shown within parenthesis. Yield and rent are in kottahs, size in cents.

Table 9: Size, Rent and Deposit in Banana Cultivation

	Size (Cents)	Family Labour Share (Per Cent)	Rent (Per Acre) (Rs)	Deposit (Per Acre) (Rs)	Rent for Non-Deposit Paying Tenants (Rs)	Size of Leased in Land (in Cents)
Mean	36.08	61.08	3957.04	2863.47	4330.00	15.56
SD	39.51	34.85	1584.85	2002.15	1518.77	10.40
CV (per cent)	109.51	57.05	40.06	69.92	35.08	66.85
Incidence	—	—	—	65.38	—	34.62

reported to any significant extent only in one of the UR villages, namely, Kn, with 36 per cent of the area cultivated accounted for by it. The average size of leased in land for banana cultivation is 36 cents compared to 49 cents for paddy cultivation (Table 9). But the variation is much higher in the case of banana cultivation, CV being 110 per cent, compared to 52 per cent for the land under paddy.

A significant aspect regarding banana cultivation is that the share of family labour in total labour applied is very high. The average share is 61 per cent with a CV of 57 per cent. The share of family labour (FL) when regressed on the size of leased in land (in cents) gave the following equation:

$$FL = 78.23 - 0.478 \text{ Size Adj; } R^2 = 0.29$$
$$(2.56) \quad (3.08)^* \quad \text{No of obsns} = 25$$

(t values are given within brackets)

Thus, the share of FL is inversely related with the size of leased in land. The small tenants take to banana cultivation with a view to utilise their family labour. Here it is important to note that this cannot be done in paddy cultivation because the operations are time bound and lumpy in nature. In banana cultivation there exists considerable flexibility which is taken advantage of by households with family labour.

In the case of land leased in for paddy cultivation the percentage of tenants with duration of lease below three years was almost insignificant (Table 6). In the case of banana, less than 4 per cent of tenants reported indefinite duration; 7 per cent a duration of two years and for the rest—almost 90 per cent—the duration was one year only. Thus, land for banana cultivation is leased out for one year only.

The rent on the land leased for banana cultivation is to be paid in cash. The average rent per acre came to 3,957 rupees per year with a CV of 40 per cent. This was about 30 per cent higher than the average rent for land leased in for paddy cultivation at the ruling price of paddy. In the case of paddy land, it was observed that rent was inversely related to the size of leased in land but no such relationship was observed in the case of banana. No statistical relationship was observed with size or output value.

In the context of paddy cultivation the possibility of the tenant reneging on the contract was ruled out owing to the specificities of harvesting and threshing wage contracts in existence in the area. But harvesting of banana is not bound by such specificities. The sale of banana is a contract entered into by the tenant with a trader and the price may not be known to others at all. In such a situation the landowner has no way of knowing the sale value of the output from the plot or ensuring timely payment of rent. In order to get out of such a situation a system of deposits has come into vogue in banana cultivation. A fixed sum which is less than or equal to the rental value is to be paid by the tenant six months after planting. This is quite comparable to the *sewa* reported by Morooka and Hayami (1989) for a Javanese village.

The incidence of deposit is not 100 per cent. Deposit is not collected from all the tenants cultivating banana. Only 65 per cent of the tenants reported paying a deposit and the average deposit was 2,863 rupees per acre which was 76 per cent of the average rental value for the group (Table 9). The group not paying deposit accounted for 35 per cent of the total tenants and the average size of leased in land for the group was only 16 cents compared to the overall average of 36 cents (which implies that the average size for the tenants paying deposit is 47 cents). Thus, they are extremely small tenants.

Another important difference between the two groups of tenants—deposit paying and not paying—is that the rents collected from the latter are on an average higher at 4,330 rupees per acre compared to 3,759 rupees per acre for the former. Even when the amount is time discounted taking the minimum interest charged in the informal credit market of the area (24 per cent) the rents are higher by about 230 rupees. Although the smaller tenants do not pay a deposit the rents collected are higher.

Two points need to be noted regarding the deposit amount. Firstly, it is almost equal to the rent for paddy cultivation but for the fluctuations in the price of paddy. Secondly, the deposit amount as well as the rent on land under banana respond to the changes in the price of paddy (or rice). It may be observed that the trend in the price of rice is characterised by a sharp increase in one or two years followed by a small fall or relative stagnancy. A sharp increase in the price of rice is often followed by an increase in the deposit and the rent on land under banana.

VI
Conclusion

That irrigation plays an important role in shaping tenancy is known. This paper has shown how. Both the incidence and form of tenancy are governed by the irrigation situation and the changes therein. Irrigation uncertainty leads to a lower incidence of tenancy and the form itself changes in the direction of sharecropping. In understanding the terms of contract in the land market a unified treatment of the land and labour markets does help a great deal. But its application is limited to the case when the crop cultivated is a subsistence crop. Such a unified treatment is not essential for the understanding of land contracts when the crop cultivated is a cash crop

Notes

[We are grateful to Sakthi Padhi, N Krishnaji, A Vaidyanathan, V C V Retnam, G N Rao and Neelakanta Rath for comments on an earlier draft of the paper.]

1 For a recent study of literature in tenancy and related institutions see Otsuka et al (1992) and Otsuka and Hayami (1988).

2 See for instance Bardhan (1984).

3 CDAWN stands for the Coase-Demsetz-Alchian-Williamson-North School. Imperfect information theories are attributed to Akerlof and Stiglitz.

4 For a description of the evolution of irrigation system in the district see Nair and Narayana (1990).

5 For details regarding the methodology of the survey see Nair and Narayana (1990).

6 It may be noted that Kn and Kd lie on the upper reaches of two different canals. The canal irrigating Kd is very long and ends in an extremely dry stretch and it is possible that in bad years Kd is also deprived of adequate water while letting some water to the tail end.

7 Kottah is a volume measure used in this district. Although in terms of kilograms a kottah of paddy varied from 74 to 97, we have taken 97 kgs as the standard.

8 There is an argument that the straw content of HYVs is lower than that of LVs and this could be a factor in the adoption of HYVs. In the sample villages the ratio of the value of straw to value of yield was not significantly lower in Kn compared to Kd or Pv.

Approaches to Ground Water Management

To Control or Enable?

Marcus Moench

Appropriate roles for the state and local organisations in natural resource management have been the source of debate both in India and internationally. Often, states attempt to address emerging natural resource problems via centralised control mechanisms. This approach is frequently ineffective and negates the interest local populations have in developing solutions to problems that affect them before all others. A basic philosophical premise underlying this paper is that local initiative represents a wellspring capable of generating innovative and implementable management solutions to many emerging problems. While local efforts are unlikely to generate solutions to all—or possibly the majority—of problems, frameworks are needed that enable local responses to emerge wherever the initiative exists.

I
Introduction

GROUND WATER is probably India's most valuable and perhaps its most vulnerable water resource. According to some reports: "ground water irrigation already accounts for 75-80 per cent of the value of irrigated production in India" [Daines and Pawar 1987, p5]. Roughly 35 million hectares (Mha) can be irrigated from ground water—a figure which exceeds the 33 Mha of irrigation potential created through all major and medium irrigation works [Saksena 1989; Dhawan 1990a]. Beyond irrigation, ground water is the major source of drinking water for numerous cities and rural communities and serves as the main source of clean water for industry as well.

Long viewed as an unlimited 'renewable' resource, threats to ground water supplies are becoming increasingly evident. In Gujarat, for example, official estimates indicate that ground water extraction is approaching total recharge in 36 taluks and exceeds it in a further 24 [GOG 1992].[1] Water tables throughout northern portions of the state have been falling [High Level Committee 1991; GOG 1992]. Similar problems are well documented in parts of Rajasthan, Punjab, Tamil Nadu and Karnataka and may even be occurring in some sections of the huge aquifer underlying the Gangetic basin [Bandara 1977; Pant 1987; Bandyopadhyay 1987, 1989; Sims 1988; Dhawan 1990b; Krupanidhi 1987; Rai and Phaliwal 1988; Reddy et al 1992]. Dropping water tables are not the only concern, quality issues are also growing. Salinity, fluorides, nitrates and the presence of pathogenic organisms are major concerns in many sections of Gujarat [Phadtare 1988]. Roughly 65 per cent of Haryana state is underlain by saline ground water and fresh water pockets are heavily tapped [Gangwar and Panghal 1989]. Saline intrusion affects the ground water under many coastal cities.

Little is now being done to address emerging ground water problems and calls for more effective management are common [Sinha and Sharma 1987; Ghosh and Phadtare 1990b; Chakravarthy 1990; Saksena 1989]. A Model Bill for regulating ground water use was circulated as early as 1971 and an updated version was again distributed in 1992. Draft bills have been presented in the legislatures of several states including Tamil Nadu and Karnataka but have never been enacted. So far only Gujarat has actually passed any ground water legislation. All ground water legislation so far proposed takes a highly regulatory approach. This is evident, for example, in the title of the recently circulated 'Model Bill to Regulate and Control the Development of Ground Water' [GOI 1992]. The following section discusses the model ground water bill in detail. The main provisions contained in the bill are discussed first. These are then examined in relation to some of the issues facing the development of effective management systems.

II
The Model Bill

The ministry of water resources, government of India, circulated a "Model Bill to Regulate and Control the Development of Ground Water" to the states in September 1992. This Model Bill, like the others that preceded it, has no actual regulatory significance. Under the Indian Constitution, water is a state subject over which the central government has little direct authority. The model is, however, important for what it reveals of the central government's thinking (and that of many of the nation's top water specialists) on the best approach to addressing emerging ground water concerns. This thinking has potentially great influence both for the guide it provides and because of the central government's leverage over funding flows.

(A) Provisions

The Model Bill has the following 24 sections:

(1) Short Title, Extent and Commencement
(2) Definitions
(3) Establishment of a Ground Water Authority
(4) Staff of the Ground Water Authority
(5) Powers to Notify Areas for Control and Regulation of Ground Water Development
(6) Grant of Permit to Extract and Use Ground Water in the Notified Area
(7) Registration of Existing Users in Notified Areas
(8) Power to Alter, Amend or Vary the Terms of the Permit
(9) Prohibition of Carrying on the Business of Sinking Wells in Notified Area
(10) Grant of Licence for Sinking of Wells
(11) Cancellation of Permit/Certificate of Registration or Licence
(12) Powers of the Ground Water Authority
(13) Restriction on Publication of Information and Returns
(14) Service of Orders, etc.
(15) Delegation of Powers and Duties
(16) Members and Employees of the Ground Water Authority to be Public Servants. Central Act 45 of 1860.
(17) Protection Against Action Taken in Good Faith
(18) Cognisance and Trial of Offences
(19) Offences and Penalties
(20) Compounding of Offences
(21) Offences by Companies
(22) Appeals
(23) Bar of Jurisdiction by Civil Courts
(24) Power to Make Rules.

The bill's primary substance starts in Section 3. This section enables the state government to establish a ground water 'authority' and appoint its chairman and members. Although the chair's background is not defined, the members are to be "representative of the departments as are concerned with survey, exploration, development or protection of ground water" and others "who in the opinion of the government have special knowledge or practical experience in matters relating to ground water" [GOI 1992, Section 3]. The bill also enables each state to appoint, as "public servants" under the Central Act 40 of 1860, "such number of technical and other staff as it may consider necessary"

(Sections 4 and 16). Combined, these provisions enable states to create bureaucracies for controling ground water use and extraction which are under direct control of the state governments.

Once the ground water authority has been formed, the Model Bill provides for the notification of specific areas by the state where the "Ground Water Authority is of opinion that it is necessary or expedient in the public interest to control and/or regulate the extraction or use or both of ground water in any form in any area" (Section 5). Within notified areas anyone wishing to sink a well (with the exception of small and marginal farmers) is required to obtain a permit from the authority. According to the wording in the Model Bill: "If the Ground Water Authority is satisfied that it shall not be against public interest to do so, it *may* grant, subject to such conditions and restrictions as may be specified, a permit authorising the extraction and use of the water" (Section 6(3), emphasis added). Existing users are also required to apply for a certificate registering their uses of ground water with the authority within 90 days following notification of the area.[3] This application must contain details on the water source, extraction mechanism, quantities extracted, water uses, period of extraction, area served (if irrigation) and service details in addition to volumes extracted (if drinking or municipal supply). As with the grant of permits for new wells, the authority "*may* grant, subject to such conditions and restrictions as may be specified, a certificate of registration authorising the continued use of the water" (Section 7(3), emphasis added). In making its decision on both new wells and existing uses, the authority is required to consider: "(a) the purpose or purposes for which water is being used; (b) the existence of other competitive users; (c) the availability of water; (d) any other fact relevant thereto" (Sections 6 and 7(5)). Until the permit decision has been made, existing users are entitled to continue extraction as before notification. Once a permit or registration certificate has been issued, the authority: "may, for technical reasons, alter, amend or vary the terms ...with a view to limit the use of water either permanently or temporarily" (Section 8). The authority is also empowered to cancel permits and registration certificates on the basis of (a) fraud or misrepresentation in obtaining it; (b) failure to comply with conditions or breaking other provisions of the act; or (c) the emergence of a situation which "warrants limiting of the use or extraction of ground water." (Section 11).

In order to carry out its duties under the proposed act, the ground water authority is given wide ranging powers to enter, inspect, require data collection (including the installation of water measuring devices), serve notices, seize mechanical equipment, destroy any "hydraulic work," search ("with such assistance... as it considers necessary") and "exercise such other powers as may be necessary for carrying out the purposes of this Act" (Section 12). The act explicitly states that the "power conferred by this section includes the power to break open the door or any premises where sinking, extraction and the use of ground water may be going on" provided that anyone inside has refused to open the door (Section 12(2)). It also states that the Code of Criminal Procedure 1973 (2 of 1974) applies to all searches and seizures (Section 12(3)).

The Model Bill provides extensive insulation from judicial interference for both actions taken under the act and the individuals involved. Section 17 states that: "no prosecution, suit or other legal proceeding shall be instituted against the government or the ground water authority or any other officer of the government or any member or other employees of the ground water authority for anything done or intended to be done in good faith under this Act, or the rules made thereunder." Section 22 provides that: "no civil court shall have jurisdiction in respect of any matter which the state government or the ground water authority is empowered by this Act to determine and no injunction shall be granted by any court or any other authority in respect of any action taken or to be taken in pursuance of any powers conferred by or under this Act." In addition to protecting the government and its officers, the Model Bill explicitly excludes prosecution for offences under the act to be initiated without the written consent of the ground water authority (Section 18). The net effect of these provisions is to remove the standing of anyone outside the authority to appeal to the courts.

Finally, as punishment for contravening any aspect of the act, the Model Bill provides for fines and prison terms. First offences under the act are punishable by fines of up to Rs 500. Second and subsequent offences carry prison terms of up to six months and/or Rs 1,000 fine. In addition, there is a fine of Rs 50 per day for breaking the provisions of Sections 6 and 9 (new uses and well drilling)

Overall, the proposed Model Bill, if passed, would set up a regulatory system, insulated from local involvement, where power is concentrated at the state level and formally wielded by the technical bureaucracy.

(B) Issues

A wide variety of issues are inherent in the structure proposed by the Model Bill. How the bill could be implemented is uncertain. If it were implemented, the implications for community participation, equity in access to ground water resources, integrated approaches to water management, efficient water use, and the ability to evolve flexible approaches which are responsive to local conditions would be great. Furthermore, the approach would not resolve basic conflicts between emerging problems and the poorly defined nature of ground water rights.

The fact that a wide variety of issues exist in the Model Bill does not imply that ground water legislation is unneeded. Nor does it imply that centrally controlled regulatory structures are inappropriate under all circumstances. Legislation is essential. Regulation by the state may also be required for addressing specific problems or issues. State regulation is, however, probably not the optimum approach to dealing with the wide range of ground water issues now emerging in many areas.

IMPLEMENTATION

As currently structured, passing the ground water bill in the state assemblies and then implementing its provisions would face major hurdles. The experiences of states where legislation has been proposed are illustrative. Only Gujarat and Maharashtra have passed any legislation bearing on ground water. In Gujarat the legislation, an amendment to the Bombay Irrigation act, defines terms, and allocates power to regulate and license tube-well construction, control ground water use, prevent waste, and make regulations [Sinha and Sharma 1987, p 12]. Although passed in 1976, it was only formally brought into force for certain areas of Gujarat in 1988 [Jacob 1989, p 3]. According to local officials, actual implementation has never occurred. The recent Maharashtra legislation only deals with the protection of drinking water sources. It was signed by the governor on August 10, 1993 so there is little experience regarding its effectiveness. In addition to Gujarat and Maharashtra, at least two other states, Tamil Nadu and Karnataka have recently considered legislation [Government of Karnataka 1987; Government of Tamil Nadu 1990]. The acts considered by these states were similar in their basic approach to the Model Bill but tended to provide a higher level of punishment for violations. The Karnataka act, for example, provided for up to two years imprisonment for contravening any provision except well registration. Tamil Nadu's act authorised electricity supplies to be cut off for any violation. This electricity cut-off provision was also suggested for Karnataka by the central government in 1987.[3] Neither of these acts were passed, much less implemented.

The fact that states have been unable to pass or enforce ground water legislation is

indicative of two basic problems: (1) the sensitivity of the state attempting to regulate what, for landowners, is essentially an open access resource; and (2) the lack of effective mechanisms for implementation.

Under English Common Law, the basic legal structure throughout India, extraction of percolating waters with no limit on quantity is the right of every landowner [Sinha and Sharma 1987, p 10; Jacob 1989, p 2]. This right is, in theory, limited by the Easement Act and Irrigation laws which "proclaim the absolute rights of government in all natural water" [Singh 1990, p 50]. The presence of the government's claims has not, however, altered the view of virtually every well owner that they have an ultimate right to use the water in their well in any manner or quantity they please. As a result, proposals for government regulation of wells and their use are highly sensitive. Official statistics indicated that nationwide the number of diesel and electrical pump sets was 12,581,000 in 1990 [Dadlani 1990, p 12]. Governmental efforts have resulted in the completion of roughly 9.5 million dugwells, 4.7 million shallow tube-wells over the 1st through 7th plan periods [GOI 1991, Tables 31 and 32]. Well owners are one of the most wealthy and, as a result, probably one of the most politically influential rural groups. Legislation that threatens what they see as their interests is bound to face substantial opposition.

The lack of effective mechanisms for implementation is an equally large stumbling block for the proposed regulations. The physical issues inherent in policing a large number of wells located on private lands are huge. The history of rural electricity rate collection is illustrative. In most states, electricity boards shifted from metering to charges based on pump horsepower due, in large part, to tampering with the meters and an inability to collect charges.[4] Electricity Boards theoretically have the authority to cut off connections for non-payment of dues. In practice this is difficult to do when large percentages of the rural population are not paying and maintaining food production is a prime goal of the state. Even if a connection is cut off, farmers are adept at reattaching their lines illegally. If the state is unable to meter electricity and collect charges, it is difficult to see how it would be any better at metering water from privately controlled wells or regulating its use. The case of surface irrigation systems is also illustrative. Canals, gates, relatively strong organisations and established legislation should provide a greater inherent capacity for centralised control of surface systems than is present in the ground water case. Despite this regulation has proved problematic. Often "system managers... have no *effective* power to enforce the rules or the penalties for violating those rules" [Vaidyanathan 1991, p 19].

Problems with implementation are likely to be compounded by the approach taken in the Model Bill. If the bill were implemented, many well owners would probably view it as an attempt by the state to take control over their personal resources. This approach is likely to set up an antagonistic "us-them" situation. Overall, as B D Dhawan comments on the ground water regulations passed in Gujarat: "there is little hope for effective implementation of such laws which are inherently difficult to enforce in the Indian conditions of small landholdings, inadequate administrative set-up in the countryside, and eroded state of ethics" [Dhawan 1989, p 9]. Without active participation or, at an absolute minimum, passive co-operation of the local population, no attempt to regulate water use from private wells on individual farms is likely to work.

Throughout India, there is a growing focus on "people's participation" in the management of natural resources. Examples of this range from the widespread initiation of Joint Forest Management projects to the current experimentation with turn-over of irrigation systems (or system components) to local communities for management [Poffenberger 1990; Malhotra and Poffenberger 1989; Shah 1993; Vermillion 1991]. Non-government organisations have long worked with local communities to enhance their natural resource management capabilities. Current experiments often involve collaborations between state governments and major donors such as the World Bank.[5]

The above efforts still have a long way to go. In the water case, irrigation system turnover to local communities is only in the experimental phase—long-term results are not yet in. Excluding a few scattered instances, possibilities for community management of ground water resources remain theoretical. In many areas communities have developed organisations for managing ground water extraction—actual management of the resource to control depletion is, at best, rare.

Despite the lack of experience with managing ground water resources on a large scale through local "participatory" organisations, the overall tendency in current water resource management thinking is toward greater participation. As Vaidyanathan comments in the case of surface irrigation: "A management system with full user participation and control requires a radical departure from present arrangements. Although it will take time to accomplish, such a system should be the ultimate goal" [Vaidyanathan 1991, p 19] Although there is intense debate between those who favour Vaidyanathan's position and those who are more sceptical of local management capabilities, legislative structures need to provide avenues for participation and local management. Unless this is done, there is little possibility for tapping and testing the well of local initiative that could generate management solutions to many emerging problems.

As currently written, the Model Ground Water Bill would greatly limit participation by users in management of the resource. The proposed "Ground Water Authorities" would, as defined under Section 3 of the Model Bill, be dominated by officers from technical departments appointed by the state. There is no provision for user representation in the Authorities. Notification of areas is also controlled by the state and the Ground Water Authorities under Section 5. There is no provision for user involvement in defining the areas to be notified. Decision-making power over the creation of new wells and how water from old wells is used is also allocated to the authorities under Sections 6, 7, 8 and 11. Users are, in fact, explicitly excluded from direct power to influence management decisions by Section 18 which excludes prosecution for offences under the act without written consent of the authorities and by Section 22 which excludes actions taken under the act from civil court jurisdiction. In sum, the Model Bill does not envision user participation in management decision-making and seeks to limit the scope for user interference as far as possible. This runs directly counter to the widespread efforts to increase user involvement in the management of natural resources in India and worldwide.

The lack of scope for user involvement limits the ability of the state to take advantage of local concerns and initiatives. Numerous examples exist of communities and non-government organisations initiating actions to address local ground water problems. In Maharashtra, the Panni Panchayat experiments have received substantial publicity [Sathi 1989]. In Gujarat, MAHITI, AKRSP, SVRTI, VIKSAT and the Mehsana District Dairy Cooperative are all directly involved in efforts to help rural communities manage their ground water resources.[6] Similar efforts are occurring in numerous other states. While none of these efforts represents a full response to emerging ground water problems, on a local basis they have achieved far more than has been achieved through the past 20 years of attempts to pass ground water legislation.

Aside from the lack of mechanisms for tapping local initiative, significant equity concerns would emerge if the Model Bill were enacted and implemented. Regulatory structures the world over are rarely equitable. In the western US water laws and regulations

have been regularly criticised for tending to favour current users over others. In India, regulations are easily bypassed by those for whom wealth and status provide access to high level officials and the political structure. As a result, despite the provisions for small and marginal farmers, limitations on ground water use or well drilling would tend to disproportionately limit access for less wealthy sections of society. Provisions for the protection of small and marginal farmers could even increase inequity. In many cases the wealthy are able to have themselves classified as "small" or "marginal" and thus gain a substantial share of the benefits from regulatory exemptions or subsidies intended to assist the poor. Even if applied equitably, the structure of penalties for breaking provisions of the act is inherently inequitable. The Rs 500 fine authorised under Section 19 of the Model Bill are insignificant for a large farmer or business owner but may represent several months earnings for a small farmer. Furthermore, since the size of the fine is not explicitly tied to the magnitude of the violation, a small farmer could, theoretically, face the same penalty for unauthorised irrigation of one hectare as a large farmer would face for unauthorised irrigation of 100 hectares.

The equity concerns discussed above, which are admittedly common in any regulatory approach, are compounded by the concentration of power advocated by the Model Bill. In it, regulatory powers and sole authority to hear appeals are concentrated within the Ground Water Authorities. There is no independent forum of appeal for those whose interests are not represented within the authorities. Furthermore, ground water authority members are unlikely to represent all sections of society. Under the bill, members of the Ground Water Authorities are to be appointed by the government. Representatives from government technical organisations are the only group specifically indicated for membership on the authorities (Section 3). These individuals are likely to represent wealthy, well-educated, sections of society. As a result, the potential for inequitable application of regulations is great.

In a sense, one of the greatest issues in the Model Bill is the way in which it represents a continuation of the fragmented approach to water management prevalent throughout India. The organisational structure of water management in India is highly fragmented. Irrigation, rural drinking water, industrial water supply, municipal water supply, pollution control, and ground water are generally under completely independent agencies. In addition, other departments (such as agriculture, forestry and rural development) control programmes influencing water resources. Government departments often compete with each other and departmental loyalty is highly emphasised among employees. As a result, despite frequent formal attempts to encourage co-operation, effective co-ordination between departments is rare.

The formation of Ground Water Authorities proposed under the Model Bill appears to extend this fragmentation by setting up another, independent, government organisation with responsibility for a small fraction of the larger water management needs. As proposed, the authority would only have power to influence extraction and, potentially, use of ground water. It would have no authority to influence ground water supply either by initiating recharge activities on its own or by co-ordinating the actions of other agencies who's activities influence recharge. It would also have no power to regulate the range of activities that influence ground water quality. Industrial pollution, seepage from municipal sewers and agricultural return flows may be as important as the amount of ground water extracted in determining effective ground water availability. Water which is too polluted for a given use is unavailable. Approaches to ground water management that do not encompass quality are partial at best.

Overall, the Model Bill would probably exacerbate rather than reduce fragmentation issues. Given the competition which typically exists between departments, provisions for representation of the different technical organisations on the Ground Water Authority (Section 3) are unlikely to result in co-ordinated approaches to addressing ground water problems. Furthermore, with authority only over extraction and use, the two major vectors of supply and quality are likely to be ignored.

Beyond fragmentation, the Model Bill is very limited in the approach it takes to controlling ground water extraction and use. It focuses solely on developing administrative control mechanisms for regulating ground water use directly and misses the potential management opportunities represented by water markets and indirect economic levers.

The potential use of economic levers and water markets to achieve management objectives is a major trend in current water management thinking. Recent reviews of India's irrigation sector are highly critical of energy and water price policies that encourage inefficient use [World Bank 1991]. Economic levers—prices, taxes, subsidies, and market structure regulation—are increasingly viewed as key to achieving water management objectives. Direct attempts at control via regulation are increasingly recognised as drawing on only one of a range of management options available. Water markets may also be key. Research in India documents the access water markets can provide to individuals or groups lacking the capital to construct wells of their own [Shah and Raju 1987; Shah 1989a, b, c]. In other parts of the world, water markets are increasingly being used as mechanisms for efficiently redistributing water to the highest value uses—particularly during times of scarcity [Moench 1991]. Attempts to influence ground water use via shifting the agricultural market structure via, for example, the provision of marketing facilities for low water use crops and limitations on these facilities for high water use crops, are also being discussed in India.[7]

By taking an approach that seeks to regulate ground water use and extraction directly, the Model Bill does not encourage the use of market mechanisms. Furthermore, while no specific features of the bill appear to be fundamentally incompatible with the development of water markets, the institutional momentum created could be. Once a structure designed primarily for centralised regulation is in place, the tendency will be to respond to ground water problems by attempting to place further controls on use. Market-based approaches would, in contrast, suggest a flexible administrative structure designed to facilitate private transactions shifting water to the higher value-lower volume uses. Regulatory powers would still be needed to address social and environmental externalities but they would come into play primarily in cases where less direct management efforts were clearly failing.

The approach created by the Model Bill would probably be inflexible and unresponsive to local conditions. As currently conceived, the Ground Water Authorities would make management decisions based on the deliberations of their members at the state level. Being from government organisations, the members would be accustomed to dealing with management issues within standard administrative boundaries—the panchayats, blocks and districts. These units are often fundamentally inappropriate for water management [Moench 1992a, b]. Ground Water problems vary greatly both in their nature and scale. Some could be addressed by actions influencing a single micro-watershed. Others require management over large areas containing tens or hundreds of villages and incorporating large municipal areas. Effective management probably requires approaches based around natural units—the watershed or aquifer.

Physical variability is not the only issue. Social conditions also vary. In most instances, regulation under acts such as that proposed by the Model Bill tends to follow a "blueprint" with similar sets of controls being implemented in each area. Specific management approaches may, however, find local support in some areas while not in

others. With no avenues for participation of water users, information on the degree of local support is likely to come primarily in negative ways—by local resistance to implementation actions. The lack of avenues for local involvement is also a missed opportunity. In many areas, non-government organisations and communities are actively involved in ground water management. The Model Bill provides no scope for the utilisation of local management capacity in those areas where it already exists.

In sum, as proposed the system is not designed to flexibly respond to the variety of local conditions, both physical and social, that are likely to determine the success of management actions.

A final concern in the approach taken by the Model Bill is its lack of cognisance of water rights issues. The bill flows from the authority of individual states over water resources under the Indian Constitution. Constitutionally water is a state subject. In addition, the Easement Act and Irrigation laws "proclaim the absolute rights of government in all natural water" [Singh 1990, p 50]. The view of water as a "state" resource is in direct conflict with the position of ground water under English common law as a chattel to land. The proposed bill would strengthen the state's formal claim over ground water but would do little to practically enforce that claim. This could strengthen the view, already all too often encountered among users, that water problems are the "state's problems", not those of the users, and that the state should solve those problems.

Emerging ground water problems will, at some point, force consideration of water rights issues [Bhatia 1992]. Already, agricultural users are in direct competition with drinking water supply schemes in some areas [KON, GOI and GWSSB 1992]. The national water policy gives first priority to drinking water but there is no legal way of enforcing this. Rights other than the simple link between land and access to the underlying ground water are gradually being defined on the *de facto* basis of capture and administrative reallocation. The Model Bill, if enacted, would simply perpetuate this process of *de facto* changes in right structures rather than examining the underlying issues and addressing them in an internally consistent manner.

Lack of a clear rights structure inhibits management. On one level, the historical link between land ownership and a fundamental "right" to extracting ground water forms an entrenched position for opposing the state's regulatory attempts. On another level, lack of clear water rights is likely to limit the development of management approaches based around markets (clear use rights are required for transfers to occur). It also weakens the ability of less well off sections of society to protect their access to or interest in ground water resources. The basic "right" of individuals to water as a requirement for survival goes unrecognised.

III
Towards a New Structure

The broad range of issues pointed out in India's model ground water legislation are common in attempts to address the degradation of natural resources. Alternatives to greater control by the state are rarely implemented. As each new problem arises it either goes unattended or another regulation is promulgated to deal with it. The tremendous diversity of problems and situations leads either to a maze of regulation attempting to address ever more micro levels of detail or to a situation where regulations designed from afar are applied in contexts where they have little if any meaning. Detailed regulations are unlikely to be implementable and have the range of issues discussed above. Less detailed regulations will not address the highly location specific nature of most ground water problems and management options. Frameworks seeking to encourage and enable the evolution of local management systems may represent a way out of this basic contradiction.

Legislation to provide a framework for addressing emerging ground water problems is essential in India. The framework created may need, however, to act as a flexible superstructure which enables the flexible development of a range of management approaches suited to local situations rather than attempting to directly control uses. The creation of such frameworks is the fundamental component of the "enabling approach" this paper argues for.

An enabling approach deserves consideration for several reasons. First, both the physical characteristics of emerging problems and the social management context vary greatly at a local scale. Given this variation, neither uniform management approaches nor uniform organisational structures are likely to be effective. As Arya and Haque comment: "the appropriateness of an organisation would vary from region to region and therefore, each such organisation has to be developed keeping in view the local needs and responsiveness of the farmers" [Arya and Haque 1989, p 4]. Second, as the preceding quote and my comments on the Model Bill indicate, implementation of any management system requires local support. Support tends to come where local communities are directly involved in the development of management systems. Since it is extremely unlikely that a uniform structure will find support in widely differing communities, the legislative superstructure must be capable of accommodating the variation that will accompany true participation. Third, given this variation, the superstructure needs effective mechanisms for co-ordination so that ultimately water problems are addressed in an integrated manner. Finally, fourth, an enabling structure will allow society and the state to tap into whatever local initiative exists to deal with emerging environmental problems. The current Model Bill provides no avenue through which this initiative or the skills and knowledge existing in local communities can be focused on emerging problems.

The role of legislation and law as enabling frameworks underpinning the evolution of management systems rather than as attempts to create unified regulatory structures is not widely discussed. I know of no case where legislation and legal structures have been explicitly designed to encourage the emergence of diverse natural resource management systems intended to address local conditions. This role is, however, implicit in the way laws and legislation are often used in US water management debates. As a result, the US case provides insight into how an enabling approach might be framed.

Western US Case

Legislation and law in the western US are, in many ways, not utilised as ways of specifying 'solutions' to management problems but more to create frameworks within which interest groups can negotiate and implement management actions [Moench 1991]. The enabling framework that has emerged in the US has four primary components: (1) a rights structure; (2) independent negotiating forums; (3) recognised and common organisational formats for management; and (4) a strong governmental role in data collection and dissemination. The nature of each of these components varies greatly from state to state and sometimes even within states. The discussion below attempts to capture some of the key elements I see as of potential relevance for the Indian context—it is far from comprehensive.

The legal structure of water rights is a key feature in any enabling framework. How water rights are defined often determines the objectives of water management, the range of factors taken into consideration and who has standing to participate in management debates. The structure of water rights varies greatly between regions in the US. Although it is beyond the scope of this paper to examine this variation in detail, several elements seem important.

Ground water use rights in the US are often linked with land ownership as they are in India. In some areas, these rights are

modified by beneficial use, reasonable use and correlative right concepts. The beneficial use concept, where it applies, limits uses to those society defines as 'beneficial'. In practice this has included almost any non-malicious use. Reasonable use concepts limit individual rights a bit further by restricting rights of capture to overlying uses unless injury to other overlying owners can be avoided.[8] Correlative rights represent an effort to extend reasonable use concepts and specify them in detail. They have three components: "(1) overlying owners are entitled to no more than their fair and just proportion for on-site uses; (2) as between transporters out of the basin, first in time is first in right; and (3) overlying users have priority over transporters" [Goldfarb 1989, p 45].

The modifications in simple capture rights represented by beneficial use, reasonable use, or correlative rights concepts represent substantial steps toward enabling the initiation of management. Where rights of capture are unmodified, overlying landowners have a right to use as much ground water as they wish. This effectively limits the standing of other landowners or non-landowning portions of the population to influence ground water use or extraction. By limiting ground water extraction rights to "beneficial" uses, an avenue is opened for arguments against uses that do not meet goals defined by the wider society rather than just the individual landowner. While, in the US context, "beneficial" uses have been very broadly defined to include virtually any use except for maintenance of instream flows, the term itself is subjective and could be dependent on context. The term "beneficial" potentially creates a mechanism to limit private rights in ways that account for a variety of social concerns relating to how the water under question is used.

Reasonable use concepts extend social limitations on rights of capture beyond issues in how the water is used. It is no longer just a question of whether the use in question is "beneficial" but whether extraction for use away from overlying lands impinges on others use rights. Standing is, thus, created for society to intervene not just in how water is used but, if extraction for use away from overlying lands is causing damage, in how much individuals can extract. Finally, correlative rights, by limiting landowners extraction to a "fair and just proportion" of the available resource, create a foundation for social allocation of the available resource between competing users. This creates standing for an overall evaluation of the resource and the development of management plans even if damage has not already occurred.

The case of Texas provides a practical example of how such legal limitations on rights can be useful in enabling the initiation of management. In Texas, a prohibition against "waste" forms the primary restriction on use. This enables local individuals and/or the local ground water districts to initiate legal action against those who are unwilling to conserve [Moench 1991]. Waste is a subjective concept. It depends on both water availability and use patterns. A low cost, but inefficient water application technology could be seen as 'beneficial' and 'reasonable' where there is no shortage, but as 'waste' when the resource is limited. As water has become scarce, the flexible definition of 'waste' enables individuals and water management districts (local quasi-governmental administrative authorities) to encourage continued adoption of ever more efficient water use technologies and management practices. Legal action in Texas to enforce anti-waste provisions is rare. The threat of--and potential costs associated with—legal action do, however, provide an incentive for individuals to co-operate with conservation goals.

Beyond limitations on capture contained in how private rights are defined lies the concept of public trust. This concept could serve as a key component in an enabling approach. In the US, public 'ownership' of water finds partial legal expression in the Public Trust Doctrine (PTD). This doctrine was founded initially under English common law in the King's sovereign power over navigable waters. The central idea underlying it is that the state holds particularly valuable public uses in trust for its citizens. As Bird states

> The rationale for claims of right coming from PTD is that certain natural resources are so intrinsically valuable to the public that they cannot be owned by any person. Those resources are considered to be gifts of nature that ought to be preserved for the whole of the populace, their peculiarly public nature makes their adaptation to private use inappropriate [Bird 1986, pp 66-67].

Since uses are held in trust, "the state can not wholly alienate such uses, and private users cannot obtain vested rights ... that are paramount to public uses" [Walston 1989, p 585]. Because public uses are held in trust and cannot be alienated, no compensation is required when 'private' rights must be reduced in order to preserve public uses.

Public trust concepts have never been explicitly extended to the ground water context. Concepts of inalienable public rights to water resources do, however, underlie most state regulatory and management attempts in the US. Similar concepts could serve as a foundation enabling action by a wide range of organisations in India if they are articulated in ways that provide standing for NGOs and communities as well as government entities to participate in ground water debates.

Overall, rights definitions that are qualified using concepts based on social goals can enable the participation many groups in the management debate by giving them specific standing. At present, landowners can drill where they wish and pump as much as they wish. Attaching beneficial use, reasonable use, correlative or public trust limitations on their right to do this is in effect, a statement that others in addition to overlying landowners have rights with respect to ground water and that these rights must be taken into account. This lays a conceptual foundation that enables interventions to protect both individual and wider social interests.

Transferability of water rights has become a central point in the US ground water management debate. In the western US, markets are viewed by many as the most efficient mechanism for reallocating water to meet both short- and long-term needs [Sax, Abrams and Thompson 1991]. During droughts, the presence of a water market can allow short-term water transfers to high value uses, such as drinking, while at the same time compensating those from whom water is transferred. Similarly, the presence of a market in which basic water rights can change hands enables new uses to emerge while protecting old users from a sudden—and often uncompensated—administrative reallocation of a basic resource on which they depend. Despite these potential advantages, water transfers often have major side effects. In many areas, water availability is heavily dependent on return flows or seepage from other uses. If primary users are able to transfer water, third parties dependent on the return flows often lose. Third-party effects of transfers can extend beyond the immediate body of right holders. Major transfers of water out of basins or regions are often perceived as undermining the local socio-economic base [Macdonnell and Howe 1986; Checchio 1988; Shupe 1988; Nunn and Ingram 1988; Oggins and Ingram 1990; Woodard 1990]. This has become known as the "area of-origin" problem. When water is transferred out of a region, the economic activity it supported can go with it. Similarly, many environmental values—from the maintenance of stable water tables to wetlands—can be affected if water transfers become common.

Overall, water rights must be defined in a transferable manner if markets are to play a major role in water management. At the same time, transfer rights must be defined carefully if third parties are to be protected. All states in the western US now follow a "no injury" rule with regard to water transfers [Sax, Abrams and Thompson 1991].

This often results in extensive regulation of transfers which increases transaction costs greatly. To meet both efficiency and wider social goals through market mechanisms necessitates the definition of water use-rights in ways that are transferable and yet minimise the transaction costs and third-party effects of transfers [Emel 1987].

Translating standing and the presence of social limitations on private rights into the power to initiate or modify management practices requires a forum for the rights to be exercised and enforced. In the US, the court system provides the ultimate forum for dispute resolution. Some states, such as Colorado, even have special water courts that deal with a range of specific water rights issues [Sax, Abrams and Thompson 1991]. Courts are, however, not the only forum through which rights disputes are resolved. In many cases, the presence of rights and the threat of long, expensive, legal processes are sufficient to force interest groups to reach agreements through negotiation or arbitration. Negotiated management agreements representing compromises between a wide variety of local or regional interests often result. These negotiated solutions frequently lead to divisions of management authority so that various interest groups have a continuing say over management decisions [Water Strategist 1990; Shupe 1986]. This approach enables the gradual evolution of management systems that reflect local conditions and are flexible in the face of change.

In the US, special 'districts' with quasi-governmental status are the most common form of water management organisation. Many of these are primarily concerned with irrigation. Despite the single name, irrigation districts are far from uniform. They often have a specific array of structural features, powers and functions matching the desires of their local constituents. As a result, the irrigation district "model" provides a good example of an approach that enables the development of management organisations closely tuned to the local context.

Despite the widely varying nature of districts, certain structural features are common to most. Sax, Abrams and Thompson (1991) have outlined these well. According to them:

> To form an irrigation district, a majority of landowners within the boundaries of the proposed district must normally petition local officials. Most states then investigate and report on the adequacy of the proposed district's water supply, although typically the report is purely advisory. A formation election is finally held, at which a majority of the proposed district's residents—in some states, two-thirds or more of the residents—must approve the idea.
>
> Once organised, the district can appropriate water, construct reservoirs, canals, and other irrigation works, and distribute water for a fee to the district's residents. Most districts also have the authority to engage in related functions such as the production and sale of hydroelectric power. Districts moreover enjoy a number of uniquely governmental powers including the power to (1) assess (i e, tax) property within the district, (2) condemn property (including water rights), and (3) issue bonds the interest of which, under current tax laws, is exempt from federal income taxes. Because irrigation districts are technically subdivisions of the state, they are also exempt from state property tax."

Districts are governed by their boards of directors, the members of which are generally elected by the districts landowners [Sax, Abrams and Thompson 1991, p 628].

Not all districts or district like management entities are formed by votes of the populace. The Arizona Groundwater Management Act (one of the most comprehensive regulatory pieces of legislation dealing with ground water in the western US) enables the designation of "Active Management Areas" (AMA)—effectively management districts. This is done in three ways: (1) legislation; (2) designation by the director of the department of water resources; and (3) by petition and vote of the local residents [Sax, Abrams and Thompson 1991]. By identifying different avenues for AMA formation, the act enables the formation of management entities to be initiated either by individuals at the grass roots level or by the legislative and administrative branches of government.

In addition to similar methods of formation and a common array of quasi-governmental features, irrigation districts generally have rules for water distribution that allow discretion during periods of shortage and often enable reallocation as changing needs require [Sax, Abrams and Thompson 1991, p 629]. In some cases, they also provide regulatory structures that allow water trading through market processes. District enabling legislation also often attempts definition of the individuals and groups with standing to participate in and/or initiate management debates. These might be landowners or the residents of a proposed area.

Data are a fundamental currency for management. Without information on ground water resource characteristics and use patterns it is often impossible to detect emerging problems and certainly difficult to devise appropriate management solutions. In India, ground water data are generally viewed as the private domain of government agencies. Their distribution is often restricted due to political sensitivity and the general proprietary approach followed by government agencies to anything they can control [Singh 1983; Dhawan 1990b]. While the availability of ground water data in the US is far from perfect, both the state agencies and US Geological Survey produce large amounts of data. Dissemination of this data to interested parties is generally unrestricted.

Access to information for all parties is often a key factor in the evolution of management agreements. A common understanding of physical relationships and the probable effects of different management actions provides a basis for negotiating agreements. As Baker and Romm point out: "Until the benefits of co-operation can be quantified for each party, it is not feasible to expect a user or user group to invest resources in the co-operative effort" [Baker and Romm 1990, p 6]. This leads them to view technical inputs such as hydrologic models as neutral "negotiating texts" that enable different interest groups to reach common agreements on management needs and appropriate actions

Potential Applications in India

Although the experiences with ground water management in the US cannot be transferred directly to the different environmental, socio-economic and cultural context of India, key elements may be relevant.

The role of rights definitions as key factors determining the ability of different interests to have a say in water management seems fundamental. Although the importance of formal rights definitions is often discounted in the Indian context, perceptions of rights do play major roles. As Walter Coward found in a study of khul systems: "rules actually are useful in structuring the broad relationships among the various groups and individuals with a claim to water..." [Coward 1990, p 83]. In this case, the right structure formed a basis for determining maintenance responsibilities as well as water allocation. In my field work, individuals often express the conflicting views that they "have no right to influence how an individual uses water from his well" but do have a "right to protest actions that damage their wells or the resource in general " Legal rights definitions that strengthen the second of these perceptions would support a communities ability to challenge individual uses and, thus, could enable the initiation of community-based management actions.

The issue of rights definitions in India seems important from another perspective. Water transfers are common. In Gujarat, most surface irrigation projects are now linked to municipal supplies.[9] Well fields developed to supply drinking water to 200+ km long pipeline projects are in direct competition with surrounding agricultural users [KON 1992]. In some coastal areas, farmers affected by saline intrusion are

purchasing land inland and piping ground water out to their fields [Bromley 1989]. These transfers are occurring on an *ad hoc* basis with potentially large impacts on users. In some cases, farmers are losing access to the basic resource required for productive agriculture. In other cases, agricultural users undermine drinking water projects designed to meet the survival needs of communities. In the absence of a rights structure that addresses transfer issues, existing users have no claim to compensation if a resource essential for their physical or economic survival is captured by others. If rights structures that allow water transfers and account for third party impacts can be designed then water markets could address both transfer needs and provide a source of compensation to those whose access to water is reduced. While rights issues are complex, they seem central to addressing emerging ground water problems in India.

The existence of an independent dispute resolution forum also seems to be fundamental to enabling the development of local management approaches. Rights have little meaning unless they are to some extent enforceable. Furthermore, if dispute resolution authority is held by an organisation directly involved in ground water use or management, the potential for biased decisions increases. This is likely to undermine the willingness of different interest groups to co-operate with management decisions. Since, in the Indian context, state enforcement of management decisions affecting ground water use appears impossible, the co-operation of local communities seems essential. Independent, impartial forums through which the range of actors can negotiate thus seem central to the development of effective management systems. Provisions such as those in Section 23 of the Model Bill that ban the involvement of the civil courts run counter to this need. While civil court system functioning in India is problematic, some independent forum seems essential.

While rights and forums for expressing them are important, they are unlikely to have much impact unless information on resource condition is generally available. Individuals in India are generally well aware of falling water-tables or declines in water quality on a very local scale. Overall understanding of resource dynamics is, however, often limited. Given the general level of education and technological availability, engineering approaches involving hydrologic models may be of limited use for local communities in India. Some common understanding of emerging problems is, however, essential as a basis for agreement on management needs. As part of an enabling framework state and central government organisations in India could play a role similar to that played by the Geological Survey and state technical organisations in the US as major sources of technical information for all interested parties.

Finally, the presence of recognised institutional forms for management seem would seem central to any basic enabling framework for India. The "district" model is an example of this in the US case.[10] Although the nature of districts varies greatly, the basic model represents a recognised and accepted form of management organisation with: (1) a range of quasi-governmental powers the organisation can draw on; (2) financing mechanisms for organisation support; (3) mechanisms for organisation creation; and (4) a means for specifying the range of activities an organisation can take on.

No institutional form similar to the district exists for natural resource management in India. Village co-operatives are often formed to manage natural resources on a very local basis. Major problems have, however, been encountered with this form of organisation. Natural resource management often is not an income generating activity. Co-operatives also do not typically have the quasi-governmental powers either for fund raising or for enforcing management decisions that are commonly associated with the US districts. As a result, natural resource management cooperatives are often ineffective.

Net Result

The combination of rights definitions, dispute resolution forums, data availability and the "district" model that underlies management institution development in the US does not represent a comprehensive framework enabling appropriate management responses to emerging problems. Many workers might, in fact, disagree that any ground water management framework exists at all. It is, as David Getches (1984) comments a "fragmented system". Although the legal and legislative superstructure contains many concepts and provisions that enable the development of local management systems, the net result does little to insure that local approaches coalesce into rational management responses at higher levels. Fragmentation reflects a long history of un-coordinated local decisions. It does not the outcome of a co-ordinated effort to create an overall system designed with the specific purpose of enabling the evolution of locally responsive management approaches.

I am unaware of any attempt to define the key components required for a more comprehensive enabling approach. The following section represents a very preliminary and admittedly partial attempt to do this.

A range of components seem important for creating a framework that would enable the evolution of management approaches and institutions that are both responsive to local conditions and result in an integrated approach to water management needs at a higher level. These components include, but are not limited to, those I have outlined above that appear to be important in the US case. They consist of:

— Rights structure that voice social imitations on private uses, recognise the standing of individuals and local organisations and yet allow for water transfers;
— Neutral negotiating and dispute resolution fora;
— Mechanisms for initiating the process of management area formation;
— Recognised management organisations with access to a clearly defined set of powers and financing;
— Structures for information generation and dissemination;
— Mechanisms for co-ordination.

Clear definition of basic rights and the standing of individuals or organisations to protect those rights is essential for the development of management systems.[11] In addition, where scarcity is an issue, rights are likely to come in conflict. Some mechanism for ranking rights is therefore essential

As previously noted, concepts such as beneficial use, reasonable use, correlative rights and public trust provide for the expression of interests beyond those of the individual in how water resources are used. In India, the national water policy ranks water use priorities with drinking needs first, followed, respectively by agriculture and industry. While this policy does not have the force of law, it represents a ranking of social objectives that place basic survival needs over other uses. Individual rights to pump ground water from below their land are still unchallenged.

An overall water rights approach that defines individual rights clearly and transferably yet limits on them through a combination of: (1) public trust, correlative rights, beneficial use and reasonable use concepts and (2) a ranking social objectives (as the national water policy does) could lay the foundation for negotiating water management approaches that represent the interests of both individuals and the wider society.

Defining rights on a volumetric basis (as many states in the US attempt to do) would be extremely difficult under Indian conditions. An alternative would be to continue to define rights on the basis of capture but limit them to uses that are beneficial (not wasteful) and reasonable (not infringing on the rights of other individuals

or the society). Social interests could be protected through a Public Trust approach. "Public Trust" rights might include: (1) the right of succeeding generations to a basic ground water resource system undiminished in quantity or quality and (2) the right of populations to sufficient water to meet survival needs. It is important to note that, in addition to narrow protection of public interests, careful definition of "public trust" rights could provide a foundation for integrated water management.

For the rights foundation to be effective, individuals and organisations would need recognised standing to defend their rights or the rights of those they represent. In India, water is constitutionally a state subject. State governments and bureaucracies generally seek to minimise the ability of individuals, local communities and other organisations to intervene in water management debates or activities. This leads to centralised approaches which are unresponsive to local needs, conditions, or perspectives. As a result, a clear definition of standing for individuals, communities and NGOs to participate in water management debates seems essential to the basic enabling framework.

The need for an impartial and independent dispute resolution forum as a basic element enabling local management has already been discussed in detail. It is important to recognise, however, that an appropriate forum could do more than just enable management. By providing an avenue through which a variety of local interests can express their needs and concerns, the forum could go a long way toward addressing equity issues.

As previously noted, in the US the courts usually provide the ultimate dispute resolution forum. Other forums—independent arbitration services, local water courts, or elected boards representing the full range of water interests—could potentially be appropriate in the Indian context. No single forum may be appropriate in all situations. Major procedural delays and corruption are acknowledged to limit the viability of using the civil court system for resolving water management disputes. As a result, a general enabling framework might provide for the formation of local dispute resolution forums of a type negotiated by all interest groups within an area proposed for management. This could be done under the auspices of a permanent state level forum.

The presence of a rights structure and dispute resolution forum would create one avenue for the identification of areas where management is needed. Disputes would, presumably, arise in sites where emerging resource problems have significant impact on use values. The process of negotiating a solution would then lead to identification of problem area and the creation of some management solution intended to address them. This approach is, however, limited. In many areas where the overdevelopment of ground water is occurring disputes do not immediately arise. Long-term declines in the water-table may not, for example, generate disputes because they do not necessarily influence the amount of water individual well owners are able to extract. Declines may, however, indicate unsustainable extraction patterns that would result in long-term damage to the basic resource. As a result, reliance on disputes as the sole mechanism for initiating water management debates is unsatisfactory.

An enabling framework could create several avenues in addition to the emergence of disputes for initiating the process of management area identification. Process triggers could be based on a set of physical or environmental indicators and/or on the interest of local users in initiating management.

The previously noted case of Arizona provides alternatives to dispute initiated formation. There, management area formation can be initiated by a petition and vote of local residents, the state Department of Water Resources (DWR), or by the legislature. Where residents recognise and wish to take action on an emerging ground water problem they can file a petition for a management area to be formed. This petition is then voted on by people in the proposed area. If the petition is approved, the process of area formation goes forward. Where local residents are not coming forward, the director of the DWR is authorised to initiate management area formation by showing "that active management practices are required to preserve ground water for future needs, or that the current withdrawals are causing subsidence or diminution in ground water storage capacity, or that degradation of ground water quality is occurring" [Sax, Abrams and Thompson 1991, p 497].

Overall, an enabling framework should probably seek to identify a variety of avenues for management area formation. In some cases, local residents may display a strong concern over emerging problems. Where this concern exists, avenues that enable initiation through local action are likely to encourage support for both the organisation that emerges and for any management system it develops. In other cases, local groups may not be interested in initiating management and the state needs to retain the option, where specific problems are clearly emerging, for initiating action to protect larger social interests.

Finally, in addition to identifying avenues for management area formation, any enabling framework needs to ensure that proposed areas will form effective management units. Administrative and political boundaries often do not match hydrologic boundaries. Ensuring that management areas are defined in ways that reflect the underlying hydrologic system is essential if emerging problems are to be addressed effectively. Reviews of the hydrologic viability of proposed management areas should be an integral part of the formation process.

Management Organisation

Management cannot occur in the absence of organisations with recognised authority and powers for influencing resource use. The organisations also must be self-sustaining. To do this their structure and powers must be compatible both with the range of functions they are expected to take on and with the modes of organisation their initiators are comfortable with. They must also have clear source of financing to support their activities and staff.

Since needs and functions will vary greatly from site to site, any framework intended to enabling locally appropriate management structures needs to identify a range of acceptable organisations for ground water management. No single organisation format is likely to match the range of conditions present in all local situations. Potentially appropriate organisation types include: (1) quasi-governmental "districts"; (2) co-operatives; (3) companies, partnerships, utilities and other "private" institutions; (4) trusts, and (5) government agency.

The organisational format most appropriate in any given situation is likely to depend heavily on management needs and community interest. Where, for example, protection of a specific area is required to meet the drinking needs of an individual community or provide a drought reserve, trusts with management powers to protect these needs could be the most appropriate institutional format. Where water distribution is the issue and potential for income generation through the provision of services exists, co-operatives or private organisations could be applicable. A "district" approach might appropriate in more complex situations where income generation possibilities are limited and large-scale, integrated, management activities are necessary. Finally, management through government agencies could be essential where scale or local disputes constrain the ability of local groups to negotiate effective approaches. Overall, legislation seeking to enable the evolution of management institutions suited to local conditions should provide formal recognition for a variety of organisational structures.

Beyond the question of organisation structure lie the questions of financing and management powers.

Organisations do not last unless they have clear sources of revenue. Either the services an organisation provides must be capable of generating income or it must be capable of raising funds through other means. As previously noted, in the US districts have taxation powers. Many of them also generate income through sale of hydroelectric power or water fees. Government funding is also provided in some cases. In India, community contributions are widely viewed as critical to the effectiveness and sustainability of local resource management efforts. Unless individuals contribute directly to the management organisation, there is little sense of local ownership or of responsibility to co-operate with management efforts. As a result, financing mechanisms should probably depend on local sources of revenue as far as possible.

In addition to financing, access to authority—recognised powers—is essential for management to occur. the types of power appropriate to allocate to an organisation will depend both on organisation type and management needs. They are likely to vary greately. In some cases, realtively non-controversial powers—the authority to raise funds for construction of recharge structures, education, technology diffusion, etc—may be sufficient. In other cases, effective management may require the development of permitting systems, extensive monitoring, well and extraction regulation, and water reallocation mechanisms.

An enabling framework will probably need to contain recognised set of powers potentially useful for ground water management and mechanisms for different organisation types to draw on those powers. One approach might be to define the range of activities different organisation types are likely to undertake and define the range of powers they may need accordingly. Actual authority to use specific powers could be enabled via inclusion in the organisation's bylaws. This approach might, for example, result in a hierarchical power structure where private and co-operative organisations have the authority to distribute water within specific service areas, trusts can limit use within a region to protect specific interests, and districts have the authority to develop overall management plans and promulgate regulations to enforce them Another approach might be to develop a 'smorgasbord' of potentially useful powers and then create mechanisms for different organisations to gain the authority to utilise specific ones. As the degree to which powers could restrict individual or group use rights increases stronger mechanisms are required to ensure that the powers are actually needed and equitably applied. The approach could, for example, contain general authorisation for any organisation to undertake educational or other non-invasive activities. Licensing, permitting, extraction regulation, authority to encourage or regulate water markets, and other powers having a strong potential to limit individual uses might require approval by the local population (via a vote) or authorisation based on clear demonstrations of need through the independent dispute resolution forum. Finally, rather than identifying potential powers in advance, the approach could be to allow local organisations to identify whatever powers they need and focus instead on creating a mechanism through which powers could be created and approved both by the state and community.

Whatever avenue is developed, the overall goal should be to create a flexible system containing a series of checks and balances through which organisations can gain the authority and specific powers necessary to initiate effective management actions.

As noted in the discussion of the US case, data are a fundamental currency for management. An enabling framework needs, therefore, to create a system through which basic information on resource condition is made available to all interested parties. At present, many communities in India do not have access to the technical tools and training found in the US. Dependence on sophisticated hydrologic models—or even relatively simple analytical calculations—can limit the ability of these communities to engage in debates over resource condition [Moench 1992a, 1993a]. At the same time, many direct indicators of resource condition exist that are readily understandable even by illiterate groups. Villagers are generally unable to challenge the scientific accuracy of recharge and extraction estimates—but they understand the significance of dropping water tables and salinity increases.

An information system that generates data suited to different levels of user sophistication and distributes it widely could be a key element of an enabling approach. Maps indicating water-table and water quality trends or other basic parameters could serve as the primary coin for water management debates. Sophisticated modelling approaches would be used in a more limited range of situations where understanding of system dynamics requires their application.[12]

The existence of mechanisms ensuring that most activities influencing ground water condition are incorporated in management approaches seems to be the final basic requirement for an enabling structure. An enabling framework that attempts to generate a wide variety of different approaches suited to local conditions runs the risk of creating a "fragmented system". There is no assurance that local management systems, just because they are local, will take an integrated view of resource management needs. In many cases, local interests could generate management approaches that conflict with other local interests or regional management needs.

Conflicting approaches and organisations are an inherent problem in the current structure of water management in India. Individual agencies generally have responsibility for irrigation, ground water, municipal water supply, rural drinking water and so on. Often development plans are initiated by one agency that directly conflict with the actions of other agencies. There is no effective mechanism for co-ordinated water resource planning.

As part of an enabling framework, specific mechanisms need to be developed to ensure that local management is sufficiently comprehensive to incorporate the range of local issues and needs and minimise conflicts with neighbouring regions. A variety of mechanisms could be used to achieve this goal. The management area formation processes might, for example, mandate a review of water management needs, existing activities, and potential points of conflict before an organisation could be formed. This could be done both for the proposed area and for the surrounding region. Alternatively, all management organisations could be required to file regular management action summaries with an independent commission. This would review the summaries and, if any points of conflict were identified, have the power to require the organisation to resolve these by itself or through the dispute resolution forum. A third approach would be to rely on comprehensive rights definitions and the dispute resolution mechanism to gradually force the inclusion of all management needs into a single structure. This approach would require rights definitions that incorporate "public trust" or other concepts voicing broad social interests. It would also require the existence of organisations (such as environmental NGOs) with an interest in and formal standing to defend the public interest.

Many possible mechanisms for encouraging an integrated approach to ground water development exist in addition to those identified above. The main point here is that any structure that encourages the development of locally appropriate management systems needs some counter-balancing mechanism to ensure that these local systems are, if not in full harmony, at least not in direct conflict. This will necessitate the creation of some technically competent organisation at the state, and perhaps national, level with the authority to review local management approaches and initiate action (perhaps via reference to an independent negotiating forum) to

bring them into line with larger water management needs.

IV
Summary

A wide variety of ground water management problems are emerging in India. In some areas water-tables are falling rapidly, in others it is rising and in yet others quality is declining. Often problems show a high degree of local variation both with regard to their physical character and their causes.

Despite great local variation in the nature of emerging problems, proposed approaches to dealing with these problems are unidimensional. The Model Bill circulated in September 1992 by the Ministry of Water Resources proposes the formation of water management agencies with a single clearly defined approach and set of regulatory powers. This approach is likely to be unresponsive to the widely varying characteristics of local problems and may not be implementable. Furthermore, a number of equity, community participation, and rights issues are likely to arise if the approach goes forward.

This paper argues that, instead of creating a single centralised framework for regulating ground water, it may be useful to create a legislative superstructure that would enable and guide the formation of locally appropriate management institutions and approaches. Key elements of this superstructure could include: (1) rights definitions through which public interest in ground water use can be expressed and standing can be created for individuals or organisations to defend that interest; (2) a neutral negotiating and dispute resolution forum; (3) management area identification mechanisms; (4) recognised organisational forms for ground water management with associated financing mechanisms and powers; (5) a system for information generation and dissemination; and (6) co-ordination mechanisms to integrate local approaches with regional needs and counterbalance the tendency toward fragmentation inherent in decentralisation.

An enabling approach could create numerous opportunities for communities to participate in ground water management. By doing this it would allow society as a whole to tap into the wellspring of concern and management capabilities that exist both at local levels and in the government. An enabling approach would not immediately address the full range of fragmentation, environmental and equity problems that are emerging with regard to water resources. It could, however, provide a framework and set in motion a negotiating process that would lead to their ultimate resolution.

Notes

1 Greater than 65 per cent of available recharge in the first 36 taluks is extracted.

2 The 90-day restriction may be waived if the authority is "satisfied that the user was prevented by sufficient cause from filing the application in time" (Section 7).

3 Letter from the secretary in the Ministry of Water Resources to the chief secretary, Government of Karnataka, dated August 24, 1987.

4 Based on discussions with Electricity Board officials in Gujarat, Tamil Nadu and Karnataka in 1991-92

5 The World Bank is, for example, supporting irrigation turn over activities in Maharashtra and Gujarat

6 VIKSAT, AKRSP, MAHITI, and SVRTI are all non-government organisations working in the field of rural development and natural resource management.

7 Workshops held at VIKSAT, February 18, 1993 and May 17, 1993.

8 Reasonable use-rights are similar to (and derived from) the concept of *riparian* rights which applies to surface waters in many areas. *Riparian* rights allocate uses to lands bordering watercourses within a single basin. In principle, they entitle each riparian owner to "a stream flow through his land in its natural condition, not materially retarded, diminished, or polluted by others" [Goldfarb 1989, p 22].

9 Discussions with S C Sharma, chief hydrologist, GWRDC.

10 Mutual irrigation companies (owned by their stockholders) are also a common water management organisation in the US. There is no requirement for management to occur only through one type of organisation—multiple forms could have advantages

11 Including compensation for 'takings', the right to drinking water as taking precedence over the right to extract ground water from over lying lands

12 For further discussion of data and information alternatives see Moench (1993b)

Towards a New Water Institution

Economics, Law, and Policy

R Maria Saleth

The widespread and persistent symptoms of an imminent water crisis are a clear testimony for the failure of our current water-related policies as well as the instruments and institutions through which they are implemented. It is now time to seek more durable, though politically harder and technically challenging, options like the institution of a water rights system. What is the status of the issue of water rights in current policy? What are the legal, economic, and physical characters and requirements that a water rights structure should satisfy? Do we have enough institutional and technical potential for instituting a water rights system capable of tackling the critical issue of water distribution between uses and users that too both across time and space?

I
Introduction

WIDESPREAD aquifer depletion in the ground water areas, waterlogging and soil salinity in the canal regions, and water and soil salinisation due to sea water ingress in the coastal zones are undeniable symptoms of an imminent 'water crisis' in India. The water crisis has both quantitative and qualitative dimensions the relative seriousness of which varies across regions depending on their demographic, agronomic, and geo-hydrological conditions. Although rapid demographic growth and expansion of water-intensive technologies and cropping pattern have aggravated the crisis, it is now widely recognised that the epicentre of the problem lies in the current social, economic and legal policies and the institutions governing the water resource development, distribution, and utilisation. Unless these policies and institutions are radically transformed and reoriented to focus on the hitherto neglected sustainability and equity dimensions of water resource development, the water crisis and the attendant water-related disputes are likely to culminate in still more diabolic economic, social and, even, political crises. Therefore, there is an urgent need to search for more durable, though politically and administratively harder, options like the institution of a water rights regime that could effectively limit and regulate both individual and collective water withdrawal and use both from surface and sub-surface sources. It is in this context that the national policy for the institution of an effective water rights regime assumes pertinence and significance.

The main aim of this paper, in this regard, is to address the following questions: Why do we need a national policy centred on a water rights regime? What are the economic rationale for a water rights regime? Where does the issue of water rights stand in current policy and literature in India? How do our current water institutions compare with those in other countries? What are the economic and institutional requirements that a water law reform should satisfy for establishing a technically feasible water rights regime in the Indian context? Could we outline an ideal or most desirable framework for a water rights structure consistent with our social ethos and development requirements? What are the institutional potential and prospects for actualising such a water rights structure? Although the main focus is here on the economic and institutional dimensions of these and related questions, their legal dimensions will also be addressed to the extent they have economic and institutional implications for the water rights system.

II
Need for Water Rights System

Although legal reforms are urgent in all spheres of environment and resources such as land, forest, energy and estuaries, water law reform assumes still more significance in view of the special role water plays in human survival and progress. Water not only caps the absolute needs of human beings (and also animals, plants, etc) but also forms the basic input for producing other basic needs like food and fish products as well as modern needs like power generation and navigation. Unfortunately, the irrigation and water-related acts passed both during and after independence are unable to effectively tackle the current requirements for sustainable use and management of water and water-related resources. They are not ecologically-oriented, nor can they ensure economic efficiency or distributional justice

Irrigation and Agricultural Sustainability

While water law reform centred on an effective water rights system should cover all uses of water, the issue is particularly important for irrigation water which has significant implications for agricultural sustainability.

Firstly, in a monsoon-dependent agrarian economy like ours irrigation is critical both for improving and sustaining agricultural production and productivity. The ever-increasing demand for food and other farm products induced by population growth and economic development cannot be adequately met without a dependable irrigation system performing both a protective role against the vagaries of nature and a productivity-inducing and land-augmenting role for enhancing resource productivity.

Secondly, irrigation, at present, accounts for more than three-fourths of our total national water use [Government of India (GOI) 1993]. And, such a pre-eminent position of irrigation is unlikely to be altered much even by 2025 AD by the increasing water demand for meeting both non-irrigational needs like drinking, domestic and industrial purposes as well as non-consumptive uses like navigation and power generation [GOI 1976: 9].

And, thirdly but more importantly, even though irrigation accounts for a large share of our total created water resource potential, its share cannot fully meet the irrigational needs of even the currently cultivated area, not to say about the area likely to be expanded in future. Even if we could develop fully our water resource potential, only 60 percent of our cultivated land can be irrigated [Dhawan 1992: 265]. Given the increasing cost of creating additional irrigation potential, it stands to reason that the additional benefit from an improvement in use efficiency of the existing irrigational potential through a proper inter-personal and inter-regional distribution could very well surpass that from the creation of additional irrigation potential for which there is an upper limit specified by hydro-geology and technology.

Incentive Gap

The major threat to the sustainability of our irrigated agriculture is going to come neither from the frequently alluded 'utilisation gap', i e, the gap between our water resource bounty and the extent of its use, nor from the so-called 'irrigation gap', i e, the gap between our irrigation demand and the irrigation potential created so far; but from the persistence of the 'incentive gap', i e, the gap between the scarcity value of water and the value underlying the current pattern of water utilisation and management [Saleth 1991a]. In fact, both the utilisation gap and the irrigation gap could be reduced, if not eliminated altogether, by correcting the incentive gap which is evidently a product

of the existing institutions governing water acquisition, distribution and utilisation.

What is astonishing is not the fact that the current legal and institutional basis of water management fails to provide sufficient economic incentive, but that it actually engenders a wrong kind of incentive structure! While the farmers' perception of excessively subsidised canal water as a public good induces them to maximise water per unit of output rather than to maximise output per unit of water leading thereby to water over use, the unrestricted 'open access' character of ground water instigates a process of competitive water withdrawals culminating eventually in aquifer depletion. It is this kind of incentive system that underlies the paradoxical phenomenon that unlike other economic goods where scarcity prompts efficiency and conservation, water resources continue to be depleted and misused under the very condition of increasing scarcity. Much more serious than the economic problems emerging from the incentive gap is the horde of ecological damages like waterlogging, water and soil salinity/alkalinity, sea water intrusion, land subsidence, etc. These ecological degradations are often attributed to the phenomenon known in economic literature as 'market failure'.[1] But, market failure itself is caused by the absence, failure, or even the inability of the legal framework to establish and enforce an effective property rights regimes in natural resources.

The efficient operation of the economic institution of market that guides resource allocation and use in the economy is predicated on the legal framework, especially the property rights system that establishes the initial resource endowment of individuals. The market failure observed in the allocation and utilisation of water is an eminent case in this respect. It is abundantly clear that without correcting the fundamental incentive gap through a radical transformation of the existing water laws and institutions, it is not possible to ensure either ecological security or economic efficiency or even social equity in water use. Therefore, water law reform focused on a clear-cut and prioritised water rights is indispensable for the very sustainability of our irrigated agriculture as it ushers into the 21st century.

Failure of Current Regulatory Regimes

There was a time when India had many informal grass roots level institutions built around widely subscribed social conventions and moral principles. These institutions were very successful in enforcing an orderly use of common property resources including water at the local level. Unfortunately, due to a gradual separation of ownership and usage of natural resource effected through a series of colonial and post-independence legislations, the indigenous institutions have been severely eroded almost to the point of extinction. Although effort has been made to revive these institutions through panchayat raj as well as through peoples' participation, these cannot be relied whom to provide the desired decentralised institutional structure for resource conservation unless the ownership and control of the resource are restored to the ultimate users.

In view of the absence or ineffectiveness of local institutions, there has been a misplaced emphasis on centralised attempts to regulate water use. Various regulatory policies based on well siting and licensing norms, power tariff and supply manipulations, and even on newly emerging institutions like water markets and user-oriented irrigation co-operatives, have been followed but with little or no success. Our continuing belief that these superficial regulatory regimes will by themselves provide a durable solution to all the critical problems facing our water economy under the prevalent institutional conditions is going to be costly not only in economic but also in social and political terms.

Since the water zonation-based well-spacing and licensing regulations are implemented indirectly through credit and power connection policies, they are easily bypassed by well-endowed farmers [Dhawan 1989: 44 45]. Apart from their inability to control resource depletion and ecological degradation, they are inequitable as they restrict the new entrants who are mostly resource-poor farmers, and, more importantly, offer no protection to the poor farmers relying on traditional water-lifting technologies [Dhawan 1990: 45: Moench 1992: A172]. The effectiveness of regulations based on power tariff and supply policies is severely undermined not only by the availability of the diesel pumpset option but also by the presence of a 'kink' in the farmers' power demand.[2]

Although water markets are found to improve efficiency and equity in water use [Shah 1991; Saleth 1991b], they could, nevertheless, accentuate aquifer depletion under the current legal regimes governing access to ground water. Utilising the fact that the observed water markets are functioning in a legal vacuum caused by the absence of any legally defined property rights regime, Saleth (1993b, 1993c) has shown that water markets are: (i) extra-legal and inconsistent with any ethically grounded equity notions; (ii) instruments of rent-seeking behaviour contributing to widespread aquifer depletion; and (iii) transitional as rental markets for irrigation assets (i e, wells/pumpsets) emerge when water marketing ceases with the dissipation of the Ricardian rent due to intense competition among water sellers.

More importantly, in the case of surface water resources, neither the usual policies based on water charge and supply manipulations nor the new ones based on rotational water supply system[3] and farmer-managed outlet level co-operatives are likely to generate sufficiently effective impact to enforce discipline in canal water use. The absence of economic incentive among farmers to conserve water in canal commands has been already shown to be the culprit behind the ecological damages like waterlogging and soil and water salinity. It is now time for seeking harder options to provide a much more durable solution to our water-related problems rather than be content with the politically and administratively easy but practically ineffective regulatory policies followed thus far. One option is the institution and administration of a water rights system particularly for irrigation water.

III
Water Rights Issue in Literature and Policy

A brief review of the status of the issue of water rights system in current public policy and literature will facilitate not only a better appreciation of the institutional and policy implications of certain recent legal contributions but also of the nature and magnitude of the task of water law reform in India.

Although most irrigation acts in India, with their colonial roots, have ascertained and the post-independence legislations have implicitly presumed the absolute rights of the state over water resources, expert groups and policy-makers have, time and again, emphasised the need for something resembling a water rights system for regulating water use at the individual level. For instance, the Model Groundwater (Control and Regulation) Bill of 1970, formulated by the then union ministry of agriculture and irrigation and circulated among states for its possible enactment, postulated some kind of water permit system [GOI 1970].

The National Commission on Agriculture (NCA) went one step further by elaborating on the criteria for specifying the water rights as well as on the administrative system necessary for their enforcement [GOI 1976:23]. Undaunted by the fact that the 1970 model bill was not adopted by any state, the union ministry of water resources came out with another model bill in 1992 which is very similar in spirit to its predecessor [GOI 1992]. Though the bill lacks legal sanctity, it does indicate a change in policy-thinking.

While policy-makers have underlined the need for a water rights-centred water law reform, one finds an overall aversion towards the issue among economists who acknowledge its economic and equity significance but consider it an administrative nightmare and a political impossibility. Although, with the increasing weightage

attached to the sustainability implications of widespread occurrences of ground water depletion, sea water intrusion, land subsidence, and command area loss due to waterlogging and soil salinity, the opinion is gradually shifting towards making the water rights issue both administratively and politically acceptable, the Indian economic literature on water resources continues to neglect the issue.

Only a few writers have noted the need for water rights system, though mostly in a muted form and just as a passing reference. For instance, Dhawan (1975), who is among those who recognised the issue much earlier, has emphasised its need to correct the "ill-defined ownership arrangements" for countering ground water mining and the attendant external diseconomies. Shah and Raju (1988:A23) have alluded to the need for a reform in the structure of water rights so as to correct the existing skewed distribution in well and pumpset ownership. Impelled by the relative neglect of such an issue of critical significance, Saleth (1991a) undertook to emphasise its need and to show its technical/administrative feasibility and economic viability. Moench (1992:A175) has noted that without a water rights system specifying individual water withdrawals neither the water markets nor the user groups could function effectively.

Although the water rights question has been received much attention in the western legal literature, it has been treated only obliquely in Indian legal literature. An overview of the select Indian legal literature on water and allied issues as annotated by Siddiqui (1991) reveals that most works focus on the legal and allied issues related to irrigation acts or inter-state water disputes. But much more important than the issue of water sharing among states is the one related to the sharing and utilisation of water at the farm or household level since the latter has the ultimate impact on both efficiency and equity in water resource management and use. Unfortunately, one can hardly find any study that deals exclusively with the issue of water distribution or water rights at the inter-personal level.

For instance, although Jacob and Singh (1972) have addressed the issue of dispute settlement among irrigators and the role of panchayat institutions in dispute resolution, state's right in water supply has been their main concern. The legal aspects of ground water management and the nature of individual rights in ground water have been studied by Jain (1976). In a study focused on the linkages between law and poverty, Baxi (1987) deals with the question of group water rights in the context of untouchability.

There have also been a few proposals for reforming water laws in general and irrigation acts in particular. While Jacob and Mahesh (1976) argued for the unification and simplification of irrigation laws in India, Jacob (1977) has underlined the need to modernise Indian water laws to make them relevant to the new economic and social requirements. The reform proposal of Singh (1991) contemplates not just passing an act which is superimposed on the existing legal domain governing water resources but "a selective reconstruction of legal domain which pertains to acquisition, utilisation, distribution, protection, and conservation of water. It would require bringing together central and state laws, rules, orders, ordinances, customary laws, and court decisions pertaining to water. Such a selection will necessarily cut through constitutional, criminal, civil, and customary laws..." (p 14). He notes that even though our Constitution has provided a major charter for reform of laws, especially those colonial ones that violate the fundamental rights guaranteed in the Constitution and Directive Principles via Article 13, the government is yet to undertake the law reform. Hence, the task of purging out the colonial vestiges in the area of water and other natural resources laws has barely begun [Singh 1991:12-13] Contrary to what most irrigation acts passed both during and after the colonial period have presumed, Singh [1991: ch 2] establishes that water rights are essentially *natural negative claim* rights.

Water Rights Regime: An International Comparison

At the international level, we find a wide spectrum of water rights regimes ranging from the most centralised to a decentralised or privatised regime [Singh 1991, Devi 1991, Chauhan 1992a]. As countries move from a state of plenty to that of scarcity, they evince an increasing tendency towards centralised control of water.[4] The Spanish Water Law of 1981, the Ethiopian Law of 1981, and the Jordanian Water Authority Act of 1983 as well as the water laws in many South American countries like Peru and Colombia have all declared water as a state property. While the Chinese Water Law of 1988 contemplates a completely centralised water resource administration, both the Hungarian Water Law of 1964 and the Czech Water Act of 1973 allow independent local level decision-making while emphasising centralised control. The interesting aspect of Czech act is that it provides for the declaration of certain natural water accumulation as "protected areas" and certain natural water zones as "protected zones" with a view to conserve both water quantity and quality.[5] All the laws noted above require a water drawing permit or lease for all water uses excluding those for domestic and stocking purposes.

The British Water Act of 1989 as well as the US water laws go in the opposite direction of complete privatisation. In the US, at least four legal regimes governing water resources can be identified. While the riparian rights based on the common law doctrine are prevalent in the relatively water surplus eastern and pacific coastal states, the 'appropriative' rights based on the Colorado doctrine as well as rights emerging from the administratively issued water permits[6] are prevalent in the water-scarce western parts of the US. Under the Colorado doctrine, the person who appropriated the water *first* from a natural stream has a *prior* right (i e, prioritised right) to the extent of his original water appropriation and its beneficial use. Besides these legal regimes on surface water, one could also add the 'correlative' rights system being used for ground water allocation in most western states of the US. Under this system, farmers' rights are determined in proportion to their farm area [Burness and Quirk 1980:120 21].

What makes the US legal system unique is the fact that all these rights are transferable as they are considered property rights leading to the emergence of an expanding market for water rights [Saliba et al 1987]. However, even in the US, that upholds private property as sacrosanct, the idea of privatisation of water received a severe set back by the judgment of the California Supreme Court in 1987 which held that private property rights in water are not independent of environmental and public trust values. The court invoked a new principle of shared ownership based on the 'public trust' doctrine, the historical origin of which is traced to *Manusmriti* and *Arthasastra* [Singh 1991:49-50].

India, like the US and UK, has separate laws for surface water and ground water. On the other hand, countries like Spain, Hungary and China treat water from both sources alike in their legislations. In the case of Czechoslovakia, Hungary and France, the idea of integration goes a step further as their water laws incorporate the land resource management issues as well. In India, while surface water is largely under centralised control, ground water, legally belonging to the community at large, is subject to the *de facto* private control of farmers and other users. Group/community rights are also recognised in the case of many small streams and tanks. The legal system related to water in India, representing a complex amalgam of customary laws, colonial legislations, and modern post-independence laws, is more comparable to that of most African nations, like Nigeria, than to that of the US [Singh 1991].

IV
Economic Dimensions of Water Rights System

In addition to the legal issues and requirements reviewed so far, there are certain critical economic requirements that a water law regime should satisfy. For, in the ultimate analysis, it is the economic compulsions which are going to move the decision-makers

and it is the economic benefit criterion that is going to guarantee an efficient and equitable water law. Therefore there is an immediate need to venture also into the political economy of water law and establish clearly the social benefits from instituting a water rights system, as well as to identify feasible institutional mechanisms necessary to make the system perform its fundamental economic role, i e, the provision of economic incentives for water conservation. This leads to the next issue, namely, what are the vital economic requirements that the water rights system should satisfy apart from its legal characteristics? In order for the water rights system to perform its economic function, the water rights should necessarily satisfy two interrelated requirements. First, water rights should be defined on a private basis. And, second, they should be transferable or, at least, amenable to a rental system.

Private Rights within a Public Trust Framework

Privatised water rights are very critical from an economic point of view. Transferability of rights and the resultant price mechanism cannot be obtained without establishing first some form of private user rights, if not property rights, in the resource under consideration. For, what is not owned cannot be priced as prices are just the payments for property rights or, more specifically, for the rights to use an asset [Dales 1968:792].

If the rights of the states or nations in sharing trans-boundary water resources can be established [Chauhan 1992b], why cannot similar rights at the individual user level be established especially given the fact that the legal principles are independent of any change in the legal persons involved. Although the ontological status of water makes the rights in water a legal fiction and allows only *de facto* user rights [Singh 1992:27], *de facto* rights are economically more relevant than the *de jure* rights as transferability becomes economically more important at the level of water utilisation than at the level of its ownership.

What is the legal framework within which a private water rights system should be instituted? From the perspective of economic utilisation of water, it is not enough to establish people's usufructuary rights and the state's rights as a trustee. It is incumbent on us to go a step further in deciding how the people's right should be distributed further among the peoples on an individual basis. Singh (1991:59) has argued that neither a complete state (or community) ownership nor a complete private ownership is going to provide a lasting solution implying thereby the need for a judicious combination of the two ownership systems. Such a combination can be achieved under the public trust framework where the state or community has a control over water resources as a trustee and people have the usufructuary rights.

When a suitable water rights structure is designed under the public trust framework to demarcate the specific rights of the state, the community and the individual users, the kind of private rights system outlined in the previous section and the communal ownership system suggested by Devi (1991:624) need not be inconsistent but could be accommodated. As a matter of fact, the public trust framework with a dovetailed water rights structure represents a synthesis of a completely centralised system and a completely privatised system of water rights. It can also be argued that the water rights arrangement outlined above also fits eminently with the requirements of sustainability. For, state/community ownership allows social control over the amount of and the manner in which water is utilised and distributed ensuring thereby both ecological security and social equity in water use. On the other hand, private user rights allowing transferability promote economic efficiency in water use.

Private Water Rights and Income Distribution

Although the precise nature of the ownership pattern is immaterial for economic efficiency as long as the water rights are private and transferable, it does have fundamental equity implications as the issue of who has the user rights in the resource determines actually to whom the benefits of such a transfer and, hence, water utilisation, should go. Obviously, the community as a trustee cannot appropriate the benefits for itself but only to distribute them among its members through some non-market mechanisms which cannot be immune to defects and criticisms. While a transferable private water rights system can effectively apportion the benefits among the people within the exchange process itself, the community rights system cannot tackle the critical problems of inter-personal water allocation and benefits distribution without resorting to an extra-market distribution mechanisms such as a tax-subsidy system.

Private Water Rights and Accountability

The implications that the nature of water rights postulated has for accountability warrant a still harder look going beyond the strict legal conception of accountability. For instance, when water rights are defined only at the community level, as suggested by Devi [1991:624], it is possible to ensure only the accountability of the community to the state and to the people. But the issue of inter-personal accountability, a critical component in the two-way accountability notion suggested by Singh [1992:8] cannot be always ensured under the community-centred rights system. To ensure accountability of the individuals to each other and to the community, it is essential, therefore, to specify water rights at the individual level as well

Immediately related to the accountability implications of private rights system are the economic implications emanating from the linkage between the legal notion of accountability and the economic concept of externality.[7] In the case of water, such externalities are a common feature since, for instance, water use by an individual can affect both the quantity and quality of water available for others. When law defines individual water rights, it defines, in effect, not only the legal boundaries but also the physical and economic boundaries of each individual's acts and their effects on others in the context of water use. By relating rights with duties, such boundaries could be legally handled with reasonable quantification. Consequently, individual water rights system helps not only to minimise inter-personal conflicts but also to achieve the legally grounded notion of the two-way accountability. Since accountability as a mechanism for minimising externalities is crucial both from economic and ecological viewpoints, it is important to have an individual water rights system.

Economic Significance of Transferable Rights

Another fundamental economic requirement for water rights is that it should be transferable or, at least, rentable in the sense that water rights can be rented in/out either in part or in full for a shorter or longer duration. Without such a transferability or rental possibility legally imparted into the rights system, it is not possible to achieve social optimality in water use, i e, where the benefits from water are equalised at the margin across all uses and users. Transferability and exchangeability of water rights are crucial to capture and reflect the scarcity or use value of water through price signal and guide water allocation accordingly.

The question of transferability of water rights remains somewhat ambiguous in the legal literature. The assertion of water rights as natural or fundamental negative rights [Singh 1992:27] appears to be intended essentially to repudiate state's absolute rights in water and re-establish people's rights over this vital resource. But, since negative rights cannot be ownership or property rights [Singh 1991:26], it is not possible to establish legal ownership rights in water. While negative nature of rights negate ownership rights and, hence, transferability, the transferability of usufructuary water rights is admitted in another context. For instance, although water belongs to the people and not to the state, the government can have natural usufructuary right *with the consent of and compensation to the concerned people* [Singh 1992:29]. That is, water can be transferred from two legal persons, the people and the state. While one could agree that water for drinking and domestic use can qualify to be a fundamental human right, water for other economic uses need not have the same ethical qualification. Therefore, the legal conception of water rights should be such as to permit ownership rights and hence, transferability between legal persons like individuals, groups, and the state itself. Otherwise, water rights will remain basically a legal curiosity bereft of any economic significance whatsoever.

Transferability and Optimum Utilisation

There are a number of distribution principles considered relevant for water rights allocation.[8] The most important among them is the equitable utilisation principle under which individual water rights are established either through an adjudicator or through bilateral negotiation so as to optimise or maximise the utilisation of the resource. To show that transferability is indispensable for ensuring optimum water utilisation, let us visualise the operation of the equitable utilisation principle (or any other distribution principle for that matter) as a two-stage process. At the first stage, water rights of the individuals are distributed either through adjudication or through mutual agreement to establish the initial water endowment of individuals (or any other legal entities). And, at the second stage, the amount of water specified in the rights is used to obtain its optimum utilisation

The notion of 'optimum' cannot be identified without taking a recourse to economic principles which will naturally require us to consider notions like values and prices. Insofar as the value of water differs across individuals, an optimum utilisation of the resource at a societal perspective cannot be achieved unless we allow water transfers at the second stage to equalise water values across individuals. Moreover, when the principle allows bilateral negotiations in the first stage of water rights distribution, why should it exclude the same in the next stage of water utilisation? The above arguments lead to the fact that transferability of rights which is indispensable for realising the major aim of the equitable utilisation principle is both technically and legally feasible.

It is also possible to show that transferability of water rights is also necessary under the pani panchayat system. The equal sharing principle underlying the pani panchayat system allows water even for the landless persons. If water rights are not made transferable, then the water distributed to the landless persons will not be of any economic significance either to themselves or to the society at large. Therefore to promote economic equity rather than physical equity *per se* in water sharing under the pani panchayat system, water rights of individuals need to be transferable. This requires that water rights be made private or user rights.

Land and Water: Legal and Economic Linkages

A point immediately connected to the issue of optimum water utilisation is the specific set of legal and economic relationships postulated between water and land. We do agree that there should be a legal separation between land and water in order to enable even those without land to have an access to water. Else, water allocation will further reinforce the already existing land inequality with water inequality giving rise to the phenomenon of 'land-waterlordism'. But, such a separation should end up at the stage of water rights distribution. At the utilisation stage, neither the legal separation nor the non-transferability issues should be allowed to undermine the innate economic linkages between land and water. Otherwise, it will not be possible to ensure efficient utilisation of both land and water resources.

We reckon that private water rights system is very crucial for promoting sustainable management of water resources. For instance, while the ecological and equity requirements of sustainability could be taken into account at the stage of water rights distribution by determining the total quantum of water and its distribution among the claimants, economic efficiency in water use can be ensured by allowing transferability at the stage of water utilisation. Therefore, the legal attributes of water rights, i e, private ownership and transferability, are pivotal for achieving sustainability of water resources.

Towards a Water Institution

Water institution is concerned with three inter-related aspects, i e, water policy, water law, and water administration. Our ultimate goal is to move from a mere water policy to water institution via water legislations. Fortunately, we do have a National Water Policy (NWP) in place right now. Despite its limitations, the NWP of 1987 does recognise the need for some upper limit on individual water withdrawals and use. But, the NWP has identified neither the mechanism by which such a limit will be established nor the institutions through which its three major planks, i e, conjunctive use, supplemental irrigation, and water-saving technology and crop pattern, will be achieved. It is too naive to believe that these three goals could be realised through the usual credit and subsidy-, based mechanisms identified in the NWP.

Although the model bill of 1992 suggests a rudimentary form of water permit system particularly with an added proviso to alter the conditions of the permit including the amount of allowable water withdrawal, it has also failed to explicitly incorporate specific legal and institutional mechanisms to enforce quantitative restrictions on water withdrawal.

While the model bill does signify that we are moving marginally towards a water law, there is still a long way to go before realising a veritable legal regime to establish private and transferable water rights system within the 'public trust' framework.

Such a hierarchically arranged water rights structure could alone provide the economic and social incentives necessary to achieve not only the specific goals of the NWP but also the much broader goals of sustainability in the context of water resources. However, current legal and institutional gaps should not deter us to look still ahead and explore potential institutional mechanisms and the *modus operandi* of a desirable, and also a technically and administratively feasible water institution capable of meeting the challenges of sustainability.

While the tremendous net social benefit possible from a water rights system is very obvious, we should be realistic and pragmatic enough to appraise whether do we have the technical and institutional potentials and capabilities to establish, enforce, and administer a sustainability-oriented water institution. At the outset, let us first dispel the commonly held belief that the absence of corporeal quality for and the fugitive character of water presents an insurmountable technical obstacle for defining a water rights system in a physical sense.

Complete physical control over an object is not at all necessary for establishing an ownership system. For, ownership to an asset implies only a bundle of circumscribed user rights. That is, it is rights never objects that are owned [Coase 1960:44; Dales 1968:792] and such rights are not free from correlated duties and social control. It is the mistaken perception of an asset as a physical entity rather than as a legal entity just implying a bundle of user rights (of course, with correlated duties) that militates against the technical feasibility of defining water rights in a legal context. However, it is better to keep in mind that the peculiar physical characteristics of water, especially its fluid nature, require somewhat different treatment as compared to solid and semi-solid resources such as land or forest [Singh 1992.28].

Water Rights System: Technical Requirements

The most important and immediate technical requirement for a water rights system is to establish water balance, i e, the demand for and supply of water, for each appropriately defined hydro-geological unit. In order to facilitate a better decision-making under uncertainties, it is also desirable to establish water balances under a variety of alternative climatic and technical condition. It is also crucial to disaggregate the demand by uses and supply by sources so as to establish the quantum of water from various sources that would be available for meeting irrigation requirements. Moreover, uneven distribution of water demand and supply across regions requires the formation of 'water grids'—each representing a fairly uniform agro-climatic and hydro-geological unit—that could also provide a necessary structure to promote inter-basin water transfers suggested by the NWP. This calls for both economic and hydro-geological studies.

While economic studies of the kind required in this respect are yet to emerge, the technical and institutional potential for ensuring sufficient progress in the hydro-geological field to establish basin and sub-basin-wise water balance estimates is promising. A network of about 5200 hydrograph stations spread throughout the country is currently involved in collecting and updating information on climate and precipitation, ground water pumping, and aquifer recharge [Pathak 1988:87]. This information forms the basis for the model ground water balance studies for selected areas being undertaken by the Central Groundwater Board in collaboration with the National Institute of Hydrology so as to identify the quantum of water that can be safely withdrawn in the respective study regions [GOI 1988.109].

Our capacity to obtain still accurate information about the geological and hydrological characteristics of ground water aquifers is likely to be strengthened further by the continuous progress both in the geo-hydrological technologies like electric drilling and isotopes as well as satellite and computer technologies [Cano 1983:20-21]. However, we do not fail to recognise the serious gap persisting in the current water balance studies, i e, the economic aspects of water requirements and supply, which is critical for determining the amount of water available for distribution across uses and users. This gap should be filled so that the water balance studies could provide a strong hydrological and economic information base indispensable for establishing a sustainability-oriented water rights system.

As to the *modus operandi* of the rights systems, three issues qualify for our immediate attention. They are: the unit of measurement to be used, the need for suitable criteria for rights distribution, and the mechanisms to be designed for the enforcement and monitoring of the established water rights system. An ideal unit of measurement will be the one that is independent of time and other spatial

considerations. That is, it implies the same amount of water across time and space. This demands a volumetric measure rather than a flow-based measure. Let us also note that the suggestion of a volume-based measure is nothing new as it has been suggested long before by the National Irrigation Commission in 1972 and has also been subsequently endorsed by the NCA in 1974. It is the volumetric measure that could provide the much-needed economic incentive not only for maximising output per unit of water instead of the usual practice of maximising water per unit of output but also for providing strong economic and social incentives for the adoption of water-saving technologies, crop pattern and farm practices. The availability of water measuring technologies like the water meter makes the volume-based measure a technical possibility. It can be noted in this context that the model bill of 1992 suggests the mandatory installation of water meters by all the ground water permit holders including the farmers [GOI 1992:8].

Regarding the criteria for water rights distribution, we note that insofar as water rights are private and transferable or amenable to a rental system, economic efficiency is independent of the criteria used since the final allocation of water is independent of the pattern of initial distribution of water rights. This fact emerges from the familiar result of Coase (1960) that allocational efficiency in a private exchange economy is independent of the property rights system. However, from an equity or income distribution point of view, the choice of the criteria to be used for distributing water rights is a matter of utmost importance because water rights amount to asset transfers. While one can think of a variety of approaches including a bidding procedure for rights allocation, here we consider just two familiar criteria.

The criterion underlying the correlative rights system suggested by the NCA for ground water distribution is land ownership. Under the system, the available ground water in a basin, after having allowed for non-agricultural needs, will pertain to land and each holding weighted in terms of its soil quality and its access to surface water will have a legitimate right to a proportionate share of the ground water [GOI 1976:23]. Although this model relating water to landholding is appealing from water utilisation point of view, it has the deleterious effect of accentuating rural inequality by combining water ownership with landownership as has been noted already.

The Pani Panchayat model provides an alternative criterion by which all persons irrespective of their landownership status get an equal share of water. We recognise the fact that when everyone owns land and farm sizes are equal, both the NCA and Pani Panchayat models will yield the same pattern of water rights distribution. From an extreme viewpoint, one can also argue for a water rights distribution which is in a reverse order of land ownership in order to counter the existing inequality in land ownership. Neither pretending to have the final answer nor ignoring the possibility of a host of more sophisticated approaches to this tricky issue, we can suggest a hybrid model where certain amount of water which is reserved for landless persons is apportioned in accordance with the Pani Panchayat model and the remaining is distributed among landowners in accordance with the NCA model.

Another model that can also be considered in this respect is the one in which the total water available for irrigation purpose is first theoretically distributed across the landowners via the NCA model and then, as a kind of progressive tax, the water rights distributed among the individuals in the first stage are proportionately reduced to form a pool for its subsequent distribution among the landless. They could augment their income by selling/renting their rights.

Enforcement and Monitoring Mechanisms

While the government, as a grand trustee of the water resources, has the responsibility to establish an equitable water rights system, the enforcement and administration of the established rights system should be left to the local trustees who can be either panchayats or other village-level or outlet-level groups. The usufructuary rights vest with the individual users. Such a decentralised mechanism will be the effective means of enlisting people's participation in water management as the water rights system has now created a stake for their involvement.

Irrigation co-operatives of various forms are not new to India [Datye and Patil 1987]. The major reason for the poor economic and organisational performance of these co-operatives is that in the absence of a water rights system to categorically specify individual claims, the economic and socio-political configurations tend to determine actual water use causing internal conflicts and tensions. Within the context of a water rights system, such co-operatives could certainly perform better than at present. This applies equally to the outlet-level user associations being experimented and promoted in the canal commands of various states [Rankachari et al 1992; Jayaraman 1981]. Despite their weakness, the existing irrigation co-operatives and outlet-level user associations do indicate the existence of a fair amount of institutional potential at the grass roots level that could be tapped to develop effective and flexible mechanisms for the enforcement and administration of water rights system.

Given our farmers' familiarity with the turn-based canal water allocation under the warabandi and rotational water supply systems, the NCA has suggested a farmer-managed warabandi-type system even for ground water withdrawal. Notably, such a rotation-based system, if adopted within the framework of a water rights system, could avoid the peak-load problem emerging from the simultaneous ground water pumping by innumerable farmers which is the major culprit for the continuous recession in ground water tables. Since the rotation-based ground water withdrawal allows sufficient time for the aquifer to recharge, ground water depletion can be greatly minimised. We also add that to infuse some flexibility in the system, farmers could be allowed to exchange their turns through mutual agreement or even on a payment basis.

Framework for Water Rights Structure

The 'public trust' framework essential for hierarchically structuring the water rights of the state/community and the ultimate users has been already discussed. Such a framework, besides being an institutional synthesis of centralised and decentralised decision-making mechanisms, has also other desirable integration properties. Among them, the following feature is very critical both from a legal and economic perspective.

While the right of the state or community is essentially a legal one related more to its duties in establishing water allocation and its priority, the individuals' *de facto* rights are not only legal but also physical in nature in the sense that these user rights specifies a fixed quantity of water along with other legal rights and duties attached in its utilisation. Thus, the water rights structure within the 'public trust' framework enables us to integrate both the legal and physical notions of water rights. Although ensuring such a physical notion is difficult in the case of water in view of its fluid nature, yet, it is this physical notion which is very important from an economic point of water use.

The hierarchically structured water rights system under the 'public trust' framework could ensure internal legal consistency and also satisfy the basic economic requirement. But, in order to achieve technical and physical consistency within and between various use categories of water, it is vital that the water rights structure itself should be designed within a broader operational framework. Although the basic features of the legal framework remain the same across the regions (basin, villages, etc), the physical form of the water rights structure naturally varies across regions or decision-making context to account for the variation in their water endowments and requirements.

An important issue requiring our attention in the context of water rights institution is how to handle the relationship between various kinds of rights in water and water-based resources and also in their use categories. From an analytical point of view, although rights in and water and water-based resources can be considered separately, they

are interrelated operationally. How could the water rights system handle, say, a conflict between the water needs for irrigation and power generation or navigation? While an effective inter and intra-sectoral prioritisation scheme could help to minimise conflicts, law remain helpless to provide the solution to this ticklish issue without economic and technical information such as water availability and its distribution by sources and regions.

By assuming a decentralised decision-making structure endowed with sufficient economic and technical information, it is possible to visualise the following hierarchically arranged water rights structure. First, the quantity of water and its priority for different sectors are established at a given geographical and decision-making context (e g, river basin and village) preferably on an annual basis to enable periodic revision. Second, within the sectoral allocation pattern established above, the water amount and its priority for uses within each sector are established. And, finally, having sorted the water allocation across communities, the amount of water available to each individual members (i e, individual water rights) of the community is determined based on the criteria discussed in the earlier section.

The legal framework of water law has to be designed within the above framework to achieve internal consistency between the water rights of various sectors and uses. We cannot be naive to ignore the tremendous amount of information required, financial and administrative problems to be solved, and political conflicts to be resolved for designing and implementing such a scheme within the legal framework of a water law.

It can be seen that private water rights and community water rights could be accommodated within the 'public trust' arrangement where the state or community has a ownership right enabling it to have social control so as to promote ecological security and social equity while individual members have private and transferable user rights so as to promote economic efficiency in water use. Similarly, physical and technical consistency within and between various water use categories can be ensured by designing the 'public trust' arrangement itself within a broader framework noted above. Such a hierarchically defined and dovetailed water rights structure is, in fact, the most ideal arrangement for both accountability, equity, and sustainability under current institutional and technological conditions.

VI
Water Rights System: Potential and Prospects

Despite the absence of any declared water law specifying a water rights system of the people, one can find evidence for the operation of rudimentary systems capable of being developed into an effective water rights system. Informal water rights—both individual and group—have existed in India since the ancient times [Siddiqui 1992] and continues even today, albeit in a much weaker form, in many tank irrigation systems of south India [Vani 1992]. In the case of few south Indian irrigation systems, Vaidyanathan (1985:63-64) has pointed out the existence of an informal prioritised water rights system where the rights are not for individuals but for different distributaries/segments of the command area.

The 200-year old 'phad' system operating in the Panjhra River area of the Dhule district and the Pani Panchayat system operating in the Mula command of Ahmednagar district, Maharashtra [Datye and Patil 1987:42-123] have the potential for creating a farmer-managed water rights system. In the deltaic regions of Orissa and West Bengal as well as in parts of Bihar and Madhya Pradesh, there are evidence for the existence of an officially granted non-transferable long-term water lease system to induce farmers to use surface water [GOI 1976.65].

More important and interesting of all is the 'shejpali' (water distribution roster) system being practised in the canal commands of western Maharashtra. Under this system, the canal authorities issue 'water passes' on the basis of an application from farmers in the command on a 'first-come first-serve' basis. The duration of these water passes varies from six year (or sometimes more) to an year and even for a single crop season and there is a priority hierarchy among the passes that varies somewhat directly with their duration [Gandhi 1981; Rath and Mitra 1989]. But for the non-transferability and quantitative specification of water rights, the water pass system resembles very closely the water permit system being practised in the mid-western parts of the US.

Although we are far away from it as yet, water rights system can no more be considered as an utopian dream. Much economic research is urgently needed to instigate/generate serious political and policy debate in India over the possibility of instituting a water rights system through a radical water law reform. The present status of inequitable access to water and ecological consequences engendered by aquifer depletion and surface water misuse casting a shadow over the very survival of our agriculture is a potent reminder for change.

The desirable practices like conjunctive use, supplemental irrigation, water-saving technologies, water transfers, and water recycling cannot all happen in an economic vacuum. They need a strong economic incentive that could emerge only when an individual farmer perceives a water constraint which, in turn, can occur only with a kind of water rights system studied here. It is not time to enumerate the administrative difficulties, technical snags, or political problems but to identify ways and means by which these problems could be managed to make an efficient and practical water rights system as an one of the indispensable institution for promoting sustainable development.

At least, a part of the research money and effort currently allocated to the study of defective or ineffective institutions like water markets or the regulatory regimes based on well siting and licensing norms, electricity tariff and supply manipulations, etc, should rather be invested both in exploratory studies on the various aspects of a water rights system as well as pilot schemes to experiment and field-test different water rights models. It is well to remember that even an imperfect water rights system can provide a more long lasting solution than perfectly devised ineffective regulations.

VII
Concluding Remarks

The legal case for a water law reform both to purge out the lingering colonial vestiges in the realm of water laws as well as to make them relevant to current and future socio-economic requirements of the country is inescapable. The economic rationality and urgency for a water institution based on a water rights system on the lines argued in this paper are indeed very obvious. The institutional significance of the water rights system for sustainable development emerges from the fact that it is one of those rare policy instruments that can simultaneously address three critical goals of sustainable development, i e, ecological security, economic efficiency, and social equity. Moreover, since water rights systems especially the one based on the 'public trust' framework allow social control and decision-making at the stage of allocation of rights and decentralised private decision-making at the stage of water utilisation, it provides an eminent instance for the kind of institutional synthesis necessary for sustainable development. Our hydro-geological information base and technical skills which are bound to further enhance our capability especially with technological progress could certainly support a water rights system. The existence of various forms of incipient systems of rudimentary water rights in different parts of the country and the ability and maturity of our farmers to manage water allocation by themselves as revealed by the spontaneous emergence of ground water selling activities and the growth of farmer-managed irrigation systems do indicate that our farmers could

very well adapt themselves to the institution of water rights.

The ultimate significance of a water rights system emerges from the following simple arithmetics of costs and benefits. Even if it could succeed in effecting just a 10 per cent improvement in water use efficiency, i e, instead of the officially assumed average water application rate of 0.67 hectare metre (ham), an application rate of 0.60 ham, we could add an additional 14 million hectare of irrigation potential even under the current level of water utilisation. Surprisingly, the additional irrigation potential emerging from water use efficiency is very close to what we have achieved in the Seventh Plan with so much of investment of money and time. In simple terms, it can be established that the ecological, economic, and equity benefits possible with the water rights system could very well surpass the costs of instituting it.

Notes

[The author is very grateful to B D Dhawan for his encouragement and valuable suggestions.]

1 Market failure normally occurs when an exchange between two or more individuals fails to be consummated either due to an undefined property rights in or absence/inadequacy of relevant information on the commodity being exchanges.

2 The presence of this kink emerging from an interplay of power supply, ground water conditions, and agronomic and economic factors makes the power consumption insensitive to tariff changes insofar as the tariff rates are fixed below the marginal value productivity of an unit of power. As a result, tariff-based regulatory mechanism become ineffective to control ground water depletion [Saleth 1993a].

3 This system is not as new as it is claimed. For instance, Vaidyanathan (1985, p 73) notes its introduction in north India in the late 19th century with full legislative and administrative support.

4 This trend appears to confirm the Wittfogel's theory that asserts the inherent tendency of hydraulic societies to become centralised, despotic states. A critical comment on this thesis is given in Vaidyanathan (1985).

5 In the immediate aftermath of the 1979 drought, a somewhat similar idea was mooted in India by the Union Ministry of Agriculture to establish 'ground water sanctuaries' where ground water will be extracted only during very dry years when other sources of water get completely exhausted [Swaminathan 1982, p 88].

6 Although these permits are issued by the state administration, they enjoy legal sanction as the courts tend to uphold these administratively issued permits [Ciriacy-Wantrup 1956, p 306].

7 Externality emerges when the outcome (e g, utility, output, etc) to a person or a group of persons is influenced not only by that person's or group's decisions but also by those of others. Such an influence can be either positive or negative.

8 For a brief discussion of these distribution principles, see Singh (1991, ch 6).

INDIAN ORGANIC CHEMICALS LIMITED

REGISTERED OFFICE Bhupati Chambers, 4th Floor, 13 Mathew Road, Bombay 400 004

The Speech delivered by Mr. S. B. Ghia, Chairman, Indian Organic Chemicals Limited, at the 34th Annual General Meeting held in Bombay on 7th September 1994.

Mr. S. B. Ghia
Chairman

Ladies and Gentlemen

I welcome you to the 34th Annual General Meeting of our Company The Directors Report and the Audited Accounts for the year ended 31st March 1994 have been with you for sometime and with your permission I shall take them as read

ECONOMIC AND INDUSTRIAL SCENE

The National Economy is in a much better shape now thanks to the reforms carried out during the last three years The agricultural sector has registered a high rate of growth and the industrial sector which has come out of recession is also firmly on the path of recovery A quantum jump in exports and inflow of foreign capital through foreign institutional investors euro issues and direct foreign investment has made the country s foreign exchange position very comfortable With burgeoning foreign exchange reserves at nearly $ 18 billion the issue now has become one of management and utilisation of these reserves

The future augurs well for the Indian Industry India is now being perceived internationally as a land of opportunities and the signing of the GATT agreement will further integrate us with the world economy

OPERATING RESULTS FOR 1993/94

The operating results of the Company for the year under review have been better than in the previous year The company will be back on the dividend list on your approving the recommended dividend of 12%

CHEMICALS DIVISION

As you would have observed from the Director s Report increase in the prices of alcohol and its non availability in sufficient quantities affected the working of this Division The alcohol situation all over the country has not been very encouraging ever since its decontrol in June 1993 Maharashtra has not been an exception The prices of molasses and alcohol have risen sharply since then The situation will further aggravate with the latest announcement of Government of Maharashtra permitting export of alcohol I hope that the situation will redress itself to some extent after commencement of the new crushing season in October/November this year since the ensuing sugarcane crop is expected to be very good The improved availability of alcohol will enable us to increase production and sale of our alcohol based chemicals

We have taken various steps for improving the working of this Division which inter alia include emphasis on agricultural activities and efficient capacity utilisation of Ethyl Acetate Acetic Anhydride and Glyoxal plants Further there is an upward trend in the prices of alcohol based chemicals particularly acetic acid in the international market which will also be a contributory factor in improving the profitability of the Division

I am happy to inform you that the trial runs of Phenylglycine Base have commenced successfully with the product being found to be of international standards This should usher a new era for our Chemicals Division The Phenylglycine plant set up by our technical team with very limited foreign technology is a very versatile plant We will be manufacturing in stages various other Phenylglycine derivatives in the said plant

FUTURA" SYNTHETICS DIVISION

At long last polyester fibre is finally finding its rightful place among the raw materials for textiles in India and its demand is likely to be strong in the current year The Government s thrust on exports of textiles has caused a boom situation for cotton based exports with polyester based fabrics meeting the requirements of the domestic market The current estimates are that the local demand for polyester fibre will exceed 500 000 tonnes by the end of this century if not earlier We are gearing ourselves to cater to this growing demand and propose to maximise our production with a major thrust on manufacture of value added specialty fibres We are also intensifying our export efforts

To strengthen our capabilities in the manufacture of specialty fibre we propose to set up a joint venture company with a reputed European producer of master batch chips which are required in the manufacture of coloured fibres A part of the production from the new plant is proposed to be supplied to your Company for its captive consumption

At a time when polyester fibre consumption is increasing it is a matter of grave concern that its inputs viz DMT/PTA have become scarce worldwide In the last one year large capacities have been set up all over the world for manufacture of PET Bottle grade Resin which has caused PTA to be diverted to this sector This problem is more grim than it looks This is due to the fact that the main raw material for DMT/PTA i e Paraxylene is itself in short supply and even if decisions for production capacities are taken today they will not yield output for at least 2 3 years All this has resulted and will continue to cause an escalation in prices of polyester fibre and its raw materials

Looking to all these developments your Company s decision of supplementing use of DMT/PTA with use of alternate raw materials has served the Company eminently This strategy will be continued in greater measure in the years to come and will help your Company not only to cut costs but also to act as a buffer against wide fluctuations in the availability of conventional raw materials

SONATA SOFTWARE DIVISION

The computer software industry has emerged as the fastest growing sector in the Indian Economy with very good demand both in the domestic and overseas markets A necessary feature of the industry in recent years is an increasing emphasis on foreign tie ups and collaborations particularly for access to export markets In order to take full advantage of these trends which "Sonata" cannot presently derive as a Division of your Company it is proposed to spin off the activities of this Division to a new Company which will be a subsidiary of your Company Your approval is therefore being sought for transferring the entire assets and liabilities of this Division at their book values to a new company with effect from such date as may be decided by your Board of Directors The Company's investment in the Division as on the date of transfer will be partly treated as the Company s share in the share capital of the new company and partly as loan to the new company on such terms and conditions as may be decided by your Board I am confident that you will approve the said proposal which is in the best interests of your Company

RESTRUCTURING OF YOUR COMPANY'S OPERATIONS

With the advent of liberalisation and consequent intense market competition we have reviewed our activities and identified our core areas of competence I have already spoken about our strategy for polyester fibre In addition your directors have also taken a strategic decision to concentrate all energies in the manufacture of polyester fibre and withdraw from the polyester filament yarn business in which our capacity is relatively small and we do not have any significant advantages over our competitors

As you would have observed from the financial results of the year the excess polycondensation capacity that we had at Manali Madras has been transferred to a new joint venture with Pepsi Cola International of USA Out of the sale proceeds of Rs 30 crores from the polycondensation unit Rs 19 crores has been re invested in the capital of the new company and out of the balance a major portion has been utilised for reduction of our debt The proceeds from the sale of polyester filament yarn plant when received in the financial year 1995/96 will similarly be utilised to very large extent in paying off our debts Discontinuance of POY business will also help us in reducing our working capital requirements substantially

With the aforesaid measures our long term debt burden which was Rs 93 crores in 1992/93 has been brought down to Rs 79 crores in 1993/94 and we hope to bring it further down to Rs 58 crores in 1994/95 On the other hand the net worth which was Rs 60 crores in 1992/93 has increased to Rs 110 crores in 1993/94 and we hope to increase it further in 1994/95

The Debt Equity ratio which was 1 63 1 in March 1993 is 0 72 1 in March 1994 and will further stand reduced at the end of the current financial year

You would have observed that our Chemicals and Software Divisions have received ISO 9000 accreditation The "Futura Synthetics Division will also get the said certification in the current financial year ISO 9000 certification implies a change in mental attitudes a global marketing and selling culture technological adeptness shop floor efficiency inventory control process control etc We are now fully geared to face competition both at the national and international level

I trust that the various steps taken by us will make the current year and the future brighter than the year under review I therefore look forward to a promising future for your Company

ACKNOWLEDGEMENTS

In conclusion I would like to sincerely thank my colleagues on the Board for their wise counsel and support and to our employees for the devoted manner in which they worked I also wish to express our thanks to the Central Government and State Governments of Maharashtra Tamil Nadu and Karnataka Financial Institutions and the Company s Bankers for their continued support and assistance Last but not the least I would like to thank our shareholders for their invaluable support and confidence in the Company

Thank you

S B GHIA
CHAIRMAN

(This does not purport to be a report of the proceedings of the Annual General Meeting)

Tamil Self-Determination in Sri Lanka

Challenges and Prospects

Sumantra Bose

The idea of Eelam has taken firm roots in the Tamil consciousness. What might yet convince the alienated Tamil population that they have a future within an united Sri Lanka is the reconstitution of Sri Lanka as a highly decentralised multinational state of Sinhalese, Tamils and possibly, Muslims which would entail major institutional restructuring of the state.

A SINHALESE prime minister speaks of rebuilding Sri Lanka as "a country where people can live without fear, a vibrant living democracy of new systems and new institutions." On her new approach to the Tamil question, an aide reveals that Chandrika Kumaratunga was "deeply influenced by her student days at the Sorbonne in the 1960s, where she studied the history of France's colonial war in Algeria and learned the futility of confronting a popular liberation struggle with force". In an unusually effusive response, the Liberation Tigers of Tamil Eelam's (LTTE) international secretariat in London declares that the Tigers would be "very, very willing and pleased to talk to Chandrika and have a negotiated settlement". Days later, the movement's ideologue, Anton Balasingham, confirms this position from Jaffna; significantly, his remarks are given wide publicity in the (LTTE-controlled) Jaffna press. Travellers to the south from LTTE-held territory report seeing Tiger posters announcing readiness for a ceasefire. Finally, Velupillai Prabhakaran, in a rare public statement, reiterates willingness to engage in unconditional dialogue.

After South Africa, Palestine, and now Ireland, is it finally Sri Lanka's turn for peace?

There is a definite basis for cautious and qualified optimism in the recent political developments and that itself is a historic occurrence by Sri Lankan standards. It is well to remember that had the United National Party (UNP) been returned to power, Sri Lanka would probably be making news today for an entirely different reason: the futile bloodbath caused by a government offensive against the north. Peace is finally visible on the horizon, but much remains to be done if its appearance is not to go down in history as a mirage. A glimmer of hope has finally appeared at the end of a very long and dark tunnel, yet that tunnel will still have to be traversed before the hope is actualised as reality. Very formidable obstacles remain to a just and lasting peace, as quickly revealed by the fact that Kumaratunga was only able to effect a partial lifting of the cruel and counter-productive economic blockade against the north. The Tigers' response, the release of a mere 10 prisoners of war, was equally and calculatedly partial; a total dismantling of the embargo would probably have led to the freeing of a far more sizeable number (perhaps almost all) of Sinhalese POWs in Tiger custody.

What measures and decisions need to be taken to permanently end the civil war and what are the major problems and challenges that must be overcome in the process? The fundamental fact to recognise is that the conflict can only be resolved, short of secession and the formation of an independent Tamil entity, by a radical and comprehensive restructuring and reconstitution of the Sri Lankan state. Attempts to substitute such a far-reaching systemic transformation with cosmetic changes or superficial reforms will not only not work, but will be a waste of time for all concerned.

What might this mean in practical terms? The four-point Tamil charter of self-determination, issued at Thimphu in 1985, demanded that Sri Lankan Tamils be recognised as a distinct nationality; that the north and east be recognised as the historical homeland of that nationality; and that the Tamils' right to self-determination (left deliberately undefined and implicitly, open to negotiation) be acknowledged. For the very first time, we have a top Sinhalese leader, in office, with the will and vision to not dismiss this charter out of hand, but rather accept it as a legitimate basis for negotiations. Her biggest advantage is that the majority of Sinhalese public opinion is clearly in favour of a negotiated settlement. The 1994 election is the first since 1956 in which anti-Tamil 'competitive chauvinism' did not come into play, because the leader of one of the two major Sinhalese political formations finally found the courage to refuse to engage in that odious game. Even a few years ago, courting the Sinhalese vote on a platform that called for direct, unconditional talks with the LTTE leadership (as Kumaratunga did) would have been an invitation to political suicide. This time, exhausted with an unwinnable, prohibitively expensive war that has brought death, destruction and misery throughout the island (not just the Tamil areas) and corrupted and criminalised Sri Lanka's democratic fabric, a large chunk of the Sinhalese electorate rejected the parasitic chauvinists and warmongers, and their bankrupt fantasy of a 'military solution'.

In acting on this mandate for peace and reconciliation, Kumaratunga must keep in mind not just the constraints within Sinhalese politics that limit her room for manoeuvre (on which more later), but also that the LTTE leadership will, by and large, be negotiating from a position of relative strength. The Tigers have proved to be an extraordinarily formidable and resilient organisation over the past decade. Today, they control some 85 per cent of the north (including the entire Jaffna peninsula), where they have established a *de facto* state with its own police force, judiciary, taxation structure, education department, transportation system and information and broadcasting networks. They have also consolidated significant popular legitimacy by aggressively opposing various social ills and inequities, such as caste oppression and the subordination of women. Even if the Sinhalese armed forces were to retake this territory (which is doubtful), the Tigers always have the option of reverting to the underground guerrilla warfare they waged with such deadly efficiency against the Indian army between 1987 and 1990 (not to mention devastating suicide-attacks in Colombo and other Sinhalese-majority cities). The capacity of the fanatical youth mobilised by LTTE to fight on regardless of punitive costs has repeatedly been demonstrated. In the eastern province, too, the Tigers remain a menacing presence; they are still entrenched there in forested and rural areas. Effective Tamil opposition to the LTTE remains almost non-existent, not just because of the Tigers' ruthless intolerance of political opponents but also because a sorry record of criminality, 'collaboration' and opportunism has debased the anti-LTTE groups in the eyes of the Tamil population. As an 'Indian Peace-Keeping Force' (IPKF) general found in Jaffna, "Eelam had taken firm root as an idea and the LTTE was firmly established in the consciousness of the Tamils.. [as their] sole saviour, fighter, hero and representative."

At the same time, the Tigers simply cannot hope to achieve Tamil self-determination through military means alone. The absence of international recognition ensures that 'Tamil Eelam' will remain a juridical non-entity for the foreseeable future. And it is questionable whether an economically decimated Tamil society can sustain an extremely protracted and painful war of attrition indefinitely, at least without losing enthusiasm for the political cause. The LTTE's positive initial response to the new prime minister's overtures indicates that Tiger leaders are not unaware of these constraints

and dilemmas. Conversations with LTTE activists based in the west also indicate that the Tigers have considerable faith in Kumaratunga personally, though they remain deeply sceptical of the People's Alliance, which contains many Sri Lanka Freedom Party (SLFP) and nominally 'leftist' elements with a history of anti-Tamil politics.

Core Issue

What, then, is to be done? The core issue in this conflict is the political empowerment of the Tamil people who live in the north and east of Sri Lanka. Piecemeal 'concessions', and the like can never address this problem, especially in the extreme circumstances that have come to prevail. What might yet convince the alienated Tamil population that they have a future within an united Sri Lanka is the reconstitution of Sri Lanka as a highly decentralised, multinational state (of Sinhalese, Tamils and possibly Muslims). This would of course entail major institutional restructuring. At the broadest level it would mean the federalisation or perhaps even confederalisation of Sri Lanka. More specifically it would necessitate the permanent administrative unification of the northern and eastern provinces under the title of 'Tamil Autonomous Region, Democratic Socialist Republic of Sri Lanka', or some roughly similar designation. The concept of 'homeland' is certainly problematic but the practical problems can be minimised by introducing effective institutional safeguards for the rights of the one-quarter of the north-east population that is not Tamil. These are mostly Muslims and autonomous cantonal or municipal assemblies in predominantly Muslim pockets within the region (in Batticaloa, Trincomalee and Amparai districts in the east, Mannar in the north) is one possibility to explore. At any rate, a peaceably negotiated resolution involving Tamil, Sinhalese and Muslim representatives would greatly enhance the prospect that minorities, be they Muslims or Sinhalese in the Tamil-majority areas or the significant Tamil community in Colombo, are treated with equality and respect. An at least partial dismantling of recent government-sponsored Sinhalese settlements in the north-east (under controversial 'colonisation' schemes) would also probably be unavoidable. The Autonomous Region would encompass the entire north, which has an overwhelming Tamil majority, and the eastern districts with the possible exception of Amparai, where Tamils are only 20 per cent of the population. Trincomalee harbour, the prize of the east coast, could be declared a 'free port', to which the Sinhalese authorities and people would enjoy equal and unimpeded access. A recent precedent exists in the Horn of Africa, where newly sovereign Eritrea has guaranteed the Ethiopians access to its Red Sea ports.

The region would be governed by an entity that might be called something approximating Tamil National Authority, Democratic Socialist Republic of Sri Lanka. This authority would enjoy jurisdiction on all matters except those vested in the central government under the federal or confederal model. Even in Sri Lanka, there are important historical precedents for this, in the form of (sadly unimplemented) proposals for wideranging, substantive devolution of power. As early as 1928, the British-appointed Donoughmore Commission urged that provincial councils be formed in Ceylon, with powers of direct taxation (to supplement revenue provided by the centre) and wide responsibility over a variety of subjects including "public works and communications, irrigation and agriculture, medical and sanitary services, education and finance, and general administration". In 1957-58 a famous pact concluded between Kumaratunga's father, prime minister Solomon Bandaranaike and the Tamil federalist leader S J V Chelvanayakam would, if implemented have federalised Ceylon and possibly averted the later catastrophe.

This agreement, abrogated by Bandaranaike amidst hysterical opposition from the Buddhist clergy and UNP politicians like J R Jayewardene, would have recognised Tamil as the language of administration throughout the north-east and devolved powers to autonomous Tamil authorities in numerous fields including agriculture, co-operatives, land settlement and development, education, health, industries, fisheries, housing and social services, electricity, irrigation schemes and roads. It would also have given the Tamil authorities the right to tax and borrow independently. In 1965, yet another important (and unimplemented) accord was reached between Sinhalese and Tamil leaders on the sensitive issue of 'colonisation'. This stipulated that land grants in the north-east would be made, firstly to local landless persons, regardless of ethnicity, secondly, to Tamil speakers resident in the north-east, and thirdly, to other citizens of Ceylon with preference given to Tamil citizens living elsewhere on the island. Many prescriptive aspects of these abortive agreements remain relevant to devising and implementing a viable solution today.

Under the federal or confederal formula, jurisdiction over foreign policy, defence and currency and communications typically remain with the central government. This should be generally applicable to Sri Lanka, with one important qualification. The paramount concern of the Tamil population in the north-east is physical safety and security, above all from the depredations of the Sinhalese armed forces, police and paramilitaries. It is thus unacceptable to them that the Colombo government retains (or rather, given the context, regains) exclusive control over police and military power. This contentious issue will have to be thrashed out across the table. Demilitarisation is an essential and most desirable objective, but it has to be gradual and mutual. Demanding that the LTTE surrender its weapons in the absence of a comprehensive settlement voluntarily concluded between the warring parties and without a corresponding reduction in the bloated government forces, will simply not work (this was among the fatal flaws of the Indo-Sri Lanka accord of 1987). During a putative transition phase, one idea might be to withdraw regular troops (on both sides) to barracks, and set up police forces in the war-zones whose composition more-or-less reflects the ethnic make-up of the local population. This might satisfy the security concerns of Muslim and Sinhalese residents of the north-east, in addition to Tamils. Once a lasting peace has been reached, large-scale bilateral dismantling of redundant military forces, and perhaps, absorption of some LTTE units into a much smaller army under joint Sinhalese and Tamil command should not be a problem.

But the most powerful long-term unifying force between Sinhalese and Tamils is likely to be the imperative to economic co-operation, trade and exchange. The north needs resources and products from the south: the LTTE's vigorous efforts to beat the blockade by building indigenous factories for essentials notwithstanding, Tamil farmers and fisherfolk in the north and east need the south's markets, in addition to their own, for their catch and produce, and the Tamil middle class in Jaffna

needs access to higher education and professional employment opportunities in the rest of the island. A leading Sinhalese economist, who is a former director-general of the United Nations Commission on Trade and Development (UNCTAD), has recently commented that the Sri Lankan economy as a whole will not be able to achieve optimal growth unless the civil war is politically resolved soon. There is thus a compelling case for an integrated (as opposed to centralised) Sri Lankan economy, and this imperative is likely to counteract any lingering 'separatist' tendencies.

Other innovative political structures can be created to strengthen a voluntary, consensual unity built from below. For example, the presently uni-cameral Sri Lankan parliament, elected on the basis of one-person, one-vote and a diluted proportional-representation system, can be expanded into a bi-cameral institution. An upper chamber, called House of Nations or House of the Peoples, might be constituted, with equal representation from the Sinhalese, Tamil and possibly Muslim communities. This house might be specifically charged with mediating and arbitrating any inter-community and inter regional disputes, and vested with the authority to accept or reject any proposals to change the (con)federal constitution of the state. Numerous constitutional precedents exist in multinational states worldwide. And, acting on a Donoughmore recommendation of 1928, this parliament could convene not just in Colombo, but periodically also in Jaffna. Additionally, it could be constitutionally mandated that if the prime minister is Sinhalese, the president must be Tamil, and vice versa (in practice, the executive post would typically be filled by a Sinhalese).

Peace Bandwagon

Obviously, even the partial realisation of such an ideological and institutional transformation presupposes a process of protracted and quite possibly tortuous dialogue and negotiations. Instant fixes are clearly impossible, and there would be many pitfalls and ambushes along the route. Initiation of meaningful dialogue presumes not just a ceasefire but a more permanent cessation of hostilities. Even this will not be easy. Over the years, a particularly belligerent and blood-thirsty element has grown within the officer corps of the Sinhalese army, navy and air force. The rank-and-file, often recruited from the poorer sections of Sinhalese society, are, by comparison, increasingly motivated to join by the carrot of economic incentives, rather than 'patriotism': this partly explains their poor performance against the Tigers. But many officers have a vested interest in perpetuating the war, to which they owe everything from public importance to economic affluence (the latter frequently through various forms of war-related profiteering and corruption).

Many of these hardline elements were in the forefront of the campaign to exterminate the Sinhalese ultranationalist Janatha Vimukthi Peramuna (JVP; People's Liberation Front) a few years ago, and are greatly frustrated by lack of similar success against the demonised LTTE. They will probably find allies among ultrachauvinist Buddhist clergymen, corrupt bureaucrats, and most dangerously, the Sinhalese political establishment, especially the UNP old-guard. Recall that a year ago, septuagenarian UNP president Wijetunga proclaimed that no ethnic problem (just a 'terrorist' one) existed in Sri Lanka, and ordered the armed forces' command to retake Jaffna militarily. The likes of Wijetunga and his adviser, the octogenarian J R Jayewardene, are understandably apprehensive that a just and peaceful resolution to the crisis will consign them, and the policies they pursued and the politics they represented, to the dustbin of history. Though temporarily sulking and defensive, this cabal is far from spent, and their mischief-making potential should not be underestimated. Recent attacks (usually against civilian targets) by the armed forces in the north seem designed to provoke large-scale LTTE retaliation, which would vitiate the climate for negotiations. But the prime minister has done well in choosing Lionel Fernando, a respected non-chauvinist Sinhalese bureaucrat, as her preliminary envoy to Jaffna. There are even rumours that disgruntled UNP parliamentarians close to the slain Ranasinghe Premadasa might desert their party and join the peace bandwagon, if it takes off.

More immediately, Kumaratunga is hamstrung by her wafer-thin working majority in parliament, and by her limited powers under a predominantly presidential system of government. Though committed to abolishing the presidential executive, she might need to run for and win that office in the immediate future in order to consolidate her authority. Moreover, even minor amendments to the constitution require a two-thirds parliamentary majority, not likely to materialise in the present parliament. Thus, a new parliament, based on a realignment of political forces and a clear-cut peace agenda may be necessary to advance the peace process.

It would also be unfortunate if the prime minister were to allow the minor Tamil groups that are supporting her primarily for partisan reasons to impede her dealings with the LTTE. The Sri Lanka Muslim Congress, her main ally, deserves to be taken more seriously, especially because almost 20 per cent of the north-east population (and a full third in the eastern province) is Muslim. The SLMC seems to have realised that Muslim refugees from the east and north can only return to their homes in security after a rapprochement with the Tamil insurgency.

On the Tamil side, it is far from certain that the LTTE leadership and its militant following, brutalised by years of violence, have the maturity, wisdom and patience for a lengthy dialogue. The moderating influence of Sathashivam Krishnakumar (Kittu), the LTTE leader killed by Indian forces in January 1993, may be sorely missed. Yet the Tigers too have compelling pragmatic motives to accept a just political solution. Prabhakaran has already established himself as one of the great military leaders of the 20th century. It remains to be seen whether he can discover the capacity to emulate some figures he admires (like Mandela and Arafat) in making peace. The LTTE also needs to explicitly recognise that its one-party dominance in Tamil politics cannot be sustained, except through sheer force, in the longer term.

The post-cold war international climate is conducive to a negotiated peace in Sri Lanka. The US government has expressed the hope that the new forces in Sinhalese politics will 'aggressively' seek peace with the Tamil rebels, opined that this can be done "only by devising ways to devolve power", and rejected the 'terrorism' hypothesis and its concomitant, the 'military solution.' Western aid would be important in rehabilitating the hundreds of thousands of refugees and internally displaced people (the vast majority of whom are Tamils but also including many Muslims and some Sinhalese), and in rebuilding infrastructure in the north-east destroyed by war. Chandrika Kumaratunga has spoken of how "what has been possible in South Africa and between the Israelis and Palestinians" has given her renewed hope. If she survives physically, it is not inconceivable that she may be able to end a conflict her father and mother did so much to create and exacerbate. With her personal history of pain and loss, she can empathise with the suffering of the countless thousands of war widows and orphans in the north-east and indeed, elsewhere in Sri Lanka. The government of India, whose clumsy, contradictory and self-serving policies have had an extremely baneful effect on this conflict in the past, can make a constructive contribution by staying aloof and not hindering any peace process. A positive outcome on the fractured island would create a remarkable precedent for a subcontinent riven by ethnic conflicts. If the opportunity is squandered, a relapse into massive violence is all but certain. Can Kumaratunga and Prabhakaran rise to the challenge?

[For a comprehensive discussion of and theoretical and comparative perspective on the Sri Lankan conflict, see Sumantra Bose, *States, Nations, Sovereignty: Sri Lanka, India and the Tamil Eelam Movement*, Sage Publications, New Delhi, Thousand Oaks, CA and London, 1994.]

Indian Muslims in Their Homeland

Moonis Raza

The destiny of Indian Muslims is an integral component of the destiny of India. It is the responsibility of the secular, democratic forces, therefore, to raise the specific problems facing the Indian Muslims and put their solutions squarely on the national agenda.

I

COMMUNALISM of many hues and colours—both majority communalism as chauvinism and minority communalism as separatism—has been eating into the very vitals of subcontinental India since the days of British rule. The imperialist power injected this deadly virus into the Indian organism as a crucial element of its 'divide and rule' policy. While the British rulers were forced to quit India, the dark shadows of their policy of divide and rule persisted and continued to darken many important spheres of life therein.

It is important to note at the very outset that the outcome of the 1993 elections has clearly indicated that while majority chauvinism has met with a serious setback and its onward march has been, at least for the time being, halted in its cradle—the Hindi heartland—it still continues to be a considerable force therein, and its capacity to generate and intensify communal tensions continues to be of a frighteningly high order. The maturation of this dangerously anti-national trend was heralded by the wanton destruction in the ancient city of Ayodhya of a 16th century mosque—popularly known as the Babri masjid possessing some rare historical as well as architectural features by a frenzied mob of fanatics at the initiative of the manifold wings and offshoots of the Rashtriya Swyam Sewak Sangh (RSS) parivar. The tacit support as well as encouragement of the Bharatiya Janata Party (BJP) government of Uttar Pradesh to this act of barbarism, the significant and studied inaction on this issue of the Congress government at the centre in complete disregard of both its constitutional obligations as well as national responsibilities and the openly declared threat to repeat the exercise not only at Mathura and Varanasi but in the case of Taj Mahal as well—all these constitute negative features of the contemporary situation and herald the opening of a new phase and a qualitatively higher stage in the maturation of communal chauvinism in the Hindi heartland.

The events at Ayodhya acted as a green signal to a wide spectrum of communalist forces in many other parts of the country. This was particularly true of the Shiv Sena infested metropolis of Mumbai where the Congress Party in power turned a deaf ear to the heart-rending appeals from citizens of the most modern city of the subcontinent to save them from widespread orgies of organised violence—arson and loot, murder, and rape.

Accompanied by the beating of drums in rath yatras, the thunderous entry of the RSS inspired BJP from the side wings to the main stage of the Hindi heartland combined with the shift of its socio-political emphasis from Bharatiyata to Hindutva, poses serious dangers to national unity and calls for a strong response fron the Indian people as a whole—of all religious groups with diverse affiliations. This is particularly true of Indian Hindus whose interests the party claims to serve, and of Indian Muslims who, though intrinsically and deeply involved in the destiny of India, are the main target of barbaric violence. The poignant and distressing destiny of Indian Muslims in their own motherland is particularly so because not only are they deeply rooted in its rich history and respond meaningfully to its varied geography, but their bodies, on death, also become symbolically one with the mother earth of their homeland.

II

It is unfortunate that the paucity of reliable and authentic data about Indian Muslims makes it possible for various anti-national political formations to sow seeds of prejudice about them and fan the fire of suspicion and hatred against them. In the light of the significant number of Indian Muslims and the consequential influence of their involvement in the destiny of India, it is really unfortunate that the decennial censuses or the national sample surveys do not systematically address themselves to the living conditions and demographic characteristics of the 'untouchable' Muslims. It is no doubt true that a small number of census tables were generated for Muslims separately some decades ago. The figures presented such an alarming picture of their plight, led to such a strong protest in parliament and created such a furore among concerned demographers within the acdemia that the matter was carefully and diplomatically hushed up with considerable finesse. Having burnt its fingers once, such tables, to the best of our knowledge, were not generated for the second time. The socio-economic plight of the Indian Muslims remained clouded in mystery.

India Today, reportedly using NSS report of 1988, Reserve Bank of India report of 1992, and the Gopal Singh commission report on minorities of 1984 presented a picture of the socio-economic conditions of Indian Muslims detailed below, which has greatly shocked the conscience of democratic India:

—52.3 per cent of Muslims live below the poverty line with monthly income of Rs 160.00 or less.

—50.5 per cent of Muslims are illiterate.

—Only 4 per cent of Indians who received education up to high school are Muslims.

—Only 1.6 per cent of Indian college graduates are Muslims.

—Only 4.4 per cent of Indians in government jobs are Muslims.

—Only 3.7 per cent of Indians who received financial assistance from the government for starting business are Muslims.

—Only 5 per cent of all Indians who received industrial loans from the government-owned banks are Muslims.

—Only 2 per cent of Indians who received loans from the government are Muslims.

Moin Shakir has focused attention on the fact that the share of the Muslims in the defence services has come down from as high as 32 per cent in 1947 to as low as 2 per cent in contemporary times. The former should have perhaps been lower than what it was but the latter is exceptionally low in terms of social justice. Shahabuddin has estimated the same 2 per cent for employment in public and private sectors. Nadvi has pinpointed the telling fact that only three Muslims were recruited in the Delhi police force between 1946 and 1952. These are a few stray facts, no doubt, from diverse spheres of life and hopefully may not be reflective of the national scene as a whole, but they do indicate the direction in which the winds appear to be blowing in some spheres of the country.

It should be noted that most of the above figures relate to the public sector wherein communal discrimination is more difficult to practise and since data on employment practices is relatively accessible, more difficult to hide. The large and powerful private sector takes recourse to it on a far larger scale, in a far more effective manner, and with greater impunity. Can the concept

of social justice, enshrined in the Indian Constitution, be corrupted to a greater extent than this?

What makes the pitiable condition of Indian Muslims, as depicted above, to be ironically so is the persistent propaganda line of majority chauvinism to the effect that they are the pampered offsprings of mother India who are being offered a disproportionately large share of the national resources to keep their mouth shut. This is akin to adding insult to injury.

It is of some significance to note in this context that in the case of many crores of Indians, belonging to the scheduled castes and tribes, who have been carrying the back-breaking burden of hunger and destitution for more than a millennium, and who are still neck deep in the mire of backwardness and poverty, some positive steps have already been and are being taken to remove these infirmities. The other backward classes (OBCs) too have recently joined the company of the specially favoured. It is unfortunate that the same cannot be said about the sad lot of the *non-scheduled but backward Muslims*. Shunning the 'available easy road' to 'safe' Pakistan even under the dark clouds of the partition riots, they stuck to their cold hearths in *mother* India to be treated, at best, as its step-children.

In spite of the soul-killing ambience of contemporary India with its demoralising ethos of communal bias in many spheres of life and the terrifying ethos of recurring riots, Indian Muslims, like other communities in the country, continue to take spiritual sustenance from their vigorous tradition to keep alive their fond hopes of a less gloomy and brighter future It is in the best interest both of Indian Muslims and their homeland, India, to ensure that these hopes are not shattered.

III

It is heartening to note that in spite of their relative marginalisation in the national economy and the insurmountably difficult obstacles in their path, Indian Muslims are continuing to make their presence felt and put their stamp on a significantly large number of important spheres of life. They have been able to face up to the tough challenges outlined above on the basis of their capacity to put in hard work under the most trying circumstances, a characteristic they share with the rest of their country folk. This is true not only with respect to the rarefied spheres of the hard disciplines, such as natural and social sciences, engineering and technology, but also of the ethereal universe of creativity that includes fiction and poetry, painting and theatre, mime and music, and the popular spheres of films and sports.

In view of the significant contribution of the Muslims to a number of important spheres of life in India and particularly to the synthesis of diverse ingredients in the Indian milieu, it is really unfortunate that this vital segment of the Indian population is being denied its due share in the fruits of national development.

The relative underdevelopment of Indian Muslims is both a Muslim and an Indian problem. Development, it is now generally agreed, is indivisible. The palsied limb weakens the organism as a whole. The relative weakness of developmental impulses within such a significantly large segment of the Indian population as that of the Muslims is, in a vital sense both the cause and consequence of the under development of India.

The tragedy of such a situation calls neither for theatrical tears and futile breast-beating, nor for shouting of vacuous slogans and mock heroics, but for serious heart-searching and critical (including self-critical) analysis. A reasoned and scientific assessment of the present situation with respect to the plight of Indian Muslims has to commence with the recognition of the fact that they are located at the inter-section of two vitally significant sets. First, they are a substantial component of the Indian population—the second largest group in the second most populous country in the world. Second, India has been and still continues to be the motherland of a considerably high share of Muslims inheriting the globe—the number of Muslims in India being their second largest national aggregate, next only to that of Indonesia. It is certainly larger than the combined total population of Pakistan and Bangladesh. This significant and glaring fact points unmistakenly to the obvious conclusion that a larger number of Indian Muslims inhibiting the pre-Pakistan India decided to stick to their homeland facing slings and arrows of outrageous fortune and only a relatively small minority migrated from 'Hindu' India to 'Islamic' Pakistan. The population of Muslims in India is significantly greater than the total population of the two predominantly Muslim countries of considerable importance in the world—Egypt and Iran. It is 11 times as high as the combined total populations of six predominantly Muslim countries of the world—Saudi Arabia, Iran, Afghanistan, Libya, Morocco and Albania. It is clear that both as citizens of the secular republic of India and as members of the world Muslim community, Indian Muslims constitute a subset of unique significance and crucial importance. They are, on the one hand, Indians, united with every fibre of their social being with the history and geography of their homeland; on the other hand, they are Muslims and, as such, they are an inalienable constituent of the world Muslim community, spread unevenly over different units of global space in varying proportions.

The Indianness and Muslimness of the Indian Muslims are both defining characteristics and neither can be ignored nor underplayed in any rationally sound and scientific assessment of the situation. It may appear ironical but it is nevertheless true that both Hindu and Muslim communalists deny the Indianness of Indian Muslims and underline only their Muslimness, of course, for different reasons—the former to denigrate the Muslims and the latter to denigrate India. It is also true that sectarian and narrow-minded Muslims of the Muslim Brotherhood variety quite often consider Indian Muslims to be rather inferior specimens of their co-religionists to be kept out of the charmed circle of good and "god-fearing" Muslims like those of Saudi Arabia or Khomeni's Iran.

It is of considerable significance to note in this context that Indian Muslims are definitionally and simultaneously Muslim Indians as well, end-products of the rich historical tradition of their homeland, and the high degree of geographical diversity therein. India is a country of subcontinental dimensions, and environmental diversities have put their stamp on the life-style of Muslims inhabiting the different regions of the country, as they have in the case of non-Muslims. Muslims inhabiting the dry, cold and mountainous lands in the trans-Himalayas, on the one hand, and those living in the humid, hot and coastal plains of the Kerala coast, on the other, respond to their regional environments in their own ways which are significantly different from each other. The houses they live in, the clothes they wear or the food they eat are region-specific.

The regional specificities of Muslim life in a large and diversified country like India—both the inter-regional differences therein and the commonness between Muslim and non-Muslim life-styles of the same region—are so striking that they cannot be missed even on a cursory glance. If groups of Muslims and Hindus from an Assam, a Kerala, a Saurashtra, a Telengana and an Awadh village were to be put together for some time on an island, the food they would eat, the dress they would wear, and the language of discourse among them, for example, would be region and not religion specific. The regional specificity of life-styles among Indian Muslims acquires considerable significance particularly because they are not evenly distributed over Indian space. While there are regions with heavy concentration of the Muslim population, there are also regions wherein their population is small, marginal or even non-existent. However, taking a total view of the country as a whole, it may be asserted with confidence that Indian Muslims have

been and continue to be an integral constituent of the national ethos. It is also and equally true that they are integrally woven into the multi-coloured fabric of their regionally differentiated motherland.

While the ability of the Indian Muslims to be an integral constituent of the multi-cultural ethos of India is of substantive significance in understanding the nature and complexity of the intricate problems facing them in contemporary India, it is at the same time vitally important to recognise the high degree of heterogeneity among them. Doctrinal variety, social hierarchy and economic stratification are quite pronounced characteristics of Indian Muslims as well—though they are, perhaps, not as marked, open, obvious and proclaimed as in the case of Hindus. These negative features in the case of the Muslims are rooted in the same social phenomenon as in the case of the Hindus—the all-pervasive caste system, which has been sucking the life blood of the social organism in India as a whole for more than a millennium. On conversion to 'casteless' Islam, the Hindu loses his religion but not his caste, and the weavers, even within the new fraternity of 'equals', continues to be the despicable 'jolaha', barely tolerated at the societal periphery. Religious conversion is not only possible but welcome; caste conversion is not only impossible but considered to be fraudulent and detestable.

While caste source is crucially significant in the assignment of status to Muslim converts from caste-ridden formations, the doctrinal spectrum of Indian Islam is itself highly complex and varied. The shias, the sunnis and the wahabis or the khojas, the bohras, and the agha khanis are just a few examples of a large number of differentiations based on religious as well as quasi-religious beliefs and ritual practices. They lead to sect exclusivity and sometimes even to inter-sect riots. Shia-sunni riots or sunni-wahabi tensions are not unknown in the sub-continent. The Islamic republic of Pakistan has solved the problem by excluding the Ahmadias from the sacrosanct sphere of believers.

IV

Some of the popular misconceptions about Indian Muslims, which are rooted in an erroneous view of history, need to be carefully examined with a view to clear the cobwebs of prejudices against them. The most popular of these misconceptions relates to their being 'foreigners' as against the Hindus who are considered to be bona fide sons of the soil and genuine offsprings of the Indian motherland. It is no doubt true that some of the Muslim dynasties had entered Hindustan during the medieval times from central or west Asia—as was the case with 'Hindu' Aryans a few centuries earlier. It is equally true that they had not come to India like the British on a furlough, nor as invading marauders like Alexander (the 'Great'), Mahmood of Ghazna or Nadir Shah who, after cruel orgies of murder and rape as well as arson and loot spread over short durations, went back to their lairs. The invasions of this type, aimed at fleecing the golden bird, were in the nature of an earthquake or a typhoon, highly destructive but temporally ephemeral. As against this, the pathan or mughal dynasties settled down in India and made it their home. Among them were both good and bad specimens, soft-hearted and oppressive rulers, just and unjust kings, as there were among Hindu dynasties of earlier periods and Hindu sub-feudatories during the medieval period itself. In neither case was religion the distinguishing characteristic between the two sets. The falsity of this communalist theory is sharply brought out by contrasting Khusro's kind-heartedness and broadmindedness with his brother Aurangzeb's oppressiveness and intolerance. Both were Muslims, yet were fundamentally different from and arrayed against each other. What is of paramount significance to note in this context is the undeniable fact that the great majority of Indian Muslims, who decided to stay in India and not migrate to Pakistan in the wake of partition, are Indians with deep roots in the Indian soil, offsprings of Indians who have been living in India for centuries and in some cases for a millennium. One does come across a few ghaznavis (from Ghazna), tirmizis (from Tirmiz) or qandharis (from Qandhar), but there is a far larger number of Indian Muslims who proclaim their deep roots in India through a constituent element of their proper names like Gorakhpuri from Gorakhpur, Lakhnavi from Lakhnau, Dehlavi from Delhi or Jallandhari from Jallandhar, even taking pride in their being related to small towns or even villages of their motherland, for example Nonahravi (from Nonahra), Parvi (from Para), or Karhani (from Karhan).

V

Since development is indivisible, the living conditions of a large majority of Indian Muslims, steeped in misery and degradation, are a drag on the progress of the country as a whole and constitute serious obstacles in the difficult path of national development. The destiny of Indian Muslims, in this sense, is an integral component of the destiny of India; and the destiny of India is irrevocably linked with the destiny of Indian Muslims. The two are inseparably intertwined, contingent upon and flowing from each other. The agenda of our times, therefore, calls for the progress of India along with the advancement of its Muslim citizens, and simultaneously for the advancement of its Muslim citizens along with the advancement of India.

Despite the provocations of the Hindutva forces during recent years and the corrupting influence of separatist platforms of Muslim communalists and Islamic fundamentalists, Indian Muslims have continued to play a positive role in the building of a strong and progressive India. It is the responsibility as well as the bounden duty of the secular democratic forces and parties of the Indian mainstream, therefore, to raise the specific problems facing the Indian Muslims from their own platforms singly as well as jointly and to put the solutions of these problems squarely on the national agenda, especially when any movement with separatist demands would be disastrous not only for the nation but for the minorities themselves.

Food for People: Limits of Reform

Madhura Swaminathan

The Politics of Food in Mexico: State Power and Social Mobilisation by Jonathan Fox; Cornell University Press, 1993; x+280.

THIS book contains a useful discussion of an important policy intervention by the Mexican government in the early 80s in the system of food production and consumption. The programme known as the Sistema Alimentario Mexicano (SAM), or the Mexican Food System, attempted to increase production of basic food products (cereals, beans) and to provide a basket of essential food products at reasonable prices to the poor in rural and urban areas. In theory, the SAM programme involved a reversal of agricultural policies pursued since the 1940s, which had favoured export-oriented large producers on irrigated land and private ranchers and not small, maize- and bean-growing peasants. The essence of the SAM programme was the provision of producer and consumer subsidies that were financed by revenues from the oil sector.

An analysis of this food policy intervention is of general significance on two counts. First, it shows the limits of success of a programme of reform that is initiated from above and that does not deal with the fundamental question of agrarian reform. Secondly, Fox uses this case study to build a general model of the effects of state-society interaction on the implementation of a programme of reform.

The central issue addressed in chapter 2 is why and how the Mexican state implemented a policy that gave "a small but significant" degree of power to poor persons. Fox argues for an approach that focuses on "the interaction between state and society" in understanding public policy interventions of a distributive or redistributive kind (p 39).* In the particular case of SAM, Fox shows that the programme was initiated by "reformers" within the state whose capacity to overcome powerful opposition depended on their willingness and ability to find allies in civil society. In chapter 3, Fox provides the historical background to the Mexican state's concern for "rural political legitimacy" (p 41), and the policy of buying social peace in the countryside with occasional concessions and promises.

SAM was designed to affect different components of the food system, including inputs, production levels, marketing, processing and distribution. SAM consisted of three major policy measures. These were, first, the provision of subsidies for producer inputs (such as fertiliser and seed) to increase grain yields on rainfed land; secondly, an increase in producer prices as an incentive to increase the area sown to basic grains and the amount of grain marketed; and, thirdly, the expansion of a system of subsidised retail stores for the distribution of basic food articles. Chapter 4 provides an interesting account of the implementation of SAM. Here is an example of how SAM worked in practice.

The main official agency that supplied agricultural credit was the National Credit Bank or BANRURAL. BANRURAL had a strong influence on production because it was the major source of credit in rural areas, particularly for those cultivating on 'ejido' (or community-owned) land. Prior to SAM, lending by BANRURAL was biased against small foodgrain producers. SAM led to a lowering of interest rates and an increase in bank lending to agriculture. Between 1979 and 1980, lending by BANRURAL increased 16 per cent in real terms; the area financed by credit from BANRURAL increased 49 per cent; the number of producers given credit increased 17 per cent. The increase was even larger the following year. However, there was no major change in the direction of credit flows from BANRURAL between 1980 and 1982. During the same period, credit for livestock increased more rapidly than credit for agriculture. Also, small producers of maize and beans were not given investment loans but only short-term loans, usually in kind. To sum up, while the new food policy led to an overall increase in agricultural credit, it did not "involve any redistribution away from the previously privileged sectors, which continued to receive substantial real increases" (p 97).

The second strategy aimed to raise producer prices that had been falling in real terms since the mid-60s. A policy of guaranteed prices was announced and there were significant increases in the prices received by cultivators for the major food crops. In 1980, the official support price offered by CONASUPO, the National Basic Foods Company, increased in nominal terms by 28 per cent for maize, 55 per cent for beans, and 18 per cent for wheat. Inflation was 28 per cent in 1980 and support prices were raised further in 1981. Despite these increases, grain prices did not reach the previous peak.

A new element of the crop procurement strategy was a Rural Marketing Support Programme called PACE which aimed to provide marketing services to small producers in rainfed areas. Begun in 1975 as a pilot programme, PACE was strengthened and extended as part of SAM. The goal of PACE was "to broaden effective access to the official price as well as to increase the *de facto* price paid to rainfed producers" (p 112).

As in rural India, in many parts of rural Mexico, markets are fragmented and oligopolistic. In remote regions, peasants are forced to sell their produce to the local moneylender-cum-trader or large landowner. Rural markets are also affected by 'caciquismo' or bossism which results in exploitative interlinkage of transactions in different markets. PACE "explicitly attempted to weaken local marketing oligopolies, one key source of 'cacique' power" (p 131). To compete with private traders, PACE provided marketing-related services such as processing facilities, rebates to meet loading costs, free loan of large bags and a discount to cover the costs of transporting the grain to the government reception centres.

PACE expanded in a big way during SAM; between 1980 and 1981, for example, there was a 400 per cent increase in maize sales to CONASUPO through the PACE programme. Fox's overall assessment of PACE is that "though much of its budget reached small producers, it did not effectively intervene in the rural balance of power because it did not actively encourage collective action in defence of peasant interests relative to either the state bureaucracy or private grain traders" (p 150).

The third component of SAM aimed to improve nutrition security among the poor by providing access to a basket of essential foods at a subsidised price. This was done through a system of generalised food subsidies and a system of government-run retail stores. Subsidies were given to processors and distributors of intermediate products such as wheat flour or maize flour who were required to sell final products such as tortillas and bread at fixed prices. These subsidies were attacked by conservatives in the government. At no time, however, were these subsidies large in national or international comparative terms. During the SAM period, 1980-82, the total subsidy given to CONASUPO averaged 2.5 per cent of the federal budget (as compared, say, with Sri Lanka's food subsidy which accounted for 15 per cent of total government expenditure).

The distribution of food through the rural network of stores grew sharply during the SAM period. Planners identified four

conditions to ensure that subsidised food was delivered to the poor: first, a guaranteed supply of food; secondly, a storage network; thirdly, a transportation network; and fourthly, genuine community participation. A key organisational innovation of SAM was the involvement of the community in the supervision of the system of retail food distribution. The management of rural stores was put under the "direction of *elected* village committees" (p 116, emphasis added). Each village committee was to choose two representatives to be on the Community Food Council, a regional body, to ensure that subsidised food reached the village stores on time.

In conclusion, SAM was a belated attempt by the Lopez Portillo government to regain political legitimacy in rural areas. The oil boom of the late 70s allowed agricultural agencies to channel more resources to previously excluded peasants and small producers in marginal areas while continuing to increase allocations to their traditional clientele of large producers in irrigated zones and private ranchers. Only one component of SAM, the system of retail food distribution, was effective, to a small though significant degree, in altering food security in the countryside and in involving communities in the implementation of government programmes. Despite the good intentions of those who designed the programme, SAM became a policy for increased grain production and the distributive effects of SAM were weak. The Mexican experience with SAM shows that unless the balance of power in rural areas is changed, as say by land reform and genuine democratic control over decision-making, there can be no effective redistribution of resources.

SAM ended with the debt crisis of 1982. The 80s were a period of deep recession in Mexico, a period when orthodox structural adjustment and stabilisation programmes were implemented. It is well established that these policies reversed the redistributive trend of the previous years as income inequality worsened and there was a fall in the living standards of large numbers of Mexicans [Lustig 1992]. There was a sharp fall in real wages, a rise in open unemployment in urban areas, and in general, a redistribution of income from owners of labour to owners of capital. Expenditure reduction as part of structural adjustment led to the slashing of generalised food subsidies and the government shifted to a system of targeted food stamps. These changes in food policy were associated with a quantitative and qualitative worsening of consumption among the poor [Appendini 1992].

The roots of the Zapatista uprising in Chiapas on January 1, 1994 can be traced to these growing social and economic inequalities. As Jonathan Fox pointed out in this journal a few months ago (May 7, 1994) Chiapas is a region with "notoriously unequal distribution of land...largely untouched by agrarian reform" (p 1119). The long-term problems of the rural economy of Chiapas were exacerbated by the fall in prices of coffee, cattle and corn and the decline in government expenditure on rural development programmes including programmes of agricultural credit. The discontent in rural Chiapas and among other marginalised groups in Mexico reflects the fact that economic policy after 1982 weakened the poor and strengthened the rich. The Zapatistas have forcefully brought back distributional issues to the centre of the development agenda.

Note

* The distinction between distributive and redistributive programmes is as between positive sum and zero sum options.

Nuanced View of Swidden Cultivation

Mahesh Rangarajan

Shifting Agriculture and Sustainable Development: An Interdisciplinary Study from North-Eastern India by P S Ramakrishnan; Unesco Man and Biosphere series, Volume 10, Oxford University Press, Delhi, 1993; pp 424, Rs 475.

IN colonial Java, the Dutch had a simple word to describe shifting agriculture. They called it 'raubban' or a form of 'robber economy'. Unfortunately for the cultivators, the label has stuck. Foresters in colonial India and Indonesia excorciated swidden farmers for depleting timber trees. Agronomists pitched in by pointing to the low level of 'surplus' produced by traditional forms of agriculture. More recently, swidden cultivation has become the target of the ire of conservationists who feel it is reducing diverse tropical forests to degraded habitats for fewer plant and animal species. In the main, it is anthropologists who have tried to portray swidden cultivation in less unflattering terms, mainly by arguing that it is a cultural adaptation to local ecological situations. In this version of the story, it is modernisation that is the main culprit, destroying age-old cultural practices that had ensured ecological renewal. None of these constitutes a satisfactory explanation. The major change in recent years has been the elaboration of a more nuanced and complex view of swidden agricultural systems. The earlier debate, especially, among the critics of shifting cultivation was often centred on "widely accepted myths, and that explains the widespread failure of developmental schemes involving swidden agriculturists". Conversely, the anthropologically informed defence has also assumed a level of isolation and cultural harmony that does not square with the rich and diverse kinds of relations between swiddeners and the wider society [Dove 1985: 85]. It is essential in rolling back the old stereotypes, that a new and equally potent one is not put in their place.

This is the central achievement of this meticulously researched and well-written book. India's north-eastern hill states are a geographically diverse and culturally heterogeneous region, with the largest complex of shifting cultivators in south Asia. The hill areas of Assam and the six hill states have, however, largely been neglected by scholars. Unlike in peninsular India where these forms of land use had been decisively rolled back (except in pockets such as Abhujmarh in Bastar) by the coming of independence, the north-east retains large communities of swiddeners. In turn, the newly independent government recognised the rights of village communities in the hill states to a degree unprecedented in the rest of India. Yet, the scales have been tilted against the swiddeners. By 1975, the Indian Council for Agricultural Research had opted for phasing out 'jhum' as it is known in favour of terraced farming and other permanent systems of cultivation. Through rigorous studies over the last two decades, the author has consistently made the case for a more nuanced approach, integrating elements of jhum with innovations in agroforestry. With this book, P S Ramakrishnan has provided a veritable steel-trap to seal his case. Terraced cultivation has not been adopted by farmers in the hills because it is simply not suitable to the terrain. In fact, in terms of maintaining soil fertility in the humid tropics, there is, as yet, no system that matches jhum. The longer view of soils and regeneration that was built into jhum

also means that it is futile to make simplistic comparisons with terraced farming. In any case, the latter requires a level of capital inputs which are not accessible to the producers.

The factors that govern the viability of jhum are sketched out with reference to various parameters: energy budgets, economies of village ecosystems and nutrient recycling. This is not a simplistic argument for retaining jhum in its unreconstructed form. Jhum, after all, comprises a complex series of systems, rather than a monolithic and uniform method. Much depends on the local ecological and cultural milieu. The major variable is the length of the fallow: in general, this has been sharply reduced in the north-east from an average of 10 years to as little as four, five or even less than one year. The primary factor in restricting access to land and destroying the forests are "the activities of industrial man", not the jhum farmers (p 366). The author wisely eschews any simple model based on population growth as the major source of pressure or as the source of agricultural innovation. Jhum, in its historically constituted forms, left behind not a wasteland, but a diverse biome, rich in plant life. One problem in making blanket statements about the ecological viability of the practice is that this may ignore the local ecological dynamics. For instance, the Khasis of Meghalaya grow very different crops in jhum sites in the lower and higher slopes. Both the rates of use and renewal of nutrients are, thus, very different. In addition to the length of the fallow, the specific crop mix has to be taken into account.

The main advantage of this study is that it steadily builds up a regional overview. In place of a tribe located in a particular range of hills, there is enormous attention to the kaleidoscope of peoples that make up the population of the hills. The immigration of Nepalese, with their preference of cows as opposed to pigs, has major implications for agriculture. Similarly, one group which is able to sustain swidden with fewer modifications, the Nishi in Arunachal is able to do so for both demographic and political reasons. Arunachal Pradesh has the lowest population density of any Indian state, even lower than that of the rest of the north-east. Also, Nishis are able to dominate the other land users in their sub-regions: the Kachari, the Chackma and the Karbi. In any case, many groups who have been native to certain tracts for longer periods now combine jhum with other forms of production. Often, their fate hinges on the flexibility of their older mix of production systems. In the increasingly desertified region of Cherrapunji, for instance, home gardens now play a more central role than in the past. The case studies lay the ground for the final part of the book, which discusses alternative strategies for the region. Ramakrishnan highlights both the limitations and the potential of the practices adopted by cultivators. Earlier, they often left stumps in place, enabling easy regrowth during the fallow period. But one way out would be to build on the innovative spirit of jhum farmers themselves. In many areas, notably in parts of Nagaland the cultivation of the Nepalese alder (Alnus nepalensis) has helped fix nitrogen in the soil. Tribals often spared the tree in their plots and these traditional practices can now be drawn upon to widen their resource base and opportunities.

This book has implications far beyond the north-east. The methodology, of painstaking field work in different kinds of terrain, should be a model for ecologists and social scientists alike. The author shows a deep empathy for local custom, as in his comments on the sacred groves in the Khasis hills. Certain traditional customs can, it is shown, protect and preserve diverse species. Yet, he stops short of any rural arcadian view. What we have instead are glimpses into a complex and changing world, where elements of the old and new can just possibly be combined to ensure growth with minimal destruction. The rich material on energy flows and nutrient cycles in this book is certain to stir further debate on the ecological consequences of older land use systems. There is, however, enormous scope for more work on the relationship of swidden with plant and animal diversity. Certain species actually thrive in the secondary vegetation that springs up on the fallow land. Yet, there is a crying need for fresh work that asks the more difficult questions. What kind of diversity can be best conserved in such environments? Conversely, are there certain kinds of plants and animals that cannot co-exist with shifting cultivation? These and other questions await further enquiry.

The only major shortcoming of the book is the absence of comparative perspectives. The references exclude Paul Richards' very significant work on west Africa [Richards 1985] and Kunstatder's volume on south-east Asia [Kunstatder et al 1978]. In fact, the conclusions of this book can help in generating useful comparisons. In India, as in west Africa, the debates within the colonial bureaucracy swung decisively against the shifting cultivator. As in south-east Asia, swidden agriculture often involves groups on the fringes of the power structure. Do ethnic differences increase or brake the pace of pressure from above? Presumably the obsession with promoting terraced cultivation at all costs reflects a desire to homogenise cultures and life-styles which is shared by dominant groups in many ex-colonial countries. The north-east, like the Thai highlands or the hill ranges of inner Vietnam is an 'internal frontier'. The drive against the swiddeners is only one aspect of incorporation into wider state systems on an inequitable basis. Ramakrishnan's research is all the more significant because the ecological complex of south-east Asia is more similar to this region than perhaps any other part of the Indian sub-continent.

Comparisons with the tribal belt of middle India could also be useful. The north-east was a strategically more fragile and geographically less accessible region than middle India. Does this explain the relative failure of policies of containment? In areas like Malabar and the state of Rewa, adivasi shifting cultivators had to pay a part of their produce to landed intermediaries, in addition to providing forced labour. It would be instructive to know if similar hierarchies within indigenous societies did or did not exist in the north-east. If the hierarchies and divisions are less pronounced, it might give co-operative systems of land use a better chance of survival. Here is rich ground for the student of the history of changes in the land. All this takes us to a very different realm, one for the historian and the political sociologist.

The limitations of the book in no way detract from its qualities. It is undoubtedly a landmark study of its kind of a region largely neglected by scholars. It also provides fresh insights into the pros and cons of the development process and is a must for anyone interested in ecology or rural studies.

India as It Is

G P Deshpande

Changing India: Bourgeois Revolution on the Subcontinent by Robert W Stern; Cambridge University Press, 1993 (Indian edition published by Foundation Books, New Delhi); pp xviii + 257, Rs 125.

ROBERT STERN's book was written about India "by an Australian author for a western readership", as he puts it in his preface. In fact he concludes his preface to the Indian edition with a clear notice to his Indian readers that he "did not write it for you... So for you it is a work in the literature of eavesdropping". These sentences are cited to make just one point. Stern's account of India is very readable. He knows his India and he has organised his material neatly and the book serves the purpose of introducing contemporary India carrying all its historical burdens to "adequately educated general readers".

The book has been divided in two roughly equal parts. The first deals with "...the history, mostly from the urban top, of bourgeois revolution and change in Indai". It is not easy to review 'the literature of eavesdropping'. The basic argument of the book is that India is changing (as indeed it always has been) and that it is possible to indicate the broad direction of that change. Stern might be overstating the case when he describes the last 45 years as a "bourgeois revolution" as defined by Barrington Moore Jr. But then he concurs with Moore that the "main problem, after all, is what happened and why, not the proper use of labels".

That 'caste' occupies the central place in Stern's discussion of 'what happened and why' should be a major plus point of the book. Caste has been an exclusive preserve of sociologists/anthropologists. Our political scientists and economists have not bothered much about this institution. There is some point therefore in opening a discussion of modern and modernising India with a discussion of caste. It appears, however, that in Stern's view the institution of Varna is as old as Hinduism itself. He refers to *Purusha Sukta* in the *Rig Veda*. Most sanskritists agree that the *Sukta* was probably added to the *Veda* by latter-day commentators. There is otherwise no discussion of Varna in any of the four *Vedas* and the *Upanishads*. The Varna system is essentially a product of the period of the *Smriti* literature. This is the reason why Ambedkar chose to organise public burning of the *Manu Smriti*. The point is that Stern seems to consider the institutions of Varna and Jati without reference to a temporal framework. The term 'Varna Dharma' is not of the Vedic times. His discussion gives an impression that it is. When Varna society became a Jati society and whether the two systems had anything to do with the development of economy and history in India (Sharad Patil's work is worthy of mention here) are crucial question, and one cannot say that Stern's account attempts an answer to them.

He says in the introductory remarks that the term Sanskritisation has not left its distinguished anthropologist-author particularly sanguine about its meaning, making him describe it as a "questionable label". Stern's account, however, does not quite treat it as a questionable label (see chapter 2). It is nice to know that M N Srinivas thinks that Sanskritisation is a questionable label. Perhaps it is worse. It has become a cliche in Indian discussions, as Stern must have realised in those numerous discussions he attended where he employed his trick "to gradually withdraw from active participation to fade into the conversational background".

Anyway, Stern's account of recent Indian history, of India's foreign policy, especially its power and national interest base, and his discussion of the post-Ayodhya scene, while not indisputable, are clearly realistic. His realistic approach expresses itself when he states that "there has not been and there will be no plebiscite in Kashmir" (not because he necessarily shares the Indian government's view on Kashmir) and then goes on to add in the next paragraph that there will probably be no war between India and Pakistan either (p 224). Obviously this is not the argument of a human rights activist or a what-is-this-nation-category-asking-liberal: This is the argument of a realist in international politics. The book reflects this realism in many places and a willingness to understand politics as it actually unfolds. There are no hymns to great India here. Equally, there are no attempts to run down the idea of India itself.

Stern says that there is "a persistence in India's international politics". Indeed there is persistence of and in India itself. In a way, Stern's book brings out that persistence which has always been there. Whether 'changing India' would mean the gradual disappearance of that persistence is more than Stern or anybody can say. In the meanwhile, he has given us a clear, compact, introductory volume on India as it has developed and as it finds itself in 1993.

Issues in Financial Liberalisation

Mihir Rakshit

The basic questions relating to financial liberalisation may be grouped under two broad categories First and the most important for developing countries to what extent has private initiative to be supplemented by state intervention for creating an efficient financial structure? Second given the structures of the financial system, is there any scope for public authorities to influence or suspend the operation of market forces in order to promote saving, investment, and allocative efficiency in the system?

I
Introduction

THE purpose of the paper is to examine the scope for and limits to government intervention in the financial sector of less developed countries Until the early 80s commercial banks and other financial institutions in almost all these countries were nationalised, interest rates were fixed below the market clearing level directed credit programmes with minimum targets for priority sectors like agriculture and small industries were extensively in vogue and governments appropriated a substantial share of total credit at low rates of interest [Hanson and Craig 1986] The resulting financial repression was regarded by the dominant group of development economists as also by international financial institutions as one of the most important sources of inefficiency low saving and poor growth in developing countries [McKinnon 1973 Shaw 1973] However belying the expectations of mainstream economists in a large number of third world nations the initiation of financial liberalisation under the Structural Adjustment Programme- with unfreezing of interest rates privatisation of banks and abandonment of directed credit systems—was followed by widespread bankruptcies a fall in the saving ratio and stagnation or decline in gross domestic product [Corbo and de Melo 1985 Diaz Alejandro 1985] While it is difficult to unscramble the effects of financial liberalisation from other policies pursued by the governments, in the light of the experience of a large number of Latin American and Afro Asian countries McKinnon admits, "all is not well in the liberal camp", and "recognise(s) that our knowledge of how best to achieve financial liberalisation remains seriously incomplete" [McKinnon 1988] It thus appears worthwhile to go back to the basics of financial liberalisation some of the most important of which seem to have been ignored in the recent debate

While clearing the decks it is important to distinguish the core from the peripheral aspects of the programme of financial liberalisation The core consists of (a) abolition of directed credit programmes and control over interest rates and (b) promotion of competition among banks Thus the programme does not necessarily imply privatisation of all commercial banks But it does require that there should be no bar to the entry or exit of private banks, and that nationalised banks if there be any must operate entirely on the commercial principle and compete on an equal footing with private banks Again not only would there have to be deposit insurance and strict supervision of activities of banks in order to avoid the crisis of confidence or runs and to ensure that banks do not betray depositors trust but the central bank must also exercise control over the supply of *total* money and credit for correcting macro economic imbalances Hence the new structuralist thesis that an increase in the interest rate on bank deposits is likely to cause cutback in output through a fall in the supply of total credit[1] [van Wijnbergen 1983 Taylor 1983] does not constitute a serious critique of financial liberalisation With the unfreezing of *all* interest rates if the supply of total credit in the economy turns out to be inadequate for sustaining full employment output, what is called for, the liberal camp might argue, is an expansionary monetary policy so that at the market clearing rate(s) of interest investment equals saving at the full employment level and the degree of financial intermediation is optimum"

The basic questions relating to financial liberalisation may be grouped under two broad categories First and the most important for developing countries to what extent has private initiative to be supplemented by state intervention for creating an efficient financial structure? Second, given the structure of the financial system is there any scope for public authorities to influence or suspend the operation of market forces in order to promote saving, investment and allocative efficiency in the system?

Section II is devoted to an examination of the first set of issues We draw attention to some of the most important sources of market failure in the financial sector which, as the older generation of development economists have emphasised, require the state to play an active role either directly or indirectly The rationale for such intervention lies primarily in the gap between the social and the private returns on the extension of banking services to the unorganised sector in general and rural areas in particular—a gap that calls for setting up of nationalised banks or subsidy to private banks to bring all investors and savers within the fold of an integrated financial system Section III draws attention to issues relating to saving and allocative efficiency under the prevailing fiscal and financial structure and to some of the problems of macro-economic management in a fully liberalised regime The final section provides an overview of main results and underlines the major areas where financial liberalisation needs to be tempered with substantial control by monetary authorities

II
Development of Financial Sector

Even though credit markets in LDCs are grossly underdeveloped and fragmented the debate between the liberal and the structuralist camps has been conducted with little attention to the promotional aspect of monetary policy The Shaw McKinnon school recognises the crucial importance of financial inter mediation but in their enchantment with the benign role of a flexible interest rate mechanism they seem to have ignored the overwhelming evidence relating to the failure of private initiative in developing an efficient financial infrastructure where the mechanism can work effectively The emphasis on the efficiency of kerb markets in structuralist models also betrays an inadequate apprecia-tion of macro-economic and allocative implica-tions of these personalised and fragmented markets with hardly any link between them [Owen and Solis Fallas 1989, Rakshit 1982, 1989] In the absence of a well developed stock market the savers do not generally lend to final users of credit,[3] and those who do limit their lending to close acquaintances or others over whom they can exercise substantial economic and extra economic power

The important point to note in this connection is that left to themselves private entrepreneurs do not set up banks in rural areas or extend credit to farmers artisans or other producers in unorganised sectors Setting up of nationalised banks in rural areas and special dispensation in respect of the allocation of credit to farmers or small business units have often been justified on grounds of equity or dispersal of economic activities We shall largely abstract from these considerations concentrate primarily

on the impact of the development of financial infrastructure on resource utilisation, allocative efficiency and growth; and suggest how at the earlier stage of economic development the social return on investment in banking is generally much higher than the private return.

Macro-Economics of Unorganised Credit Markets

It is worthwhile recapitulating at this stage the major routes through which underdevelopment of the credit market affects production, investment and growth in an economy. First, with imperfect competition in, and immobility of funds across, various sub-markets, unfulfilled demand for credit co-exists with excess supply so that the effective levels of investment and saving tend to be low though the overall propensity to save and invest can both be high [Rakshit 1989]. Injection of high power money into the system, it is important to note, will have little impact on investment since there is no mechanism through which additional money balances could be used for extending loans to prospective investors. The deficiency of aggregate demand can no doubt be avoided through an increase in consumption as real balances rise and there is an increase in the prices of gold,[4] or land or other non-reproducible assets. Thus in the absence of public investment, the (effective) saving ratio at the 'full capacity' output level (secured through appropriate macro-economic management) will be fairly low. When the large majority of investors are not served by commercial banks, an expansionary monetary policy may raise investment in the organised sector, but such investment will still be inadequate to realise the saving potential of the economy at full capacity output.

Second, traditional macro-economic policies do not ensure the required supply of credit for working capital to producers in the unorganised sector. Thus 'full employment' in the Keynesian sense will be characterised by underutilisation of resources due to lack of adequate financial infrastructure.[5] The incidence of such underutilisation tends to be high when a substantial part of the country's resources, e g, land, labour and entrepreneurial skill, are area specific or immobile across sectors. When final goods are mobile, lack of investment demand in the informal sector (due to credit constraint) can perhaps be made up by an expansionary macro-economic policy; but such policies cannot relax the constraint on output operating through the non-availability of production loans to farmers and other producers in the unorganised sector.

Third, there are important categories of investment goods, e g, those of the land augmenting variety, which are produced in the very process of investment and are specific to areas and sectors. In such cases, extension of investment loans generates simultaneously both demand and supply in the [illegible] even if for other goods there is a supply side failure due to the shortage of working capital.

Fourth, an important feature of unorganised money markets is the preponderance of consumption loans a major share of which goes to families with a high incidence of unemployment. The implication is unrealised production and investment potential of the economy. Indeed, there is substantial scope for raising the saving ratio in a developing economy even when the supply of consumption goods is limited. To see how, consider a labour surplus economy where improvement of land for agriculture, forestry or fishery can be undertaken through employment of labour alone. With sticky wages investment would, to be sure, tend to raise the demand for consumption goods. However, were there a substitution of investment for consumption loans, realised saving will be higher without any significant inflationary pressure. The inflationary tendencies would anyway be transitory and moderated by the expectations of an increase in the output of consumption goods in response to (land-augmenting) investment.

Finally, fragmented loan markets lead to gross distortion in the allocation of investment. Large inter- and intra-sector differences in the return on capital tend to persist. Unlike banks, which can convert—thanks to the law of large numbers—a fair part of even demand and short-term deposits into loans for long-term investment, creditors in the unorganised sector do not finance investment in fixed capital because of its extreme illiquidity and high risk[6] [Rakshit 1982]. Nor can producers, with the limited funds they can garner, exploit the economies of scale or of vertical integration of the production process.

A Cost-Benefit Approach to Investment in Financial Infrastructure

Our analysis of the effects of financial underdevelopment suggests how extension of banking facilities to rural/unorganised sectors of the economy can play an important role in the process of economic development. Given the financial infrastructure and resource endowment, the economy can enjoy, under appropriate macro-management, some maximum levels of real income, saving and growth. To make matters simple, we consider a steady state equilibrium where, with no promotional monetary policy, the relative size and efficiency of unorganised and organised sectors do not change significantly over time.[7] The income path of the economy may then be approximated by the Harrod-Domar relation

(1) $Y_t = Y_0 e^{\sigma s t}$

where Y_0 is initial income, s the saving ratio and σ the output-capital ratio.

The sources of increase in output over time due to an improvement in financial infrastructure may then be grouped under three heads. First, given the resource endowment and technology, greater inter- and intra-sector mobility of funds (backed by suitable macro-economic management) raises the 'full employment' output level through (a) greater capacity utilisation; and (b) an improvement in the allocative efficiency of existing resources. Second, the aggregate saving ratio will tend to go up with the extension of credit facilities to investors, the decline in the incidence of consumption loans, growth in per capita income and a rise in the tax-gdp ratio.[8] Third, there is an increase in the overall productivity of investment as industrial organisation and allocation of investment become more efficient and producers acquire greater freedom in choosing the durability and scale of fixed capital employed in a particular line of activity. If the (proportional) increase in output from the initial resource endowment is α_1 while the rise in the saving and the capital-output ratios are denoted respectively by α_2 and α_3, the new income path is approximated by

(2) $Y_t^* = Y_0 \ (1 + \alpha_1) \ e^{s\sigma (1+\alpha_2+\alpha_3)t}$

The implication is that there will be a jump as also an anti-clockwise rotation in the time path of income. However, since the reallocation of resources (especially in respect of fixed capital) cannot be instantaneous, the initial jump in output will be primarily due to greater capacity utilisation, and it is only gradually that the full impact of productivity improvement will be felt. Note that to the extent the additional output and employment generated through extension of banking to the unorganised sector does not involve withdrawal of resources from elsewhere, the whole of the additional output of the unorganised sector constitutes a net gain to the economy. It is possible that reorganisation of productive activities following an extension of financial infrastructure causes a decline in output in some sectors. But even so, the net increase in output can be substantial with the improvement in allocative efficiency of resources.[9] In assessing the social return on investment in banks note that since banking service is an intermediate input[10], its contribution is already incorporated in the final product, Y. The net return on investment in financial infrastructure is hence reflected in the time profile of additional income, $\Delta Y_t = (Y_t^* - Y_t)$, enjoyed by the economy. $\Delta Y_t > 0$ for all t's reflects our assumption that this net return is unambiguously positive for the developing countries we have in view.

We have ignored so far both the investment and the operating costs of new banks. The presence of operating costs does not pose much a problem for our analysis: ΔY_t will be positive for an enlarged financial infrastructure so long as the availability of other resources is not reduced.[11] There would be a decline in the supply of resources (other than banking services) in the short run if investment in bank involves the withdrawal of scarce

resources from elsewhere. Even with such withdrawal there need be no decline in the output of consumption and (other) investment goods when extension of banking makes possible an increase in capacity utilisation and improvement in allocative efficiency.

PRIVATE INITIATIVE AND PUBLIC INTERVENTION

In the context of the key role of financial infrastructure and the failure of private initiative in extending banking services in LDCs, it is useful to examine the main reasons for this failure or to locate the major sources of the difference between the public and the private returns on investment in banking. To an individual banker, the fixed cost of extension of banking services to rural areas or unorganised sectors tends to be high in relation to the potential size of the market. The market is generally thinly spread, and fixed costs are due to not only setting up of new establishments, but also gathering of information and building up goodwill—factors which are of crucial importance in the financial market. To the extent such investment involves the use of unemployed resources, their social cost is zero, but the cost to the private banker can be substantial.[12]

Much more important perhaps is the difference between the social and the private operating surpluses on new establishments. The private operating surplus is nothing but interest receipts on bank loans less the operating cost consisting primarily of interest on bank deposits plus labour and other costs of handling bank transactions. There are several reasons why the operating surplus from the viewpoint of the economy differs significantly from that entering into the calculations of the private banker. First, when new banks use unemployed labour and non-labour resources for carrying on their operations, there is no cost to the society. Second, the major part of the operating cost of banks is accounted for by the interest on bank deposits and this, in a perfectly competitive environment with full employment of resources reflects at the margin the opportunity cost of holding alternative forms of assets, e g, loans to firms or direct investment. In other words, the interest banks have to pay reflects the return on investment not financed through intermediation by commercial banks (less the liquidity premium on bank deposits). Consider however the case where establishment of new banks supported by an expansionary monetary policy raises the amount of bank deposit and the supply of credit to producers in the unorganised sector. Assume further that the resulting increase in productive activity does not involve any withdrawal of resources from elsewhere. In this case the additional bank deposit is in *equilibrium* part of the additional saving as incomes rise with the expansion of bank credit. In other words, though the social cost of additional bank credit is zero, individual banks have to pay interest on deposits required to support the credit. This is as it should be since with positive yield on investment (under the enlarged banking sector), returns on bank deposits have to be positive in order to ensure optimum allocation of resources routed through various banks (and other financial organisations).

Third, the interest banks can charge on loans is less than the *net* increase in output due to extension of bank credit. The reason lies in (a) positive cost of employing unemployed resources by producers; (b) the possible increase in input prices due to greater demand and reallocation of resources to their more productive uses; and (c) inability of banks to mop up the entire profit.[13] Again, when investment is lumpy and there is a complementarity between bank loans and other types of finance,[14] interest accruing to banks will be less than the additional surplus attributable to bank credit.[15]

The basic reason for the shortfall of the private from the social return is positive externality in the form of gains to borrowers and owners of factors which cannot be internalised by banks. The externalities creating a divergence between the two returns assume special significance when the financial market is imperfect and the scale of operation of an *individual* bank is limited by the deposit or the demand for credit. Under these conditions, while assessing the return on investment, banks pay special attention to the prospects of additional deposits that can be mobilised or the demand for loans from credit-worthy borrowers. In most developing countries savers in the unorganised sector, even when located in rural or semi-urban areas, can hold their saving in the form of bank deposits or other financial assets.[16] Hence banks will generally take a dim view of the prospects of mobilising substantial deposits by setting up branches in rural areas (or by investing in the necessary network for extending loans to artisans or small business units in urban areas). An individual banker will not be guided by the economic mechanism through which additional credit, generated through an expansionary monetary policy, will raise the *aggregate* amount of bank deposit.

Even when banks do not find any problem in securing funds or the central bank stands ready to supply credit to banks at a given rate of interest, the market for loans faced by the new bank will be less than the demand for credit generated over time. The reason lies partly in the complementarity between investment in the unorganised and organised sectors. Thus an increase in the production of agricultural goods tends to raise the profitability of industrial enterprises and enables bankers in the organised sector to extend their volume of lending.[17] More generally, the new bank can expect to secure only a small part of the growing market for banking services it has helped to promote. To see why, consider the increase in the time profile of additional income, ΔY_t, brought about by the setting up of a new bank. In the initial round the additional net income is due directly to the loan extended by the bank (though it can appropriate only a part of this income). In the subsequent phases of the development of the economy the growth of income is boosted with an improvement in the allocative efficiency and an increase in the saving and investment propensities. But the major part of the resulting additional demand for finance will be met by other banks (in the organised and unorganised sectors). Again, part of the additional investment will be financed from own funds or borrowing from households and non-bank financial intermediaries.

To summarise let π be the share of operating surplus in output and β the fraction of operating surplus going to banks. In the initial period the new bank can expect to enjoy a profit of $\beta\pi\Delta Y_0$. However, for $t > 0$, the time profile of profits of the new banks is approximated by $\delta\beta\pi\Delta Y_t$ where δ is the share of the banking service the new bank will provide. The smaller the values of π, β and δ, the greater the influence of externalities in causing suboptimal investment in banks catering to unorganised enterprises. Liberalisation of the financial market *may be* the most effective means of promoting saving and allocative efficiency *under a given financial infrastructure;* but there is a strong case for public intervention in order to ensure the extension of banking services and development of an integrated financial system.

III
Saving and Allocative Efficiency

The case for financial liberalisation lies primarily in the adverse effects of administered interest rates and directed credit programmes on saving and allocative efficiency. The presumption is that aggregate saving is positively related to the rate of interest so that when the interest rate is fixed below the market clearing level, realised saving will be less than what would obtain under competitive conditions (with 'full employment' of resources). Again, excess demand with rationing in the credit market implies that funds are not allocated on the basis of productivity of investment. Hence the 'hands off' policy for the financial sector advocated by the Shaw-McKinnon School.

Such a policy is not however entirely consistent with the perception of development economists that under the free play of market forces saving will be suboptimum. In the first best world the government must rely on (non-distortionary taxes in order to promote aggregate saving, but the allocation of investible resources should be determined through the interest rate mechanism.[18] However, the task of overhauling the tax system to promote saving and equity has proved beyond the capacity of most developing countries. Collection of

direct taxes is extremely difficult and the major part of the government revenue comes from tariffs and taxes on intermediate inputs. Given the administrative and the political constraints on tax policy, public intervention in the financial market can be regarded as a second best alternative for attaining social goals. In many developing countries the equity objective has figured prominently in the formulation of administered interest rates and directed credit programmes. We propose however, to concentrate on only the scope for and limits to public intervention in the promotion of saving and allocative efficiency.

For most developing countries there is hardly any evidence that saving is positively related to the rate of interest [Dornbusch 1990]. When saving propensities differ across classes, especially between rentiers and entrepreneurs, the aggregate saving need not respond positively to interest rates. Thus consider the simple case where real wages are fixed, production is at the capacity level, and all (private) saving is undertaken by rentiers and entrepreneurs.[19] If the saving of the two classes are s_e and s_r respectively and $s_e < s_r$, the aggregate saving will fall with a rise in the rate of interest when s_e and s_r are not interest sensitive. The reason is that an increase in the interest rate shifts the distribution of income in favour of rentiers at the expense of entrepreneurs. Even when s_e and s_r are positively related to the interest rate, the saving schedule, as shown by SS in the figure, may be backward bending at high enough interest rates.[20]

The point to note here is that the market clearing interest rate r_m need not be the same as the saving maximising interest rate $\bar{r}$. This difference creates scope for raising the aggregate saving ratio through public intervention in the financial market. It is important however to distinguish between situations where (1) $r_m > \bar{r}$ and (2) $r_m < \bar{r}$. The two situations are represented in the figure by A_1 and A_2 respectively. If the monetary authorities fix the interest rate at $\bar{r}$, the aggregate saving ratio is raised in both cases. But in the second case (where $r_m = r_{m2}$)the higher saving potential could be realised only if investors are provided with a subsidy at the rate BD_2. Given the saving-investment gap at $\bar{r}$, seniorage may appear as an attractive means of financing the subsidy. However, when investment is of a long-term nature, such subsidy endangers fiscal viability unless the draft on the exchequer can be neutralised over time by taxes from the growth in income due to additional investment.

For an economy operating under a severe fiscal constraint the scope for public intervention in the financial market is much wider when at the free market equilibrium configuration (A_1) the saving curve is backward bending. Fixation of interest rate at $\bar{r}$ will then raise realised investment and saving. However, the loan market is then characterised by rationing and there will be a tendency for misallocation of investible resources. The objective of raising saving with no loss of allocative efficiency can be attained if the government imposes a tax on interest at the rate BD_1. Indeed, such a tax involves a transfer of income from enterprises to the government and raises the maximum potential saving of the economy beyond what is shown by SS (provided the government uses the proceeds from the interest tax for financing investment).

Government Borrowing from Commercial Banks

Governments in almost all developing countries take recourse to substantial borrowing from commercial banks at fairly low rates of interest.[21] Such borrowings violate the principle of allocative efficiency since the return on the public sector projects financed thereby may be lower than that on private investment. In the absence of externality there is no reason for any special dispensation for public sector enterprises. In a fiscally constrained economy the government may still borrow at a low rate of interest, but should lend out the fund at the 'market clearing rate'. This will serve the twin objectives of saving and allocative efficiency.

Again, an improvement in the overall productivity of resources requires a balance between public investment in health, education and physical infrastructure on the one hand and investment in industry and agriculture on the other hand. The problem with most infrastructural investments is however, that in spite of their high social returns, governments in developing countries find it difficult to realise enough revenue (either directly from the beneficiaries or indirectly through taxes from additional income) for servicing the debt incurred for such investments. Appropriation of bank credit by the government may be regarded as a second best solution to the problem of financing infrastructural investment in a fiscally constrained economy. Low interest rates on government borrowing constitute no doubt a tax on the private sector; but the overall saving in the economy will rise when the reduction in the interest cost to the government results in an equivalent increase in public investment. Again, the increase in private income (in the form of additional profits, wages and interest) due to infrastructural investment would more than neutralise the implicit tax due to low interest on government borrowing.

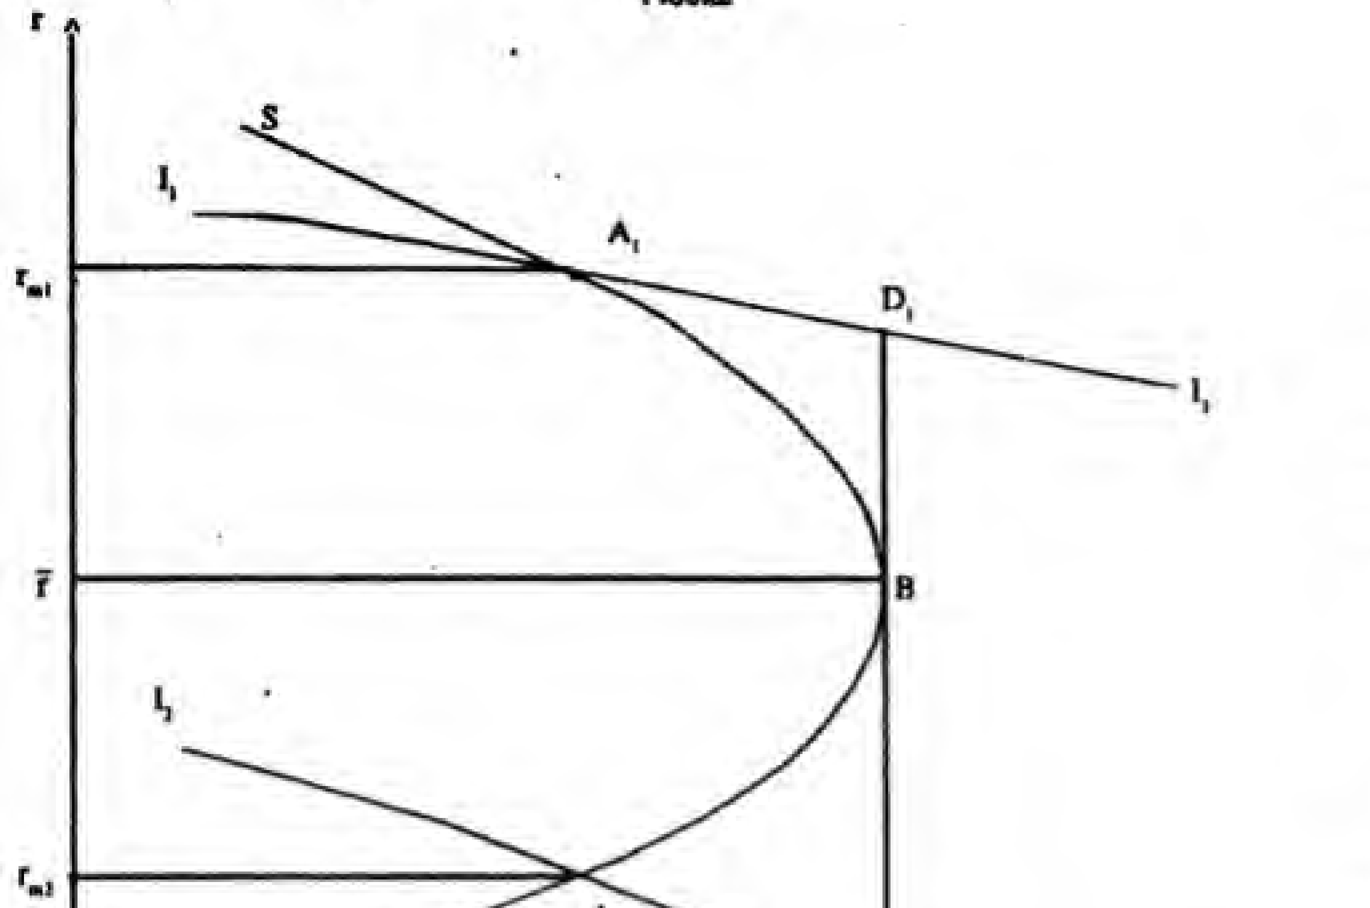
Interest Rate Mechanism and Allocative Efficiency

We have assumed so far that except in the case of infrastructural investment, the interest rate mechanism can be relied upon for optimum allocation of credit among investors. The assumption does not hold when banks operate (as they generally do) in a highly imperfect credit market. Even if perfect competition prevails everywhere, financial markets are very often characterised by credit rationing and bank credit does not necessarily finance investment projects yielding the highest return [Stiglitz and Weiss 1981; Cho 1986; and McKinnon 1988]. The reason lies in (a) the difficulty for banks in distinguishing between safe and risky borrowers;[22] and (b) the divergence between the expected return to investors and expected return to banks[23] [Stiglitz and Weiss 1981]. Thus even when private and social returns on investment are identical, market forces need not lead to optimum allocation of credit.

The extent of misallocation tends to be more serious when market prices of factors and products differ from their shadow prices. The first best solution to the problem lies in a system of appropriate taxes and subsidies. When such a system is difficult to implement, the next best alternative often consists in administered interest rates with directed credit programmes. Consider for example the problem of raising the production of foodgrains and keeping food prices at a low level in order to extend employment opportunities, reduce the incidence of poverty and contain inflationary pressure.[24] Under the free play of market forces there will be some flow of credit to agriculture when attempts are made to implement employment generation or poverty alleviation programmes, or to raise production and investment in non-agricultural sectors. But agricultural credit will still be inadequate to provide the necessary boost to output for containing inflation and hardship of the workers not covered by these programmes. The alternative of subsidy on food through the public distribution system is generally costly to administer and creates serious budgetary problems. The reason is that forced procurement of foodgrains at low prices in ruled out since (apart from political considerations) the policy will have an adverse impact on production and private investment in agriculture.

Cross subsidisation of credit to farmers may constitute a feasible device for resolving the dilemma in a fiscally constrained economy. Note that such subsidies are called for not only on grounds of equity but also since growth (with macro-economic stability) requires relaxation of the 'food constraint'. Public intervention in the sphere of agricultural credit is also justified by the difference in 'risk' to an individual banker and to the economy. When the government is committed to a policy of macro-economic management, the variance of the expected return on a bank's portfolio held in the form of loans to, and (financial) investments in, various industries approximates that on the expected return on aggregate investment in industries. However, with sharp differences in soil and climatic conditions across regions, the variance of the expected return in agriculture in a particular area will be much higher than that for the entire economy. The result is suboptimal allocation of credit to

Figure



agriculture since either the operation of individual banks is confined to a region, or decisions in respect of credit are decentralised and left to local managers of large banks. The remedy in such cases lies in directed credit programmes or setting targets for bank credit to agriculture (as a ratio of total credit or deposit).

More generally, the interdependence of returns on investment projects makes the interest rate mechanism inefficient in governing inter-sector allocation of investible resources. In the absence of information regarding current *and* future investment at the aggregative and sectoral levels, the expected return of an investor may be wide off the mark. Such interdependence also implies that in the absence of some co-ordination of investment decisions there can be underinvestment in some and overinvestment in other industries. Such misallocation will be extremely costly since investment projects are generally lumpy and irreversible (in the absence of Edwardian recontracting or the Walrasian auctioneer). Again, with strong complementarity in investment decisions there can be multiple equilibrium under a flexible interest regime. All of these equilibrium outcomes will not be efficient and state intervention is required for co-ordinating investment projects and attaining the optimum allocation of funds. It is for these reasons that countries like South Korea continue to rely on directed credit programmes though government controls have been abolished in other spheres of the economy.

Macro-Economic Management under Financial Liberalisation

Finally for the problem of macro-economic management under alternative financial systems. When interest rates are completely flexible, banks and non-bank financial intermediaries are permitted to mushroom and quantitative controls over credit are ruled out, the problem of macro-economic management tends to assume serious proportions. Under most programmes of financial liberalisation the cash reserve ratio is permitted to vary within fairly narrow limits. Again, it is only after banks have reduced significantly their holding of government securities and a large bill market has been developed can the central bank take recourse to open market operations on a large scale without undermining the financial viability of the banking system. However, even when the central bank can use all the traditional instruments for controlling the supply of money, the fine tuning and the extent of information relating to behavioural and structural parameters required for successful macro-economic management would generally be beyond the monetary authorities of any developing country. It is for this reason that the central banks need to have some blunt instruments, e g, credit ceilings or quantitative restrictions on credit to traders in sensitive commodities, the macro-economic efficacy of which may outweigh their disadvantages on other grounds.

IV
Conclusions

Our analysis focuses on the importance of the development of financial infrastructure not so much on distributional considerations, but primarily for improvement in allocative efficiency and raising the rates of capacity utilisation and saving. Under the free play of market forces investment in banking will be suboptimal due to the wide gap between the social and the private returns on the extension of banking services to unorganised enterprises. The gap between the two returns will be wider, the larger the endowment of resources in the informal sector; the more the resources are area specific or immobile; the greater the imperfections in the markets for factors and products; and the more important the impact of credit extended by a bank on the deposit mobilisation of or demand for credit from other banks. Under the canonical form of financial liberalisation inadequate banking facilities to producers in the unorganised sector will thus act as a serious constraint on economic growth.

While framing the investment policy regarding financial infrastructure, a few general considerations need to be borne in mind. First, fiscal constraints under which governments in third world countries operate rule out large subsidy as a feasible means of inducing the desired investment, unless the additional tax revenue from increased production is sufficiently high. Second, an individual bank has to operate on a fairly large scale in order to exploit the economies of scale, reduce risk and internalise some of the externalities mentioned above. Third, for promotion of competition and efficiency private and public banks should function under the same set of rules, including those relating to subsidy. Given these considerations, all commercial banks may be required to maintain some balance between their scale of operations in the organised and unorganised sectors. The implication is that an individual bank is forced to cross-subsidise its investment catering to producers in the unorganised sector. However, this need not cause an erosion of bank earnings, since the co-ordination of investment in banking enforced by the authorities raises the total profit accruing to all banks. Such a policy of cross subsidisation may be supplemented by direct subsidy for opening branches in areas which deserve special treatment on grounds of regional balance or of extraordinary disparity between social and private returns.

While the case for public intervention is quite open and shut in respect of investment in financial infrastructure, regulation of interest rates and some form of directed credit programmes or quantitative controls over credit are also often required for stimulating saving, improving allocative efficiency and effecting macro-economic stabilisation. When the tax machinery is

ineffective and saving propensities of entrepreneurs are much higher than that of rentiers, a policy of fixing interest rates on bank credit can promote both the objectives of saving and allocative efficiency. Again, cheap credit for financing public sector investment in health, education and physical infrastructure is essential in a fiscally constrained economy. In fact, the case is at par with subsidy on investment with large positive externality except that here it is the banks (rather than the government) that are required to incur the cost of subsidy. This, to be sure, is not an ideal solution, but perhaps the best among feasible alternatives before governments in developing countries. More generally, even from the viewpoint of efficiency it is necessary to set some overall targets regarding the sectoral allocation of investment. The reason lies in the irreversibility and interdependence (both sectoral and intertemporal) of investment decisions which make their co-ordination through the market extremely difficult and costly. However, in order to avoid the deleterious impact of quantitative controls, bankers may be left free to vary interest rates so long as they fulfil sectoral targets. Alternatively, monetary authorities may fix differential interest rates at which the demand for credit is close to targets corresponding to the optimum allocation of investment.

To sum up, state intervention appears essential for the development of an efficient financial infrastructure. So far as allocation of credit under the given financial system is concerned, it is necessary to rely on some form of indicative planning and regulation of interest rates in order to promote saving and correct for market distortions and externalities, especially in a fiscally constrained economy. For effective macro-economic management central banks in developing countries also often need to use crude instruments like credit ceilings. However, for promotion of efficiency in the financial system and in the intra-sector allocation of investment, quantitative controls should be backed up by adjustments in the structure of interest rates to make the demand for credit in different sectors close to their target levels.

Notes

[Revised version of a lecture delivered at the Centre for Development Planning, Erasmus University, Rotterdam, on the occasion of the Silver Jubilee of the Centre. The paper will be included in a volume to commemorate the Silver Jubilee.]

1 Due to the switching of funds from kerb markets to bank deposits only a part of which can be lent out under the fractional reserve system.

2 Under such an outcome excess of the interest rate in the kerb market over the nominal return on bank deposits is at the margin exactly offset by the relative advantage bank deposits confer in terms of liquidity or other conveniences. Any departure from such an interest differential would, by the neoclassical logic, be welfare diminishing.

3 Except the government.

4 In an open economy the demand deficiency may be met through an expansion of export balanced through an import of gold or silver (as in the case of India). But this also implies a leakage of investible resources of the economy. Indeed, from the macro-economic viewpoint it was the import of bullion which has constituted the major 'drain' on the Indian economy both in the colonial and post-colonial days.

5 Keynes (1936) defines full employment in terms of zero effective-demand elasticity of output and employment.

6 Even the creditors' savings are long-term, given the limited number of borrowers whom they serve, their dominant concern will be the riskiness of, rather than the expected return on, investment projects.

7 While investment as a ratio of output in the unorganised sector tends to be low, growth in the organised sector itself may be constrained by the slow growth of agriculture. Further, without some state intervention, financial infrastructure may not grow automatically to serve new industries and enterprises in the formal sector.

8 An increase in per capita income raises both the tax-gap ratio and the private saving ratio. We are assuming that saving ratio of the government is higher than that in the private sector.

9 It is of some importance to note that when scarce resources are withdrawn from some industries, such withdrawal makes possible an increase in the employment of idle human and non-human resources in the informal sector.

10 We ignore the gains accruing to consumers due to liquidity and safety of bank deposits—gains reflected (*a la* the neoclassical logic) in the interest differential between the return on other assets and the interest on bank deposits.

11 And the government undertakes appropriate macro-economic management.

12 Recall our assumption that the initial situation is one where it is not possible to raise productive employment without an expansion of the banking system.

13 Even when banks have full knowledge of the potential profits of their customers, it is difficult to practise price (interest) discrimination of the first degree or set different loan packages (specifying both the interest rate and the quantity of credit) for different customers on a take-it-or-leave-it basis.

14 For example, accumulated savings held in the form of bank deposits, or loans from close acquaintances.

15 The reason is that the project would not have been undertaken in the absence of the new bank.

16 It is the borrowers and not so much the savers in the unorganised sector who are deprived of services provided by banks. Note that this implies a transfer of resources from the unorganised to the organised sector even when such transfers violate the principle of allocative efficiency.

17 The additional investment in the organised sector is possible either because of the relaxation of the 'wage goods constraint' or since the government no longer finds it necessary (in the context of the rise in investment demand) to stimulate consumption for 'full employment' of resources.

18 Suitably modified for externalities or market imperfections.

19 Banks are included among enterprises.

20 At highly interest rates, $\delta s_e/d_r$ and $\delta s/\delta_r$ are likely to be lower. Negative slope of SS at high interest rates is ensured when s_e and s_r quickly approach their maximum (or asymptotic) values with increases in the rate of interest.

21 Until recently commercial banks in India were required to hold 38.5 per cent of their deposits in the form of excess reserves or unencumbered government securities (yielding low returns).

22 At high interest rates safe borrowers drop out and bank loans will be used to finance relatively risky projects.

23 When an investment project is successful, banks get back their principal with interest. But when the project fails banks may be able to realise only the salvage value of the asset.

24 In most developing countries availability of food limits the scope for undertaking large-scale labour-intensive investment projects, and the behaviour of food prices constitutes the single most important factor governing inflation and the incidence of poverty.

Imagining a Hindu Nation

Hindu and Muslim in Bankimchandra's Later Writings

Tanika Sarkar

The author explores the location of the Muslim and the Hindu nation in Bankimchandra's works as an interlinked formation that has to be situated simultaneously within his novelistic and his discursive prose. The two set up an internal dialogue and self-interrogation that moved across his earlier, relatively open-ended and often radical phase and later more dogmatic and recognisably revivalist work. The paper is centrally concerned with the profound breaks in thinking and expression as well as with the fundamental continuities that were preserved through certain narrative tropes and devices by which Bankim continued to destabilise his seemingly unambiguous agenda of a triumphalist Hindu people.

The focus is on Bankim's last five years when he composed three historical novels on Hindu-Muslim antagonism and two polemical essays on an authentic and reinvigorated Hinduism to be attained through a disciplinary regime that Bankim spelt out in some detail.

I

BANKIMCHANDRA CHATTOPADHYAYA (1838-1894) was the real founder of the Bengali novel as well as of serious discursive literature on political theory. He took the infant prose to new heights and wrote originally and acutely on world religions, on class and gender relations in Bengal, on the history of nations and on the absence of both history and nationhood in Hindu traditions. He was also a brilliant humorist and satirist who laughed at most traditions, agendas and social types. Generally regarded as the most powerful formative influence on 19th century political thinking in Bengal, he is a difficult author to read with any absolute certainty since he seems to straddle very different positions with equal felicity at different times;[1] and also because he seems to mock at convictions and resolutions that he himself had constructed.[2]

Scholars generally regard Bankim as a crucial force in the making of both a nationalist imagination and a Hindu revivalist polemic. A particularly striking instance of this dual impact is his celebrated hymn to the Motherland—'Bande Mataram' (salutation to the Mother),[3] which became the most potent patriotic slogan at peak points in 20th century mass nationalist struggles[4] as well as the Hindu rallying cry in moments of Hindu Muslim violence.[5] The dual use has its dangers. Nationalism, which many influential scholars tend to treat as a non-historicised, undifferentiated monolithic category, may be read, rather too easily and quickly, as a variant of Hindu communalism and vice versa, both composing a hard and a soft face of the same phenomenon and both produced by western epistemic and ontological operations.[6] Elsewhere, Bankim's work has been split up into different components which are isolated from one another and his concept of Hindu nationhood is then read on its own as an exercise in nationalist imagining without any reference to the Muslim in the discourse.[7] Finally, Bankim's polemical references to the Muslim are sometimes detached from his novels. They can then be seen as a seamless whole, without internal shifts. The communal impulse is then related to his nationalism as its displaced and disfigured form.[8]

I would like to explore the location of the Muslim and of the Hindu nation in Bankim's works as an interlinked formation that has to be situated simultaneously within his novelistic and his discursive prose. The two set up an internal dialogue and self-interrogation that moved across his earlier, relatively open ended and often radical phase[9] and later, more dogmatic and recognisably revivalist work. I would be centrally concerned with the profound breaks in thinking and expression as well as with the fundamental continuities that were preserved through certain narrative tropes and devices, through which, I believe, Bankim continued to destabilise his seemingly unambiguous agenda of a triumphalist Hindu people. My focus will be on his last five years when he composed three historical novels on Hindu-Muslim antagonism; and two polemical essays on an authentic and reinvigorated Hinduism which needs to be attained through a disciplinary regimen that Bankim spelt out in some detail.[10]

In sharp contrast to his prolific earlier production, Bankim wrote much less in this period. There is little use of satire, caricature or humour. For the first time in his life, his prose remains uncompromisingly solemn, weighty and ponderous, all of which, at least overtly, seems to embody a single and authoritarian polemical thrust rather than an argument that continuously poses new questions and issues to itself. One of the essays, in fact, is written in the form of a guru preaching to his disciple.[11] The authorial voice is intrusive and cast as that of a self-proclaimed proselytiser-cum-pedagogue.

It is this phase that is considered to be a decisive component of Hindu revivalism. And Hindu revivalistic concerns and arguments had, in their turn, been a vital political resource for the contemporary Hindutva phenomenon and its Rashtriya Swayam Sevak Sangh leadership. I prefer to treat this phase of Bankim more as constituting the link between 19th century Hindu revivalism in Bengal whose Hindu supremacist agenda was not primarily turned against the Muslim or Islam; and the hard, aggressive Hindutva politics that started organising itself from the 1920s on an exclusively and explicitly anti-Muslim platform.[12] Apart from this role within the ideological lineage of aggressive Hindutva, Bankim has a more direct imaginative bearing on the RSS combine. His 'Bande Mataram' hymn is, for this combine, the authentic national anthem, a truer one than the 'Jana Gana Mana' of Rabindranath which is the accepted version for the Indian state. The hymn is daily sung in its entirety (including all the Bengali passages) at RSS and Rashtrasevika shakhas.[13] Any change or abbreviation is strictly forbidden since the song symbolises the undivided, inviolate body of the pre-partition Motherland, and, hence, an abridgement amounts to a symbolic mutilation of the sacred body, a repetition of the partition. As soon as the Bharatiya Janata Party, the electoral front of the combine, came into power in Delhi after the state elections of 1993, it made the song compulsory in all state-run schools of Delhi. I would, however, be as concerned with what was not taken from Bankim's thinking on the Muslim and the Hindu nation as with what was taken; and also with how differently the themes were negotiated even when the broad conclusions seem to point in the same direction.

II

It is important to recall that till the end of the 1870s, Bankim had very boldly and thoroughly probed the specific forms of

caste, class and gender oppressions within pre-colonial Indian traditions. He had occasionally questioned the need for self-rule and nationhood for Hindus, given these internal and structured power relations, which might even be loosened up some-what under foreign rule.[14] In *Samya* (Equality), which was published in 1879, he moved well beyond the modest confines of the notion of companionate marriage that the liberal reformers would advocate for the new, educated woman. He also made startling suggestions about her future economic independence and about sharing of housework between the sexes. He questioned the supreme emphasis that reformers, revivalists and the colonial state equally placed upon the absolute chastity of the Hindu wife who was situated within a framework of male polygamy.[15] He saw caste, class and gender hierarchies as interlinked facets of a system that embodied the most absolute form of inequality anywhere in the world.[16]

Even in *Samya*, however, certain kinds of freedom and oppression are dealt with in a rather cursory manner. British rule and the notion of progress had been questioned in relation to peasant poverty,[17] but the entire question of foreign rule and political freedom had been rendered a lesser priority by couterposing to it the issue of internal stratification and oppression within Indian society. The peasant, moreover, is the object of enlightened social engineering but political initiative is obviously beyond him. In his historical novels, too, political change is invariably initiated by kings and ascetics; when the ordinary folk initiate direct action, it degenerates into mob rioting.[18] Demands for freedom and welfare for victims of social oppression are powerfully articulated but the agenda is left without an agent.[19] It is the colonial state which, after all, is asked to assume a corrective role.

In the 70s, when Bankim was writing his socially aware and courageous prose, the absolute vulnerability of all categories of tenants on issues of rent increase, illegal cesses and the arbitrary powers of eviction that the landlord enjoyed had hardly been breached.[20] From 1880 onwards, however, plans for substantive amendments in tenancy laws had been set afoot[21] and the state, moreover, was systematically compiling and classifying information about low castes, with a view to intervening in improvement measures in the near future. This was in the context of rethinking in official policies about social groups after 1857, when there was a marked suspicion about upper castes in general among government officers. Bankim was, in fact, selected by H H Risley in 1881 to assist in the preparation of an Ethnographic Glossary with detailed research on castes and tribes for the district of Howrah where he was then posted.[22] It also became increasingly difficult to regard peasants the way Bankim had portrayed them—as passive victims. Since the mid-70s powerful forms of peasant self-organisation and movement against arbitrary landlord exactions had become a central feature of the agrarian scene. The spread of the commercial cultivation of jute, moreover, benefited the small peasants of Muslim or low caste categories rather than the rentier groups who constituted the base of the new middle class.[23] Moreover, the failure of Bengali entrepreneurship to find space for itself in the higher rungs of trade, business and industries was definitively established by the 70s.[24] There was a keen sense of exclusion from the commanding heights of the civil society for Bankim's own class. His earlier critique of the oppressive privileges of a parasitic upper caste-middle class now seemed to require a further deepening of these processes of exclusion, leading, conceivably to a partial reversal of power relations rather than the benevolent and responsible paternalism of upper caste landowners that Bankim had prescribed in the 70s. There was now a real problem of choice.

After the late 70s Bankim would never return to the themes of peasant poverty and caste oppression. He would repudiate *Samya* and refuse to bring out a new edition.[25] Even without necessarily imputing narrow motives to this choice, we have to reckon with this absence and the implications this holds out for a possible radical social agenda at a time of limited but real social change. We have to recognise that the choice was made and exercised through a silence, through certain excisions from his earlier concerns. It is also a fact of considerable significance that the definitive transition from a predominantly liberal to a markedly Hindu revivalist discourse was made within Bengal around the same time and against this context. Sumit Sarkar has already pointed out a somewhat similar predicament in the 1920s that partly enabled a turn towards organised communalism.[26]

The posing of the problem of power and exploitation was, therefore, unambiguously radical but Bankim's radical imagining failed or refused to construct a resolution that could be adequate to itself. If the peasant or the dispossessed low caste was not to be the subject of his own history, then the immediately realisable and convincing agency for self-improvement within Indian society—an agency that, moreover, already seemed activated—could be the middle class with its western education, liberal values and a reformist agenda. If reform of Hindu patriarchy was the major concern for this group, Bankim, too, had his own critique of Hindu domestic norms which, if anything, was far sharper than that of the reformists. Bankim, however, was relentlessly critical of its aspirations and methods of work. He saw its dependence on colonial legislation for initiating improved family laws as a basic moral flaw since this neither generated a will for change within wider society, without which reform would be doomed, nor did it make 'men' of modern Hindus by vesting them with independence of effort and hegemonistic capabilities. Any dependence on foreign rulers perpetuated and exemplified for him, the lack of a will to freedom and nationhood which had kept Hindus subjected for centuries. Bankim spared no effort at mocking this dependence on alien legislation[27] as well as the emasculation it produced. He also mocked the surrender of the new middle class to Orientalist forms of knowledge on India, although he retained great respect for strands within mainstream western social and political philosophies.[28]

Since he saw it as a class that was born retarded, Bankim refused the middle class its demands for political freedom and rights. He made himself extremely unpopular by supporting British moves to muzzle the vernacular press to suggest that it was behaving irresponsibly and that it needed controls.[29] He used the entire and formidable resources of his satire and caricature to make fun of the politics of associations and organisations, of the mimicry of imported political models that was involved in such exercises and the ridiculous misadventures in handling them.[30] He, therefore, undercut precisely the struggle for democratic and public spaces where Indians could grow through debates and experiences of organisation and protest. Neither a radical nor a liberal form of democracy was compatible with the heroic agenda that held his imagination. In fact, if Bankim prefigures the trajectory of some features of Hindutva, he also powerfully embodies some aspects of a far softer and pluralistic form of liberal indigenism. The latter, out of its commitment to a non-'alienated' authentic politics, and its suspicion of liberal rights or radical social protest that derive some of their terms from the post-Enlightenment political radicalism and democratic traditions, finds itself in the same space as aggressive, intolerant Hindutva in its critique of secular democratic politics. This, in the final analysis, emerges as a far more consistent and powerful strain than its critique of Hindutva which is sporadic and milder.[31]

The thrust towards a pure and authentically Hindu site for generating the social will for change complicated his social concern, his sharp criticism of the traditional, pre-colonial form of Hindu domesticity and his daring imagining of the non-domesticated, strong, passionate woman that had earlier created a marked distance between him and the contemporary Hindu revivalist-nationalist.[32] While he grew intellectually through a

Enlightenment universalism and Hindu philosophical resources and used the resources of both to interrogate both—and here lies the ineptness of the notion of hybridity that misses out on the criticality and the mutually transformative nature of this intellectual encounter—the compulsion to opt for a pure site of exclusively Hindu knowledge triumphed after his exchanges with Reverend Hastie.[33]

In 1882, Reverend Hastie of the General Assembly wrote a tract that was brutally critical of Hinduism. Bankim, who had always ridiculed Orientalist pretensions about scientific knowledge on India, prepared a long, careful and angry reply. It was after this that he repudiated *Samya* and, in his discursive prose, became exclusively preoccupied with the theme of a reconstructed Hindu form of knowledge and leadership. The anger was probably fuelled by the changing political environment since the mid- and late-70s. The post-Mutiny repression, clearly racist in nature, had initiated serious self doubt among the Bengali middle class that had been entirely loyal in 1857. The escalation in discriminatory colonial policies during Lytton's era[34] was followed by the violent racist backlash at the time of the Ilbert Bill agitation. Apart from the exposure to the most extreme and naked form of white racism in a concentrated dose, the middle class was also troubled by a reversal of trends that had promised a milder climate at the time of Northbrooke's, and later, of Ripon's liberal policies[35] which were on the point of opening up a few minor but real opportunities of incorporation within the colonial decision-making process.[36] This led to an intensification of both liberal and Hindu revivalist forms of anti-colonial critiques and organisation. Liberal nationalists formed secular, open organisations for self strengthening and formulated economic critiques of the colonial drain of wealth, Indian poverty and deindustrialisation that remained the foundational concepts for all nationalist economic thinking down to Gandhi.[37] Hindu revivalists, on the other hand, used their anti-western rhetoric to close off all interrogation and transformation of power relations within the Hindu community as false knowledge contaminated by alien forms of power knowledge.[38] It thus assumed a markedly fundamentalist kind of defensiveness. Faced with this crisis of conscience, Bankim reacted by repudiating *Samya* and by excising the frontal contestation of Hindu caste, class and gender hierarchies from his prose. The excision, despite his best efforts, remained somewhat incomplete and Bankim reinserted some of his earlier critiques insidiously in his later novels.[39]

Historical developments as well as certain earlier political choices, then, blocked off, for Bankim any ... liberal reformers as a vehicle for Hindu self-improvement. As class, caste and gender abruptly disappear in his work as central concerns, their absence is filled up in the 80s by a new and coherent problematic: What constitutes authentic Hinduism, what possibilities exist within Hinduism of the past and in the re-authenticated Hinduism of the future for nation building, what precisely was the culpability of the Muslim in Indian history and how and why had Hindu power capitulated to it. It is not that these problems were not reflected on in his earlier prose, but there they had locked horns with an equally powerful set of social concerns.[40] Their centrality now becomes absolute and uncontested. Bankim looks for an ethico religious site for the Hindu people whose dominant priority is not what is socially just but what is truly indigenous—i e, Hindu.[41]

With the reoriented problematic, the obvious agency could now be restored to the brahmanical forms of knowledge and upper caste social leadership. This, however, presents equally powerful problems. Bankim continues to believe that past traditions of Hinduism had not generated any impulse for freedom and nationhood. If, then, these new changes need to be improvised, then old forms of knowledge or rule will not automatically yield them. Even in this later discursive phase, he continued to polemicise against certain forms of Hindu knowledge and devotion, as earlier he had critically reviewed Sankhya and Nyaya traditions.[42] At no phase had he shown much sympathy for the Vedic-Vedantist philosophies, perhaps because their quietist, reflective modes were inappropriate for a politically militant, even violent heroic agenda, and also because these were resources that Brahmo reformers had celebrated.[43] He conducted a relentless polemic against the dominant Bengali form of devotion—Bhakti, especially its Vaishnav form which worshipped Krishna as a figure of great erotic excess.[44] He chose the Puranic tradition and put together from them the figure of a heroic, vindictive, wily and violent saviour figure. He used as his model mythical—epic dimensions of the later life of Krishna when he was no longer the shepherd boy or the great lover, but when he had grown up into the king, the politician, the warrior.[45] Throughout his life he held lively arguments with the orthodox repositories of brahmanical knowledge—the pandits of Bhatpara.[46] He cast doubt on the learning of the doyen of the Hindu orthodoxy of his times—Pandit Sasadhar Tarkachuramani.[47] The criticality and intellectual and polemical energies which continued to shape his writings even of the later period, would be something that contemporary Hindutva entirely eschews.

Even in the *Dharmatattva*, the g... to a well read, argumentative disciple. RSS pedagogic principles, on the other hand, are entirely exhortative and rhetorical, and internal debates and productive differences find no space there. It is not for nothing that they select recruits from very young children who lack the capacity to argue.[48]

The existing representatives of the old Hindu ruling groups—the upper caste landowners and rentiers who opposed the new western learning, the leaders of Hindu religious establishments, the pundits—failed to convince him as in any way deserving of their privileges or as offering potential for active leadership. In his later novels he returned to his sharp satirical bite in portraying the classic figure of the traditional Hindu patriarch—the upper caste parasitic landlord paterfamilias.[49] The virtuous founder of a Hindu power that he imagined in *Sitaram* could sustain neither his virtue nor his power.[50] Contemporary sexual and financial scandals about the Mohunt of the celebrated Shaivite pilgrimage centre at Tarakeswar that rocked Bengal in 1873[51] and the earlier scandal about the Maharaja of the Ballabhachari sect in Gujarat probably made him unable to imagine the present representatives of organised religion as saviours. Even the ascetics of *Anandamath*, the quintessentially militant patriotic novel, astonish the ordinary devout Hindu who keeps on asking them what kinds of Vaishnavs or sanyasis they are.[52]

It is notable that in this phase, as earlier, virtue, activism and heroism are more effortlessly embodied by the woman as almost a characterological trait.[53] Bankim had stopped polemicising against the subordination of women and the bold feminist of *Samya* had buried himself. In Krishnacharitra, in fact, he devoted much space to justify an act of force committed by Arjuna in abducting the sister of Krishna on his advice. Krishna convinces Arjuna, and Bankim tries to convince us, that male guardians can and should override the question of the woman's consent in the interests of her own larger welfare that they necessarily comprehend better.[54] The disproportionately large space that he devotes to justify this, rather minor incident in the life of Krishna, however, tells us how difficult he found it to persuade himself. In *Dharmatattva* he overturns his earlier images of conjugality as the equal and mature mutual passion between two adults that had deconstructed the revivalist nationalist celebration of non-consensual infant marriage between a polygamous male and an utterly monogamous child wife.[55] At the same time, even in the later phase, the woman remained the locus of the nation in a far more activist way than the passive, iconic role ascribed to her by revivalist nationalists who saw in her submission to Shastric

prescriptions and in her total insulation from new alien norms a measure of her symbolic capacity to embody and sustain the nation.[56] In Bankim, however, the only approximation of the figure of Saviour Krishna is the figure of the dacoit queen Prafulla who earns this capacity not by being faithful to Hindu domestic prescriptions but by surviving outside her household and by fighting against British forces. Even though the pedagogic training for the new Hindu that Bankim filled out in *Dharmatattva* is imparted to a male disciple, it is the dacoit queen of the novel who is shown to be actually undergoing the training.[57] In *Sitaram*, too, the woman causes virtuous action, the woman tries to save Hindu power and the woman is wrongfully tried and humiliated in a striking parallel with and an implicit critique of Ram's trial of Sita.[58]

The woman's activism, however, is occasional and exceptional even when it sustains some of the critical energies of the earlier Bankim. It is certainly not a sign of an investiture of the woman with leadership of the patriotic agenda. It is also something that happens entirely within his fiction. In the directly polemical prose, on the other hand, the critical energy is well contained, and even the feminine figuration of the Motherland that Bankim achieved in *Anandamath* is absent. The new Hindu is emphatically a Hindu man with a difference. He is the embodiment of a rigorous, disciplinary schedule that will eventually transpose discipline from an external ethico religious authority to the self monitoring ethical agent who has internalised reinterpreted concepts of Hindu knowledge and devotional practices (Bankim's explanation of Bhakti and Anushilandharma). It is the process of training which incorporates knowledge, dispositions, physical capabilities and devotion and which replaces privileges of birth and ritual expertise, that mark out the new brahmin who is the ideal patriot and nation builder from the old, unreformed Hindu authorities. Inherited and normative control are replaced with hard earned leadership and brahmanical authority is revived as intensively cultivated hegemonistic aspirations. A return on a higher plane, maybe, but a return, nonetheless. The imagined Hindu nation cannot, even in imagination, be made and ruled by agents that are not male and not upper caste.[59]

III

Let us now turn to some specific dimensions within the construction of the new Hindu. We shall begin with a theme that we touched on in the first section: the Bande Mataram hymn. We shall use it as an illustration of the imaginative and rhetorical devices with which a militant Hindu form of patriotism is constructed. Bankim had originally composed this as a song in 1875. Later, when he had finished the highly influential novel, *Anandamath*, he inserted it within the story and vested it with highly significant narrative functions.[60] The song, on its own, would have made an original move towards a deification and fetishisation of the country. That sense was further heightened by other resonances within the novel which spent much effort in constructing a sequentialised imagery of the deified Motherland.[61] Apart from that, the narrative framing, acquired from the novel's plot, endowed it with additional and very new properties. The hymn, subsequently, was detached from the novel and achieved a life of its own as a slogan in mass nationalist rallies, and later, in communal violence. The novel, however, remained contained within the slogan as implied resonances, associations and emotions and provide a reference point for larger messages.

The song begins in Sanskrit, then turns into Bengali and ends with Sanskrit passages again. It begins with an evocation of the bounteous, lovely land that generously nurtures its children. Then bounty and physical richness turn into an image of latent strength, derived from the image of Durga, the demon slaying goddess, from the numerical strength of the population, compiled from Census statistics, and from the supreme sacred significance that Bankim ascribes to her within the Hindu pantheon: "It is your image that we worship in all temples".[62] The land, for a while, is at one with the icon of Durga. The image of Durga then quickly and insidiously transforms itself into that of Kali, another manifestation of the Mother goddess, but as a destructive, angry force. It ends with a reiteration of the original sense of bounty and nurture, and an exhortation to her children to enrich her strength with their own. In between, there is just a suggestion of her present weakness—"with such strength, why are you helpless?"—but the overwhelming sense is one of power. The power is undifferentiated and flows back and forth from the mother to the sons, though it certainly originates with the mother. The song encapsulates, in an unbroken musical flow, the three distinct images of the nurturing mother of the past, the dispossessed mother of the present and the triumphant mother of the future that are developed at much greater length within the novel.[63] Later nationalists clearly saw the demon slayer as pitted against the colonial power and used the song as an abbreviated history of the growth of colonial exploitation and the patriotic struggle for liberation. The RSS, on the other hand, certainly took it to imply a 'historical' struggle against the Muslim, since from their inception, they had stayed away from the anti-colonial movements and had devoted themselves to an exclusively communal agenda. As a matter of fact, in the song itself, the demon is nonspecified and is eclipsed by the image of the armed Mother. What is of importance is the reiteration that the patriotic son is quintessentially a soldier at war.

The novel itself is ambiguous about whom the Mother is fighting. It is set in the transitional historical moment of the late 18th century, against the backdrop of the famine of 1770 and the armed combat by marauding ascetics of Naga Dasnami orders against the puppet Muslim Nawab and the indirect control of the British in Bengal.[64] Bankim makes no mention of the role of Muslim fakirs who also led plundering bands of starving people. Even though the sanyasis were from Saivite orders, here they are worshippers of Vishnu, with a brand of militant, war-like bhakti of their own. Leaders are recruited from Bengali, upper caste, landed origins and they have transformed themselves with devotional and rigorous physical and martial training, with the vocation of ascetic celibacy for the duration of the struggle, which is ment to restore Hindu rule. Even though they do accomplish the ouster of the puppet Nawab, they also are instrumental in ushering in direct and complete British dominion. A divine voice tells the supreme leader that this is providential since Hindus need apprenticeship in modern forms of power. The leader, however, remains disconsolate and unreconciled and considers the historical mission of santans—the ascetic leaders—aborted since one foreign ruler is exchanged for another. Nationalists took this bitterness as a call for struggle against the colonial power, while to the RSS brigade, the divine command would indicate sanction for staying away from the anti-colonial struggle, since the divine purpose is stated to be the elimination of Muslim power.

Within the novel, the song initiates a number of political breaks and innovations. It is meant to be a sacred chant or 'mantra'. Yet, chants are compulsorily composed in 'debbhasha' Sanskrit—the language of the gods—to which women and low castes do not have access. They are aslo enunciated within a prescribed ritual sequence, always in front of the deity and always by the brahman priest or the initiated brahmin male householder. The novel ascribes it to an act of worship. Yet it is first heard during the aftermath of a battle between the British-led troops of the Nawab and the Santans who lead a mob of villagers. The hymn, then, enters the emergent cultic order of a new form of Mother worship as a chant that is unconventionally detached from the sacred ritual sequence and that can also function as a song on its own, as congregational devotional music that is accessible to all in Vaishnavite gatherings. Yet, unlike those

occasions, it enters into public use at a moment of war, not of pietistic contemplation of the earthly sports of Krishna. Devotional music, loosened from its original chant form, sacralises a war through this transference of indicated use—and, simultaneously, the hymn/song, which is also a battle cry, transforms the congregation of devotees into the monolithic single body of a disciplined army; "Then, in a single, resounding voice, the thousands of santan soldiers... sang out to the rhythms of the canon—Bande Mataram".[65] If a Hindu community-for-itself is being visualised, then, from the moment of inception it is a people at war, unified by violence against a shared enemy. The ascetic figure of the Santan, who first pronounces the words and who initiates the act of worship, immediately merges into the figure of the military commander and strategist who leads the holy war.

There is, however, a crucial difference between the older figure of the priest and the new priest-cum-commander. Unlike the former, the commander raises the song but he no longer remains in custody of the sacred ritual or chant. Others—including the motley army of villagers of all castes—enter into the act of singing and the hymn now moves into the vernacular. And, along with this, a further transformation of purpose takes place. First, a chant, then successively a song and a command, the hymn now passes into a battle cry—and forms the first ever political slogan in the Bengali language. The commander emerges as the political leader, the organiser *par excellence*. The importance of the enterprise to aggressive Hindutva lies in its explicitly political violence that can express itself convincingly as a religious purpose. It is underlined in the novel when, inspired by santans, the mob begins to articulate an agenda that goes beyond simple loot. "Unless we throw these dirty bastards [that is, the Muslims] out, Hindus will be ruined...When shall we raze mosques down to the ground and erect Radhamadhav's temples in their place?"[66]

The imaginative resources of a violent political agenda are immensely enriched, however, precisely by the ability to simultaneously lay claim to gentle and peaceful images.[67] The song is held in place by a tension between contradictory impulses which constitute a delicately poised unity. The tension and the tense unity are effected at the level of both sound and meaning. The land is beautiful and the mother is smiling, tender and youthful. At the same time, she becomes the ruthless warrior, triumphing in battle. Her loveliness, her smiles and grace are evoked in lush, flowing, elongated, rich sound effects; 'shubhrajyotsnapulokita yamineem phullakusumitadrumadalashobhineem, suhasineem, sumadhurabhashineem, sukhadaam baradaam mataram' (to the mother whose nights are gorgeous with silvery moonlight, who is decked out with trees that bloom happily with flowers, whose smile is beautiful, whose words are bathed in sweetness, who is the giver of pleasure, of bliss...). The sensuousness of the soft, liquid syllables is abruptly replaced with a quicker, jagged rhythm, by an arrangement of harsh, strident, strong words; 'saptakotikantha kalakala ninadakarale, dwisaptakotirbhujairdhritakharakarabale... bahubaladharineem, namaami tarineem...' (seven million voices boom out words of doom, 14 million arms wield the sharp swords...we salute the saviour mother, possessor of many kinds of strength).[68] Classical rhetorical conventions matched sounds with moods. But Bankim went beyond them in the dramatic art of juxtaposition, of shocking and astonishing transitions within a brief and continuous space. The rhetorical charge and power of the Hindutva project are very often trivialised by assuming a simple transition from gentle quietism to violence. The song, which remains a powerful imaginative resource for the Hindutva project, complicates and widens the notion of a binary opposition between peaceful, traditional Hinduism and violent Hindutva. Bankim's militant bhakti let go of nothing and its language was supple and inventive enough to effect many movements between opposites.[69]

In the process, a great transgression takes place—of inserting the profane vernacular and a political, modern purpose into a sacred order of worship which violently transforms its original nature and purpose. The seemingly democratic extension of esoteric holy words to slogans and songs to be used by all, however, has its structured limits. The leader—mob distinction is carefully underlined in the way in which each military encounter turns into chaos unless it is carefully calibrated by ascetic leaders. The leaders, whether here, or in the later two novels, are carefully trained in leadership qualities through a pedagogical scheme that certainly is not available to or meant for the mass following, which joins up out of sheer starvation and mob instincts. It is true that the ascetic leaders give up caste codes in times of war, and recruit soldiers from all social strata. But along with celibacy and asceticism this is the last sacrifice that they must impose on themselves until the final victory is achieved. It is also described as the most difficult of sacrifices.[70] Presumably, with victory, the restoration of the normal order would absolve them of the pledge. The point, then, is not to overturn the social hierarchy, but to qualify it in times of war. Established leaders of Hindu society may thus renew and extend their control by coming closer to the ordinary folk and by actually leading them to victory in a violent war against a common enemy. The temporary, yet close intimacy that the liminal space of war offers would provide real and felt legitimacy for what had been mere custom and prescribed power. The comprehensive training with which leaders approach the work of organisation ensures that the continued exercise of power has a far more secure base.[71]

IV

We had used the hymn and its function within the novel as an entry point into the rhetorical operations and a structure of feelings with which Bankim proceeded to delineate the politics of the reconstructed Hindu. Since the old Hindu had suffered from the absence of a combination of physical prowess and desire for self rule, the new Hindu will only have arrived when he proves himself in a final battle that will overwhelmingly establish his superiority over the Muslim, who had, in the past, always defeated the Hindu.[72] Since the British have something to impart to the Hindu, Hindu empowerment, it seems, must unfold within an overarching colonial framework. It is the Muslim, the vanquisher of generations of past Hindus, who will be the great adversary of the new Hindu.[73]

The Muslim was to be the adversary for yet another reason. I would like to suggest that Bankim made a distinction between the historical experience of Muslim rule on the one hand and Islam as an organised religion and the Muslim as a personality type on the other. Muslim rule, he considered, brought neither material nor spiritual improvement to India, and merely emasculated defeated Hindus. Yet, Islam, and the Muslim with his supposedly violent commitment to his religion and his desire for power, had much to teach to the Hindu.[74]

In his polemic on world religions, Bankim seemed to grant a perfection to Hinduism only in historical times, whereas, through a series of oblique half statements, Islam is endowed with perfection in historical times. If universal love is taken to be the highest human ideal, then, says Bankim, Hinduism has it in the largest degree. Yet, throughout history, that has led to a dangerous quietism, to an inadequate comprehension of national dangers, to subjection and to degeneration of the community. As far as Islam and Christianity are concerned, they have both avoided that particular problem. Between the two, however, Islam went far ahead of Christianity in attaining greater unity within its own boundaries and emerged as a more successful political model. By combining the different sets of values, we can construct a single uniform scale, wherein Islam transcends the particular problems of both Christianity and Hinduism even though, Hinduism and Islam are not directly compared with each other.[75]

In a crucial and conclusive part of *Dharmatattva*, Islam is dropped from the explicit comparative scheme and there is a new triangular contest for virtues among Hinduism, Buddhism and Christianity. "If Jesus or Sakya Singha had been householders and yet leaders of world religions, then their systems would have been more complete. Krishna as ideal man is a householder. Jesus or Sakya Singha are not ideal men".[76] If Hinduism scores over the two other religions on this ground, then there is also a third, unmentioned presence, another leader of a world religion who, too, was a householder and who yet transcended his mundane ties—that is Mohammad. Islam, or rather, the figure of the Prophet, is the sunken middle term in the diagram. If he implicity shares the honour of having founded a perfected religion with Krishna, he has the further advantage of being so within the accepted hagiography of Islam, and in the universally acknowledged version of Islam as well.[77] Bankim was, however, painfully aware that his ideal type Krishna was an appropriation and construction solely of his own heroic intellectual efforts, and that here he was going against the grain of dominant Hindu interpretative schemes.[78] Bankim's Krishna is a householder-king, a warrior, a politician. He is overwhelmingly a man of action, strong enough to be wily in a higher cause, to resort to seemingly amoral strategies for the higher good of his people. He is entirely unlike the morally pure of philosophically questioning Christ or Buddha. He is equally unlike the figure of total love and play that is celebrated in Vaishnavite hagiography. Of all the world religions that Bankim knew about, his Krishna stands as the closest approximation to Mohammad. In fact, the silent influence on Bankim's construction is so exact in particular features as well as in the total conception, that one may even be tempted to speculate if Bankim's Krishna is not, indeed, modelled on the biography of Mohammad.[79]

If the discursive prose of later years obliquely draws upon what Bankim regarded as the enviable resources and energies of Islam, and if he did not engage in sustained polemic against Islam in his essays on religion, he certainly evolved a mode of extremely denunciatory speech about Muslim rule in India in his novels. While his notions of ideal Hinduism informed 19th century Hindu revivalism, the particular language that he, more than any other contemporary, developed to describe the Muslim, certainly inflected the rhetoric and the aspirations of violent Hindu communalism of the next century.

Bankim bestowed on the Muslim an unprecedented centrality in his historical and political scheme, thereby starting a tradition. The revivalist climate of the times was shaped far more decisively by anti-reformist and anti-missionary propaganda and there were even a few clashes with missionaries in the early 90s.[80] During the Age of Consent Bill agitation of the 80s and early 90s, Muslims were written about as fellow sufferers and victims of colonialism.[81] The nationalist vernacular press usually took care to distinguish between the integrated, indigenised nature of "Muslim rule" and what they described as the entirely alien nature of the colonial government.[82] This is not to say that Bengal was completely immune from the communal violence that was sweeping across parts of northern India in the 1890s.[83] Muslims had recently gained a few educational concessions. Hunter's thesis on Muslim backwardness promised more, and with Muslim self-modernisation moves of the Aligarh variety, the possibility of sharpened competition in the sphere of the new education and jobs, where Bengali Hindus had so far enjoyed a decisive edge, seemed imminent.[84] So far, however, that remained a rather marginal worry and Hindu revivalism had not yet targeted the Muslim as the main enemy.[85]

Bankim bequeathed a set of historical judgments on the nature and consequences of Muslim rule in Bengal: "How does our Muslim ruler protect us? We have lost our religion, our caste, our honour and family name, and now we are about to lose our very lives...How can Hinduism survive unless we derive out these dissolute swine?"[86] These ideological moves do not need proper historical authentication since they are posed in a fictional space: the pseudo historical comments, however, carry an immense weight of conviction, nonetheless, particularly since Bankim was known for a highly historicist thrust in his discursive prose. They are, therefore, insidiously authenticated and then they justify political rallying cries of extreme virulence: "Kill the low Muslims"[87] is the refrain that is repetitively raised in *Anandamath*. Even though Bankim never made use of the recent theories of the colonial drain of wealth, he used the same motif to describe the flight of money from Bengal to Delhi in the form of a heavy revenue burden in Mughal times.[88]

Perhaps the most significant way in which Bankim served as a bridge between 19th century Hindu revivalism and the later, anti-Muslim, violent politics was by providing an immensely powerful visual image of communal violence and by giving it the status of an apocalyptic holy war. He stamped the image indelibly on the imagination of communal politics by fusing the impulse of community violence and revenge with the spectacle of a feminine body. In his last novel *Sitaram*, Gangaram, the brother of the heroine Shree is unjustly charged and sentenced to execution by a tyrannical Muslim fakir and a Qazi. Unable to stop this mockery of justice, Shree goes to the place of execution where a big crowd, including many Hindus, had gathered to watch the event. In despair, Shree tries to rally them to save a fellow Hindu, to instil a sense of brotherhood and mutual responsibility by evoking the fact that a man of their

community is being killed by another community. Shree does not invoke the theme of justice, nor does she try to rally subjects against tyranny and misrule. Quite spontaneously, the words that rise to her mouth are words of community solidarity and violence. "Then Gangaram saw a goddess-like figure among the green leaves of the huge tree. Her feet resting on two branches, the right hand clutching a tender branch, the left hand swirling her sari, she was calling out: Kill, kill..." Her long, unbound tresses were dancing in the wind, her proud feet were swinging the branches up and down, up and down, as if Durga herself was dancing on the lion on the battlefield. Shree had no more shame left, no consciousness, no fear, no rest. She kept calling out—"Kill, kill the enemy...The enemy of the country, the enemy of Hindus, my enemy... kill, kill the enemy... That straining arm was such a lovely arm... such beauty in her swollen lips, her flaring nostrils, sweat drenched stray locks falling across a perspiring forehead. All the Hindus kept looking at her and then streaming towards the battlefield with 'glory to Mother Chandike' on their lips".

In an instant, Shree had transformed a scattering of Hindus who had no previous sense of mutual connectedness, into an army with a single violent purpose, into a community-for-itself that can be realised only through invocation of vengeance against another. It is as if, to imagine a community of Hindus, Bankim can only imagine a spectacle of violence, of war. That is the only passion that brings the community into being. But the spectacle of violence is derived from the image of a passionate feminine body which literally gives birth to the violence. If political passion is produced through a feminine agency, there is little doubt about the kind of image in which this passion is cast. The woman's body moving "up and down, up and down"... the "straining arms, the swollen lips, the flaring nostrils, the sweat drenched locks and the perspiring forehead"—all are well remembered classical conventions for describing the woman at the moment of sexual climax. The superimposition of the icons of Durga and of Chandika, the goddess of war, on this body provides a sacred frame that tightly controls yet obliquely heightens the flow of sexual energy from which the visual image derives its power. The beginnings of a violently communalised imagination may, then, have something to do with a kind of male fantasising that encompasses sexual passion and political violence in a single impulse of pleasure.

V

Yet the consequences of such imagination do not entirely exhaust the logic of Bankim's discourse on the Muslim. We have already seen that his serious discursive prose referred to Islam with respect. In his novels, too, Bankim had been writing about Hindus and Muslims, and their relations with one another, all his life. They are ranged side by side, against one another, in dramatic and tense encounters between man and man, man and woman, woman and woman, as communities, nations, armies, as loving, fighting, making peace, arguing, negotiating. If all the novels on this theme are taken to compose a single novel, and the arrangements between people of the two religions are relations between two composite individuals, then the obvious simile is that of a conjugal or wildly emotional, dangerously fluctuating sexual relationship that may simultaneously include great intimacy along with great violence. A far cry from the way white people encounter Indians in his novels which provide moments of sheer comicality,[39] here is invariably material for high drama or for tragedy.

In his first novel *Durgesh Nandini* there is a striving for an almost mechanical symmetry of virtues and vices on both sides. The aim is to establish a shared code of conduct, be it for the heroes, the heroines, the villains or the cowards. Neither are Hindus and Muslims two monolithically integrated peoples and political alliances and expediency cut across religious boundaries.[40] Interestingly, Bankim, who experimented boldly with rather transgressive possibilities in sexual relationships beyond Hindu domestic and conjugal prescriptions, found in the Muslim woman, unbounded by norms of being faithful to only one man in an entire lifetime, a productive ground for playing on utterly new registers of sexual morality and commitment.

From the third novel, *Mrinalini*, the possibility of a shared enterprise vanishes and the Muslim becomes the great historical adversary of the Hindu. Battles between individuals are now loaded with destiny for nations. In *Rajsingha*, the Muslim adversary is not just an adversary but a hated and dreaded enemy—no less a man than the fanatical Aurangzeb. "He was born to hate the Hindus, he found Hindu offences unpardonable..." There are references to all his well thumbed sins in the opening chapter itself—jeziya, temple wrecking, cow slaughter, forced conversion. This seems a typical case of stereotyping. Yet, let us remember the first appearance of the presumed enemy of Hindus. We meet an elderly man in white, quiet, dignified, assured, respecting strength in an enemy. All the characteristic historical associations had been revived and refamiliarised in the first chapter. Gradually, however, over the entire text, the stereotype is defamiliarised, redeemed and humanised, especially by Aurangzeb's gentle, melancholy love for a Hindu serving maid. It is no monster but a great adversary that had been defeated in the historical battle and herein lay the true glory of Mewar. Unlike the anonymous, faceless English troops, Muslim adversaries, even the worst of them, wear human faces where complex emotions are often delicately sketched in.

It is in Sitaram, the last novel, that the Muslim combatant is largely an abstraction, an absence; yet battles with him fill up the entire novelistic space. Has Bankim, then, at the end of his life, managed to formulate and congeal an agenda at the point of blind hatred, when the enemy sheds his human features and is reduced to a simple figure of hatred? I think that Bankim found it impossible to form and celebrate an agenda with sustained conviction even in his last, dogmatic, markedly authoritarian phase. If the agenda seems to be coherent and complete, he then proceeds to fracture it from within, to dissolve his own statement of conviction. Sitaram is defeated by his own inner flaws. The Hindu leader, whether a commander, a king, a brahmin or a patriarch, remains weak, treacherous, greedy and cowardly across historical and social differences. The most significant thing about the last novel, I think, is Sitaram's brutality against Hindu women—which is conventionally ascribed to the stereotypical Muslim. When Sitaram's Hindu kingdom breaks up, Hindu women celebrate the event with vindictive glee. An erstwhile tolerant Muslim fakir leaves his kingdom, vowing never to live under Hindu rule. The stereotyped notion of Muslim intolerance is turned upside down, for it is Sitaram who, by his own villainy, had forced this conclusion on him.

The novel, charged with shrill intensity, ends with uncharacteristic bathos. Bankim had never before used the device of a chorus composed of ordinary people. Here we find two common men, Ram and Shyam, having the last words.

"Ram: 'How goes it, brother? Have you heard any news about Mohammadpur? [Sitaram's kingdom].'

Shyam: 'Different people say different things. Some say the king (Sitaram) and the queen could not be captured... The wretched Muslims executed a false king and a false queen.'

Ram: '...That sounds like a Hindu fiction, a mere novel.'

Shyam: 'Well, who knows whose story is a fiction. Your story may well be a Muslim tale. Anyway, we are ordinary people, all this doesn't concern us. Let us enjoy a smoke in peace.'

Let Ramchand and Shyamchand enjoy their pipe of tobacco. We shall end our narrative at this point."

An uncharacteristic narrative closure for Bankim who had always been intensely concerned about historicity, with problems of political bias and partisanship vitiating

historical truth. All his familiar concerns are blown away with a few puffs of smoke, with rumours recounted by two ignorant and rather uninterested men who dismiss all history as ultimately unknowable, as equally uncertain versions, and, finally, as supremely irrelevant to the likes of them. What exactly is involved in this untypicality, this major departure?

One can only speculate at several levels. It can denote a final failure of hope in the heroic, redemptive exercise, in the possibility of nation building. It may be a criticism of the Hindu masses who have forever stayed away at decisive moments in wars, have never identified themselves with the nation. It can, on the other hand, indicate a recognition of the autonomy of the imaginative domain. The Brechtian alienation device, the underlining of the fictional nature of the work by talking about "novels and fictions" may point to the constructedness of all writings, historical and fictional. Or is it, after a long gap, and after many changes, a return to the theme of *Samya* which, in the meantime, had been overtaken by dreams of Hindu glory? Does it question the materiality of notions like political freedom and nationhood in the context of the everlasting peasant problem and ground the failure of the nation in the disjunction between the two?

Bankim thus formulates and fills out a violent Hindu agenda and immediately proceeds to deconstruct it. He powerfully projects religious militancy as a resolution to the problem of colonisation. He has an equally powerful certainty about its untenable future. It is inevitable, then, that he has to simultaneously underscore the agenda in intensely heightened colours, to proclaim its message with a brutal stridency that nearly reaches a breaking point in the last novel: and immediately counterpose to it an alienation device that drags the shining vision of Hindu triumph into the realms of idle rumour and gossip.

Notes

1 In the recent literature on Bankim in English, the shifts in stance have hardly been recognised, and Bankim's writings are treated as a monolithic whole. An exception to this tendency is Tapan Raychaudhuri, *Europe Reconsidered: Perceptions of the West in Nineteenth Century Bengal*. Delhi, 1988.

2 Tanika Sarkar, 'Bankimchandra and the Impossibility of a Political Agenda: A Predicament of Nineteenth Century Bengal', article forthcoming in Kaul and Loomba (eds), *Oxford Literary Review*

8 Partha Chatterji has completely ignored Bankim's novels as important ways of negotiating with political themes. Even the reading of the discursive prose is severely limited by a literal reading of texts in complete disregard of his literary strategies and devices that were significantly deployed here. See *Nationalist Thought and the Colonial World: A Derivative Discourse*, Delhi, 1988. Sudipta Kaviraj, in a series of unpublished monographs on various texts of Bankim, has also chosen to read each text as a fairly isolated, autonomous unit, although he is extremely sensitive in his reading strategy

9 Tanika Sarkar, op cit.

10 *Anandamath* (first published 1882, fifth and final version, 1892); *Debi Choudhurani*, 1884; *Sitaram*, 1887 The two discursive essays are, *Krishnacharitra*, 1892; *Dharmatattva*, 1888. Two incomplete manuscripts were posthumously published: his commentary on *Shrimadbhagavat Gita* in 1902 and *Devatattva O Hindudharma*, 1938. Since both were incomplete and since Bankim extensively revised his writings before the final publication, I have not made any use of them here.

11 Whereas in DT(ibid), the master and the disciple proceed through arguments and counter-arguments, in RSS daily training sessions, small boys are told stories which have the right messages. Since stories need a suspension of disbelief and questions by their very form, listeners get used to silent and implicit acceptance.

38 See my 'Rhetoric against the Age of Consent', op cit. Dipesh Chakrabarty has recently reiterated the logic and politics of this revivalism in the same terms in his critique of contemporary 'secular feminists' in 'The Difference Deferral of (A) Colonial Modernity: Public Debate on Domesticity in British Bengal' in *History Workshop*, Special Issue, Autumn, 1993.
39 See my *Bankimchandra and the Impossibility of a Political Agenda*, op cit.
40 Themes of Hindu history and nationhood were taken up in *Prabandha Pustak*, op cit. Many of the concerns of *Dharmatattva* and the form of its presentation had been anticipated in *Gaurdas Babajir Bhikshar Jhuli*, *Vividha Prabandha* (1874). *Krishnacharitra* was originally written to form a part of *Vividha Prabandha*, but was later much altered and extended. Bagal, 'Introduction', *Bankim Rachanabali*, Vol 2, op cit, p 21.
41 This is explicit in both *Krishnacharitra* and *Dharmatattva*. The latter, in fact, begins with the theme of poverty and hunger—a deliberate invocation of his earlier concerns. Then the guru persuades the disciple that both can be overcome by the cultivation of the right Hindu disposition and knowledge. He thus relocates the roots of these problems within the individual disposition and mindset—away from social structures. *Dharmatattva*, *Bankim Rachanabali*, Vol 2, op cit, pp 585-86.
42 'Sankhyadarshan' in *Vividha Prabhandha*, op cit.
43 "Vaidic religion lacks the concept of devotion.. there are only propitiatory sacrifices to attain one's earthly desires". *Dharmatattva*, *Bankim Rachanabali*, op cit, p 623. It polemicises against all major Hindu religious philosophies to assert the correctness of the reoriented bhakti.
44 See his strong repudiation of this form in *Krishnacharitra*, op cit. He was also critical of the quietism of Kali-based devotion that his contemporary saint Ramakrishna preached. See Sumit Sarkar, 'Kaliyuga, Chakri and Bhakti' in *Economic and Political Weekly*, July 18, 1992

66 Ibid, p 768
67 This was especially evident in the way the Vishwa Hindu Parishad ideologues simultaneously evoked the figures of the serene and the angry Ram. See Pradip Kumar Datta, 'VHP's Ram: The Hindutva Movement in Ayodhya' in Gyan Pandey (ed), *Hindus and Others: The Question of Identity in India Today*, Delhi, 1993. The other, very important point this article establishes is the way Ram is invoked as a role model. In bhakti philosophies, however, the deity's life is an object of contemplation for the devotee, it is not for emulation. Here, too, Bankim makes the crucial transition, by insisting that Krishna's life provides the desired pattern for all Hindus.
68 *Anandamath*, op cit, p 726.
69 In his interview with the VHP mohunt at Ayodhya, P K Datta was told that this movement is the essence of Rambhakti. Datta, op cit.
70 *Anandamath*, op cit, p 751.
71 For a discussion of these themes at the time of the founding of the RSS, see Sumit Sarkar.
72 The agenda of the war with the Muslim always occurs only in the novels.
73 This is the concluding note and message of *Anandamath*, *Bankim Rachanabali*, Vol 1, op cit, p 787.
74 "By imbibing these principles... the Hindu will be... as powerful as the Arabs in the days of Mohammad...", *Dharmatattva*, op cit, p 647.
75 Ibid, p 648.
76 Ibid.
77 This is the image of Mohammad in a very well known western text that was much used in Bankim's time. See T P Hughes, *Dictionary of Islam*. First published 1885, Indian edition, Rupa Publishers, 1988.
78 *Krishnacharitra*, *Dharmatattva* and *Anandamath* have to argue hard against other models of bhakti.
79 By asserting that with a correct application of bhakti, Hindus will be transformed into Muslims of Mohammad's time, (see above) Bankim hoped that the reinterpreted life of Krishna will play the same historic role as the original pattern.
80 There are references to an attack on missionaries at Tarakeswar in 1891. *Dainik O Samacharchandrika*, April 19, 1891. There were other minor attacks that were reported from Calcutta and Bankura. See *Report on Native Papers*, Government of Bengal, January to March 1891.

DISCUSSION

In Tune with Brahminical Legacy

Curtailing Debate by Invoking 'Karma'

N Venugopal

REACTING to my critique of the traditional sciences congress ('Learning from a Legacy: How and What', February 5) L Kannan ('Traditional Sciences and Technology', June 11) started off by saying that my way of looking at things "precludes any meaningful debate". I wonder if Kannan treats his own intervention as meaningless, since my piece at least did not preclude his debate!

Kannan's is as brahminical a piece as can be, not only in skirting around the real issues, but also in using choicest epithets against the adversary. Brahminism has developed over-killing as an art: it has 'sahasranama' to praise and as many abuses to denounce. In the same manner, Kannan used words and terms like disappointing, inadequate, effete intellectual reflex, archaic doctrinaire goggles, juvenile, gross lack of under-standing, paranoia, amusing, antiseptic talk, hogwash, armchair intellectual, slavish adherence to alien ideological baggage, petrified time warp, shibboleths, voodoo, intellectual underworld, etc, against me, my critique and my point of view.

However, this is besides the point. I do not want to dwell more on this. Though Kannan seems to think he had given a fitting reply to my article, there was no direct reference to any of the issues raised by me except the choice of the term 'traditional' rather than 'people's'. Hence it falls upon me to put the debate in proper perspective.

At the risk of repeating myself I would like to recapitulate the major themes of my article:

(1) Positive and negative aspects of the congress: While recognising the congress as "one of the landmark achievements of the movement in search of our roots" on one hand, I raised "questions regarding what was traditional and why a selected portion of the traditional was being invoked", on the other. Kannan does not seem to understand this approach.

(2) The question of context: In the atmosphere of growing Hindu communalism, the forces of Hindutva are aggressively in search of new pastures. Science and technology suits the bill in two ways: one, it is given excessive importance in India so much so that you can pass off most unscientific and abominable issues under the name of science and technology. Two, given the nature of science and technology establishment in India being predominantly brahmin-dominated, it is very comfortable to speak in terms of tradition and revival without any threat to the entrenched classes/castes.

(3) Absence of several significant trends in the Indian traditions: I have shown that the congress of traditional sciences left scope to be regarded as a brahminical one (which could have been easily avoided) by ignoring important trends.

(4) Caste question: The congress behaved as if there was no caste oppression in India, and some of the prominent speakers were arguing in favour of a revival of not only traditional science and technology but also traditional social system. I contemplated with fear, the consequences of this revival for women and lower castes. Now Kannan enhances my fear dismissing the 'caste oppression', and women's exploitation and inequality as dark shibboleths and colonial voodoo.

The same issue in which Kannan's piece appeared carried a case of a dalit being forced to eat his own excreta. I am not sure whether this is 'colonial voodoo' and 'flying in the face of facts'.

(5) Finally, and basically, I asked for a clear perspective of the congress.

Apart from this restating of my earlier argument I would like to take issue with Kannan regarding the following: Kannan seems to be ignorant of differences between the two concepts known as popular sciences and people's science. A condescending exercise to make modern science intelligible to ignorant masses is not people's science, as Kannan thinks. He would do better if he went through the debate that went on about the differences.

One can only wonder as to how a scholar like Kannan, who brings Feyerabend to support him, could say that an "act of defining can only be undertaken as a post-mortem not something living and dynamic". There are two problems here: one, then nothing can be defined; two, if it is tradition which is living and cannot be defined, then where is the scope for revival. Does not Kannan think he is contradicting himself?

Whether I am paranoid about science getting tainted with religious overtones or not, it was C V Sheshadri, whom Kannan equates with Pythagoras and Ramanujan, who mentioned about the religious taint of tradition. I was only referring to him. I have shown how the congress was allowed to get this taint.

Kannan does not seem to distinguish between abstraction and mysticism. No knowledge system develops without some kind of generalisation and abstraction, which is miles away from mysticism. All the phenomena have been abstracted in the form of concepts to arrive at a better understanding of nature and society. There is nothing by the name of 'tree'; there are only different trees. A general concept of 'tree' was evolved out of observing thousands of real, particular trees. Whereas this abstraction helped in the growth of knowledge, mysticism, which seems to be a favourite of Kannan, is prone to treating phenomena as 'maya', 'mithya' and 'karma' and hence leads to armchair theorisation to make it more and more incomprehensible.

I agree that Dharampal's views expressed elsewhere should not be brought into focus when discussing the congress on traditional sciences. But the Babri masjid demolition and the congress fall in same genre in that both of them attempt a redefinition of tradition. But, I think, these attempts should have led to diametrically opposite directions, and if Dharampal becomes the high priest in the congress also, I am afraid the same kind of demolition takes place here as well. Which, indeed, it did. Except sanskritised, brahminical Hindu, male definitions, all others were attempted to be erased.

Kannan quoting Deng approvingly strengthens my suspicion about the organisers' stress on utilitarian aspect of tradition. This is nothing but going into the quantitative value system of modern S and T.

Besides all this, it is very much disturbing when Kannan says that "the discourse now needs to be carried forward to address larger questions like the reorganisation of society and polity". There is no denying that the present society and polity badly need reorganisation. However, the reorganisation is needed to do away with "caste oppression, women's exploitation, inequality", and oppressive agrarian relationships, among so many other evils. But, if people like Kannan, who refuse to see this oppressive present, appoint themselves as managers of this reorganisation, I wonder what would happen to our society and polity. (Maybe *Gita* and *Manusmriti* will become our official guides!)

Kannan's scrutiny of "the very notions of equality" and his analogy of a volleyball team are ridiculous in the least. When vast

masses have been subjected to untold suffering for hundreds of years, with the unambiguous sanction from sacred books and religious heads, and at a time when the oppressed are coming to fore to demand their minimum human rights, such as dignity and equality of opportu'very notion of equality' with highly sophisticated arguments.

Kannan seems to think the superiority of brahmins and inferiority of others is justified because of their 'swabhava', "innate physical and psychological characteristics". He sounds like Puri Shankaracharya who said that women ought to be inequal, and other Hindu ideologues who attribute socio-economic inequality to innate physical and psychological characteristics.

Kannan appears to be a perfect sophist in the best tradition of Hindutva. He refers to some bad examples from history of modern India about scientific temper (it is another concept sabotaged by the rulers of modern India like public sector), and then concludes "an inverse correlation between scientific temper and scientific creativity". Nothing can be more silly. Does Kannan suggest that the more irrational and superstitious, the more creative?

Once again I would like to stress the need and importance of learning from legacy. It becomes significant in post-colonial situations. However, in a society like India where Hindu religious and brahminical order has hijacked the legacy of people, one has to be careful in defining, identifying, selecting and following the 'traditions'. As rightly mentioned by Kannan, China did attempt such a revival when it blended acupuncture and modern medicine. But what Kannan seems to forget is that the same China not only did not accept Confucian ideology in the tradition but also undertook a vehement fight against that part of feudal past. Similarly, I think, a revival of traditional sciences and technologies of our artisans is very much needed, but with a conscious rejection of and struggle against the ideology of Manu and swabhava and 'swadharma'. Our people have had enough of it.

Real Challenge before the Sikhs

Sharad Patil

GOPAL SINGH, in his challenging contention that the Sikhs are a nationality (July 16, 1994), has conveniently bypassed the original caste annihilatory objective of the Sikh gurus.

Religious Nationalism

In his attempt to build his case of Sikh religious nationalism, he has cited extensively from G Adhikari's booklet *Sikh Homeland* (1945). Lenin and Stalin, on whom the undivided CPI based its policy on Indian nationalities, had never considered religion to be a factor in the making of a nation or nationality. But to appear more 'secular' than the Congress nationalists and socialists, the CPI supported religious nationalism, not only of the Sikh elite, but also of the Muslim elite by espousing Pakistan, with the difference that it did not bring out a similar booklet called *Muslim Homeland*. Adhikari's booklet was withdrawn from circulation before it could do greater damage.

Pakistan came into being on the basis of religious nationalism. But when its west Pakistani rulers tried to impose Urdu on the then east Pakistan, the cyclone of linguistic nationalism broke out, which, drowning religious nationalism, gave birth to the present Bangladesh. Today its Muslim fundamentalists are persecuting Nasreen as the Sikh fundamentalists had tried to do with Amrita Pritam. Gopal Singh wants the Sikh religious nationalism to be unleashed in a non-secessionist way. But then he will have caught the bear, while the bear would refuse to let him go!

The demand for Punjabi Suba was based on linguistic nationalism as in the rest of India. It is true that it was opposed by the Punjabi Hindus who declared their language to be Hindi. It was unpardonable. But it should not be forgotten that those who spearheaded this anti-linguistic-nationalism campaign were high caste Hindu traders who were afraid of the sudra Sikh majority. Same was the case on the Sikh side. Gopal Singh himself admits that the low caste Sikhs were not enthusiastic about the demand for Punjabi Suba. For, they felt that the dominant peasant caste of the jats would rule the roost. Gopal Singh refers to the assassination of Indira Gandhi by her two Sikh guards in vengeance against operation Blue Star by the Indian army against the Golden Temple. Though he does not mention that they were Sikh SCs, this identity is played up to show that the Sikhs are a homogeneous community. But is it the whole truth? One of the bench of Supreme Court judges who awarded capital punishment to the so-called assassins publicly admitted after his retirement that they were innocent. The powers that be who hired the assassin to fire from the shoulder of one of the guards were interested in provoking anti-Sikh riots all over the country and thus further stoke the fires of Sikh extremism. Bhishma had warned Yudhishthira that internal danger is incomparably more disastrous than the outer danger (XII-107-28).

Ethnic Nationalism

Gopal Singh derives support for his argument that the Sikhs are an ethnic group in K R Bombwall's admission. Can it stand the test of history? The word ethnic originally denoted heathen, pagan, gentile, non-Israelite, non-Christian. With the establishment of ethnography, it came to mean people belonging to a common racial or ethnic stock. The most well known history of the Sikhs is by Khushwant Singh, himself a Sikh. He takes the origin of the Punjab nation to the Mahabharata times by quoting Karna-parva, verses 2063-2068— "...No Aryan should stay in Punjab for even two days", because the Punjabis refused to obey the priests.[1] Of course, the epic does not use the word 'Punjab' at all. In fact, the region was not called Punjab at least during the Vedic period. It is obvious that Singh's conception of Indian history is linear. During the epic period (BC 1000-800) Punjab was inhabited by rajakas (monarchical tribal republics), many of which were matrilineal, and aboriginal tribes from whom communal slaves were recruited by the rajakas. Kekaya of the Ramayana was situated in the present districts of Jhelum, Shahpur and Gujarat, Madra of the Mahabharata occupied the Sialkot district, Bodha was located in eastern Punjab, Sibi in western Punjab. Trigarta in Jalandhara district, etc The later a-rajaka (Sangha-gana) Arjunayanas and Yaudheyas issued coins under the legend—'Arjunayananam jaya' (Victory to the Arjunayanas), 'Yaudheyanam' jaya'.[2] Every of these ganas called itself a nation state and was in inimical (a-mitra)relation with the other ganas. The last of these oligarchies, that of the Yaudheyas, was crushed by the Guptas in AD 300.[3]

In Buddha's lifetime itself (BC 600) the new non-tribal jati system had come into existence. With the extinction of the oligarchic varna system in Punjab, the tribes became either jatis or 'scheduled tribes'. When Muhammad Ibn al-Kasim invaded Sindh in AD 712, the jats and meds were considered low untouchable castes even by the Arab conqueror.[4] According to Khushwant Singh, Punjab came into being after, and as a result of, Arabic, Turkish and other invasions:

The Punjab, being the main gateway into India, was fated to be the perpetual field of battle and the first home of the conquerors. Few invaders, if any, brought their wives with them, and most of them who settled in their conquered domains acquired local women. Thus the blood of many conquering races came to mingle, and many alien languages—Arabic, Persian, Pushto, and Turkish—came to be spoken in the land. Thus, too, was the animism of the aboriginal subjected to Vedantic, Jain and Buddhist religions of the Aryans, and to the Islamic faith of the Arabs, Turks, Mangols, Persians, and Afghans. Out of this mixture of blood and speech were born the Punjab people and their language.[5]

The jat peasantry, being looked down by the Hindu upper castes,[6] embraced Sikhism and formed its backbone.[7] About the untouchable castes, apart from the backward castes, who became Sikhs, Singh says: "Prominent among 'untouchable' village communities converted to Sikhism and living in jat villages are Mazhabi, Ranghreta, and Ramdasis".[8]

Note that the villages are called 'jat villages'. Singh claims Aryanhood for the jats.[9] So the Sikh SCs and OBCs naturally belong to the non-Aryan stock. This is the ethnic identity of the present-day Sikhs.

Objective of Sikh Religion

Khushwant Singh says that "Sikhism was born out of a wedlock between Hinduism and Islam".[10] Singh himself is an admirer of the Adi Sankara.[11] That is why he denies any influence of Buddhism[12] on Nanak (born AD 1469). But he contradicts himself when he says that "A method advocated by Nanak was the gentle way of Sahaj".[13] Sahaja-yana was one of the anti-caste Tantrik sects of Buddhism, a great propagator of which was the first Siddha Sarahapa (AD 700-800).[14] Rahul Sankrityayana points out that the Maharashtrian saint Jnanesvar (AD 1300) arose in the direct tradition of Sarahapa.[15] This Bhakti tradition was taken by the saint Namadeva to Nanak. The point I wish to make in this context is that because all present-day progressive and Marxist historians, except a few, ignore or underplay the basic anti-caste current of Indian history, its impact on politics has led to disastrous results. If Sikhism was pre-eminently a syncretic religion, how is it that, as Singh admits, "His (Nanak's) teaching appealed specially to the politically downtrodden Hindus of the lower castes and the poor of the Muslim peasantry?"[16] Though the Muslim saints and mystics observed in their lives the tribal poverty and equalitarianism of the prophet and preached religious tolerance, they did not raise their voice against the caste system. That is why Akbar, the greatest of Muslim kings, can be compared, according to Savitri and Satish Chandra, with Tulasidas, the sudra-hating brahmana saint, but not with Dadu, the anti-caste cobbler saint.[17] Kabir was no more a Muslim when he preached against the caste system. It fell to revolutionaries like Nanak to preach and work for anti-caste equality. Singh is constrained to observe:

> The Bhaktas had paid only lip-service to the ideal of a casteless society; Nanak took practical steps to break the vicious hold of caste by starting free community kitchens—guru ka langar—in all centres and persuading his followers, irrespective of their castes, to eat together. Nanak's writings abound with passages deploring the system and other practices which grew out of caste concepts, particularly the notion held by brahmins that even the shadow of a low-caste man, on a place where food was being cooked, made it impure...[18]

The later Sikh gurus carried this anti-caste heritage forward. Guru Gobind Singh taught: "*manaski jat sab eka hi pahacanbo*" (know all mankind as one caste).[19]

But could this abolish the caste system?

Real Challenge

'Caste Annihilation' (1936) was the real task before B R Ambedkar, the greatest untouchable of India. The time was ripe for its fulfilment. That is why he declared in 1936 that though he was born in the Hindu religion, he would not die in it. And then leaders of all religions in India approached him. Among them were also Sikhs. He sent a delegation to Punjab to see the religion in practice. On return it told him that the religion has its own untouchable castes. That is why he repeatedly stressed that untouchability can be abolished only with the abolition of the caste system.[20]

Factional struggle between the Jat Darbara Singh and the backward Zail Singh in Congress is said to have helped the fundamentalist rise of Bhindranwale. But it cannot be the root cause of the rise of fundamentalism. The low caste Sikhs were gravitating slowly but surely towards the Nirankari sect, and to put a stop to this drain on the main Sikh religion Bhindranwale started his murderous attacks on the sect. The Sikh extremism that has rapidly grown since then has managed to divert the internal discontent of the Sikh SCs and OBCs to confrontation against the so-called Hindu majority oppression.

The SCs or dalits are far greater victims of the upper caste Hindu oppression than the Sikhs. Ambedkar preferred the non-violent Buddhist religion to all other relatively militant religions not only because it was the most anti-caste religion, but also because it was a mainstream Indian religion. He did not want the dalits to get alienated after religions conversion from the caste-ridden Hindus as the dalits converted to Islam and Christianity had become, but play the vanguard role in the impending caste-annihilatory democratic revolution.[21]

It is a peculiar sight to see a low caste Sikh pilgrim, returning after his visit to the Manmad Gurudwara to the station, bowing before the statue of Ambedkar in front of the station. This duality in devotion is spreading among the dalits of all Indian religions. No fundamentalist extremism can stop it.

The real challenge before the Sikh community is to complete the unfinished caste-annihilatory work of the great gurus. It is the surest way to isolate and defeat the upper caste-class Hindu oppressors.

Tourism Finance Corporation of India Ltd.

(Incorporated on 27th January, 1989 under the Companies Act, 1956).
Regd. Office : Core V, Scope Complex, 7 Lodhi Road, New Delhi - 110 003. Fax : 011-4361534

HIGHLIGHTS

- Maiden Public Offer by a Specialised All India Development Financial Institution catering to requirements of tourism industry.
- Tourism industry has emerged as one of the largest foreign exchange earners and major provider of employment. A mega industry world wide poised for rapid growth.
- A notified Public Financial Institution U/S 4A of the Companies Act, 1956
- Promoted by IFCI alongwith other All India Financial Institutions and Nationalised Banks.
- Provides a wide range of financial assistance to enterprises for setting up and/or development of tourism related activities
- Sound operational performance, comfortable capital adequacy ratio of 27% and high growth rate of earnings
- Eminent Board of Directors comprising representatives from Government of India, Reserve Bank of India, Financial Institutions, Tourism Industry, Professional Experts, Academicians etc.
- Easy liquidity- Listing proposed at Delhi, Bombay, Ahmedabad and Madras Stock Exchanges.

Investors may note that in case of oversubscription the allotment shall be on proportionate basis in consultation with Delhi Stock Exchange.

RISK FACTORS

INTERNAL TO THE COMPANY

- Interest Rate Risk - The Company may face certain risk due to fluctuations in the interest rates.
- Liquidity Risk - The Company may face liquidity problems due to mismatch in maturity between its assets and liabilities
- Projects financed by the Company may encounter delays in implementation, overruns and in few cases, failures as well, which may result in defaults or delay in recovery of dues.
- As on 31st March, 1994, Sundry Debtors include Rs.600 lakhs due from Fairgrowth Financial Services Ltd (FFSL) and Rs. 400 lakhs due from Fairgrowth Investments Ltd. (FIL) against unfulfilled obligations of these companies. A petition has been filed with the Special Court in respect of dues from FFSL and is pending disposal. In the case of FIL, restrictions have been imposed by RBI from making payment to creditors.

EXTERNAL TO THE COMPANY

- Any decline in tourist traffic may affect the performance of the company.

Public Issue of 1,70,00,000 Equity Shares of Rs. 10/- each for cash at a premium of Rs. 20/- per share aggregating Rs. 5100.00 lacs

Issue Opens on 26th Sept., 1994

- With disintermediation in the financial sector, the Company may face competition.

MANAGEMENT'S PERCEPTION OF THE RISK FACTORS

- The Company's lending rates are fixed keeping in mind the incremental cost of funds
- The Company follows a careful approach in regard to liquidity. It maintains a comfortable debt service coverage ratio and has always met its obligations on the due dates in the past.
- The Company hedges against such credit risks by adopting a conservative lending policy and following prudent exposure limits for individual clients as well as for group concerns
- Being a specialised institution with its highly professional team the Company is able to provide timely and efficient services to its clients and could adopt flexible policy framework suited to the specific requirements of tourism industry. The Company has been associated with more than 90% of the tourism projects assisted by Institutions after the setting up of TFCI.
- Based on the available details, confirmation of securities held in trust, commitments and audited balance sheet of FIL & FFSL, the management is confident of ultimate realisation of the sums due. However, as a measure of abundant caution, a sum of Rs. 200 lakhs was transferred to Special Reserve during the year ended 31/3/93 to cover any shortfall that may arise (net of taxes) on the aforesaid dues. A further provision of 10% i.e. Rs. 90 lakhs has been made during 1993-94 in respect of the above dues which is included in the provision for doubtful debts under Section 36(1) (viia) of the Income Tax Act, 1961. Further, consistent with prevailing Accounting Standards interest accrued on the dues has not been recognised as income.

If the Company does not receive the minimum subscription of 90% of the issued amount, including devolvement of underwriters within 60 days from the date of closure of the issue, the Company shall forthwith refund the entire subscription amount received. For delay beyond 78 days, from the date of the closure of the issue in refund of such subscription, the company shall pay interest @ 15%p.a. If there is delay in the refund of the amount collected, the company & the directors of the Company shall be jointly and severally liable, to repay the amount due by way of refund with interest @ 15% p.a for the delayed period beyond 78 days from the date of actual closure of the issue

Note : Investors are advised to refer to the para on the "Justification of premium" before making a decision to invest in the issue.

REGISTERED OFFICE : Block 7, 6th Floor, Topaz Complex, Panjagutta, Hyderabad-500 482

Tel : 313407 Grams : VISTA PHARM Fax: 040-313407

PUBLIC ISSUE OF 37,50,000 EQUITY SHARES OF Rs. 10/- EACH FOR CASH AT PAR AGGREGATING Rs. 3,75,00,000/-

Equity participation by IDBI
20th Century Mutual Fund and
Kothari Pioneer Blue Chip Fund

HIGHLIGHTS

1) 100% EOU eligible for income-tax exemption on earnings under Section 10 B of Income-Tax Act of 1961.
2) Promoted by a qualified technocrat NRI entrepreneur with 20 years of experience in the Pharmaceutical Industry and his NRI associates.
3) Project assisted by IDBI (Term Loan Rs. 305 lacs), APIDC (Equity Rs. 45 lacs) and State Bank of Hyderabad (Working Capital limit Rs. 140 lacs).
4) Equity participation by IDBI (Rs. 10 lacs), 20th Century Mutual Fund (Rs. 30 lacs) and Kothari Pioneer Bluechip Fund (Rs. 10 lacs) by way of firm allotment out of Public issue.
5) Plant designed for manufacture of formulations conforming to Food and Drugs Administration (USA) standards.
6) Firm marketing arrangement with US Generic of USA, a subsidiary of Scientific Instruments and Technology Corporation of USA.
7) Locational advantage - Unit coming up in State notified backward area.
8) Low Cash break-even level of 21%.
9) Commercial Production by November, 1994.
10) Tax benefits under section 80L & 80M of Income Tax Act and Wealth tax benefits.
11) Easy Liquidity - Listing at Bombay and Hyderabad Stock Exchanges.

Investors may please note that in the case of oversubscription the allotment shall be on proportionate basis.

RISK FACTORS

INTERNAL

1. The Company is yet to get formal sanction of power from APSEB.
2. The Company is yet to receive the State Subsidy.
3. The company is yet to obtain the approval of the Food and Drugs Administration. U.S.A.
4. There has been delay in implementation of the project. The project will now be completed by November 1994.

EXTERNAL

1. The Company imports bulk drugs for the manufacture of Formulations. Any changes in the Government policy regarding imports and the exchange value of the rupee may affect its operations.
2. Fluctuations in prices of the Company's products could affect the Company's profitability.

MANAGEMENT PERCEPTION OF RISK FACTORS

INTERNAL

1. The company has made adequate provision for Generator sets which will meet the full requirement of power.
2. The state subsidy was sanctioned by District Industries Centre, Nalgonda, Andhra Pradesh vide their letter No. 3444/14/B/92-294 dated 4-5-92. The subsidy will be received within 6 months of commencement of commercial production.
3. The Company's profitability projections are based entirely on the manufacture and marketing of OTC drugs, which can be marketed in the USA by registering with the FDA and to other countries without any approval. FDA approval is required only for Prescription drugs and the company has initiated the process of obtaining the same. Any delay in receipt of FDA approval will not adversely affect the profitability of the company.
4. There is no cost overrun consequent to delay in implementation of the project.

EXTERNAL

1. Since the Company will be exporting its products and will be a net foreign exchange earner, the effect of the foreign currency fluctuations will be minimised.
2. The Company has an edge in the international market because of the experience of the promoters in the US Pharmaceutical Industry and the lower cost of production in India. Off-patented prescription drugs, yielding higher margins, are also proposed to be manufactured. Hence, the Company is confident of achieving the profitability projections.
